NOTICE
CUMULATIVE INDEX(ES)
PUBLISHED SEPARATELY

PUBLISHED MONTHLY BY
THE AMERICAN PSYCHOLOGICAL ASSOCIATION, INC.
at Prince and Lemon Sts., Lancaster, Pa. 17604 and
1200 SEVENTEENTH ST., N. W., WASHINGTON, D. C. 20036

EQUAL EMPLOYMENT OPPORTUNITY

The American Psychological Association endorses equal employment opportunity practices, and we reserve the right to edit all copy and to refuse ads that are not in consonance with the principles of Title VII of the Civil Rights Act of 1964.

Second-class postage paid at Lancaster, Pa., and at additional mailing offices.

Business communications are to be addressed to the Washington Office of the American Psychological Association. Correspondence on production and circulation matters is to be directed to the Managing Editor; on advertising and sales, to the Advertising Manager; and on subscriptions and address changes, to the Subscription Office. Changes of address must reach the Subscription Office by the tenth of the month to take effect the following month. Copies undelivered because of address changes will not be replaced; subscribers should notify the post office that they will guarantee second-class forwarding postage. Other claims for undelivered copies must be made within four months of publication.

A READER'S GUIDE TO USING PSYCHOLOGICAL ABSTRACTS

Psychological Abstracts (PA) attempts to cover the world's literature in psychology and related topics. PA publishes abstracts of published primary documents such as technical reports, journals, and monographs. Books and separates are covered by bibliographic citation with an additional annotation if the title is not definitive.

PA is published in two volumes per year (effective January 1971), six issues per volume. A cumulative index is published for each six-month volume.

A monthly issue contains: Table of Contents (classification scheme); abstracts; list of abbreviations used in the abstracts; Author Index; and Brief Subject Index. The Brief Subject Index consists of index heading terms and abstract numbers.

A cumulative index issue contains: Table of Contents for the six-month volume; complete list of all journals regularly searched by PA; list of volunteer abstractors; list of abbreviations used in the abstracts; the cumulative author index for the six-month volume; list of subject index heading terms; and cumulative subject index for the six-month volume, which consists of index heading terms, descriptive phrases for each abstract, four-letter abbreviations indicating languages other than English and abstract numbers.

Within the monthly issue, abstracts are arranged in alphabetical order by author, categorized under the content headings as listed in the Table of Contents. The abstracts are numbered consecutively within a six-month volume.

PA's author index is intended to be a name index only and not a person index. Alphabetical rules are strictly applied, consequently, "J. Smith" and "John Smith" would appear in the index as two separate entries even though they may in fact be the same person. By the same token two entries of "J. Smith" would appear as J. Smith with two abstract numbers following it, even though they may be two different people.

The subject index heading terms are reviewed annually and revised as necessary as subjects of interest to the discipline shift and increase. For example, the term "Drug Usage and Abuse" was added to the list of terms when the increase of articles on the topic and interest in the discipline appeared to demand it. Previous to the addition of this term these articles were placed under terms such as "Drugs," "Drug Effects," "Drug Therapy," and "Drug Addiction." Conversely, as a topic decreases in popularity, it may become necessary to delete a term or combine several terms into one general term.

PA is computer-printed and because of necessary production procedures there is a possibility that on occasion the abstracts representing articles from a single issue of a primary journal may appear in several issues of PA, e.g., an issue of the *Journal of Psychology* may include 20 relevant articles; abstracts for 17 of these articles may appear in the May issue of PA, the other 3, in the June issue.

The following are examples of entries and explanations of their elements.

JOURNAL ARTICLE ENTRY

(1a) Brown, Mildred; (1b) Jones, John J., (1c) Wilson, J. T., & (1d) Carson, E. Norman. (2) (*Boston U.*) (3) Single cell activity in the hypothalamus in intact and adrenalectomized rats. (4) *Psychological Journal*, (5a) 1970(Jan), (5b) Vol. 13(6), (5c) 173-190.—(6) In this replication of a study by A. R. Arnold (7) (see (7a) PA, (7b) Vol. 42: (7c) 1791 and 45: (7d) Issue 1), 123 intact and adrenalectomized male Wistar rats were tested under urethane anesthesia. Adrenalectomy increased the mean spontaneous discharge and changed the pattern of firing of anterior hypothalamic neurons. The possible relation of these electrophysiological findings to the effects of adrenalectomy on the CNS is discussed. (8) (German & French summaries) (9) (97 ref.)—(10) *Journal abstract*.

1a-1d—Authors: Only four are listed; if there are more than four authors, the first author is listed followed by et al. Succession marks are not given, e.g., Jr., II, III, etc.

2—Address: A mailable address is included for the first-named author only.

3—Title: Article title including subtitles. If the original article is in a foreign language, that title is given, followed by the English translation in brackets, e.g., [Parapsychology].

4—Primary journal title in full.

5a—Year and month of the primary publication issue.

5b—Volume number followed by issue number in parentheses.

5c—Inclusive pagination of the article.

6—Text of the abstract.

7—Reference to a previous entry in *Psychological Abstracts*.

7a—PA=Psychological Abstracts.

7b—PA volume number.

7c—PA abstract number.

7d—PA issue number where abstract number is unavailable at time of publication. When only the issue number is given, one must consult the Author Index of the PA issue noted in order to determine the abstract number for the author and article cited.

8—Summaries included in the primary source are listed when in language(s) other than that of the article.

9—Number of references is included when 15 or more. May also appear as pages, e.g., (3 p. ref.).

10—Abstract source.

BOOK ENTRY

(1) Jones, John J. (2) (Ed.) (3) (*U. Chicago, Medical School*) (4) *Sleep and dreams*. (5) New York, N.Y.: (6) Appleton-Century-Crofts, (6a) 1970. (6b) ix, (6c) 396 p. (6d) \$6.50(cloth), (6e) \$2.50(paper).

1—Name of author(s) or editor(s). If more than four authors, the first author is listed followed by et al. Succession marks are not given, e.g., Jr., II, III, etc.

2—Designation of editor.

3—Address of first-named author/editor only.

4—Book title.

5—Place of publication.

6—Publisher's name.

6a—Year of publication.

6b—Prepagination.

6c—Total pagination.

6d—Hardcover price.

6e—Paperback price.

BOOK CHAPTER ENTRY

(1) Wilson, J. T. (2) (*U. California, Santa Cruz*) (3) *The stages of sleep*. (4) In (4a) J. J. Jones (4b) (Ed.), (4c) "Sleep and dreams." (5) (See (5a) PA, (5b) Vol. 45: (5c) Issue 1) (6) 17-47.

1—Author(s) of chapter cited. If more than four authors, the first author is listed followed by et al. Succession marks are not given, e.g., Jr., II, III, etc.

2—Address of first-named author only.

3—Chapter title.

4—Reference to entry in PA which includes bibliographic information for the whole book. When only the issue number is given (see 5c), one must consult the Author Index of the PA issue noted in order to determine the abstract number for the Editor of the book.

4a—Editor's name.

4b—Editor designation.

4c—Book title.

5—Referral information.

5a—PA=Psychological Abstracts.

5b—Volume number.

5c—Issue number.

6—Inclusive pagination for cited chapter.

ABBREVIATIONS

Abbreviations appearing in this issue include along with units of measurement (e.g., in. = inch, wk. = week, hr. = hour, etc.):

AA = Alcoholics Anonymous
 AC = alternating current
 ACTH = adrenocorticotrophic hormone
 AM = ante meridiem
 amp. = ampere
 bpm = beats per minute
 C = centigrade
 ¢ = cents
 CA = chronological age
 cc = cubic centimeter
 CER = conditioned emotional response
 CFF = critical flicker frequency
 CNS = central nervous system
 cps = cycles per second
 CR = conditioned response (or reflex)
 CRF = continuous reinforcement
 CRT = cathode ray tube
 CS = conditioned stimulus
 CVC = consonant-vowel-consonant
 db. = decibel
 DC = direct current
 DL = differential limen
 DNA = deoxyribonucleic acid
 DRL = differential reinforcement of low rates

E = experimenter
 ECS = electroconvulsive shock
 EEG = electroencephalogram (or -graphy)
 EKG = electrocardiogram
 EMG = electromyogram
 ESP = extrasensory perception
 Exp. = experiment

F = Fahrenheit
 ft-c = foot-candle
 ft-L = foot-lambert

g = gravity
 gm. = gram(s)
 GPA = grade-point average
 GSR = galvanic skin response

Hz. = Hertz

ICS = intracranial stimulation
 im = intramuscularly
 ip = intraperitoneally
 IQ(s) = intelligence quotient(s)
 ITI = intertrial interval
 iv = intravenously

kc. = kilocycle
 kg. = kilogram
 kg/m = kilogram per meter
 kHz. = kilo-Hertz

LD = lethal dose
 LSD = lysergic acid diethylamide

m. = meter
 M = mean
 M = mole or molar
 ma. = milliamperes
 MA = mental age
 MAO = monoaminoxidase
 mL. = millilambert
 mm. = millimeter
 mph = miles per hour
 msec. = millisecond(s)

N = number
 NREM = nonrapid eye movement

O = observer

p = probability
 % = percent

PM = post meridiem
 pps = pulses per second
 PRE = partial reinforcement effect
 PSE = point of subjective equality
 psi = pounds per sq. in.

r = product-moment correlation
 r = roentgen
 REM = rapid eye movement
 rms = root mean square
 RNA = ribonucleic acid
 rpm = revolutions per minute
 RT = reaction time

S = subject
 SEU = subjectively expected utility
 SPL = sound pressure level

TV = television

UCR = unconditioned response
 UCS = unconditioned stimulus
 UHF = ultrahigh frequency

V = volt
 VHF = very high frequency
 vs. = versus

YMCA = Young Men's Christian Association
 YWCA = Young Women's Christian Association

Test abbreviations include:

California E Scale (Ethnocentrism)
 California F Scale (Fascism)
 CMA scale = Children's Manifest Anxiety scale
 CPI = California Psychological Inventory
 CTMM = California Test of Mental Maturity
 EPPS = Edwards Personal Preference Schedule
 MA scale = (Taylor) Manifest Anxiety scale
 MMPI = Minnesota Multiphasic Personality Inventory
 MPI = Maudsley Personality Inventory
 16 PF = Cattell's 16 Personality Factor Questionnaire
 SVIB = Strong Vocational Interest Blank
 TAT = Thematic Apperception Test
 WAIS = Wechsler Adult Intelligence Scale
 WISC = Wechsler Intelligence Scale for Children

Abbreviations used in authors' addresses are:

Assn. = association
 Assoc. = associates
 Co. = company
 Coll. = college
 Corp. = corporation
 Dept. = department
 Div. = division
 Inst. = institute
 Hosp. = hospital
 Lab. = laboratory
 Inc. = incorporated
 U. = university

Ave. = avenue
 Bldg. = building
 Blvd. = boulevard
 Ct. = court
 Dr. = drive
 Ft. = fort
 Mt. = mount
 Pkwy. = parkway
 Pl. = place
 PO = post office
 Rd. = road
 St. = street
 N, S, E, W = North, South, East, West
 U.S. = United States
 USSR = Union of Soviet Socialist Republic

Psychological Abstracts

VOLUME 46

JULY 1971

NUMBER 1

GENERAL

OBITUARIES

1. Arlow, Jacob A. (120 W. 59th St., New York, N.Y.)
Bertram D. Lewin: 1896-1971. *Psychoanalytic Quarterly*, 1971(Jan), Vol. 40(1), 1-4.—Presents an obituary of a leading psychoanalyst and co-founder and editor of *Psychoanalytic Quarterly*. J. Z. Elias.

HISTORY

2. Cleghorn, R. A. (McGill U., Montreal, Quebec, Canada) **The shaping of psychiatry by science and humanism: II. An emerging synthesis of science and humanism.** *Canadian Medical Association Journal*, 1970(Oct), Vol. 103(9), 933-941.—Presents an outline of the growing balance between humanism and science in psychiatry. Various studies in the field of medicine have become applicable to vital psychiatric problems. The implications for psychiatry of the growing development of modern knowledge of the sympathetic nervous system and the adrenal medulla and cortex are discussed. The assessment of the incidence of mental disturbance and altered EEGs noted in Addison's disease by G. L. Engel and S. G. Margolin is seen as breaking the somatic barrier. Subsequent studies of the catecholamines, serotonin and mental states, metabolic changes in depression, psychopharmacology, neurophysiology, and the interaction of environment and sex are noted. The contemporary relevance of psychoanalysis and the psychosocial aspects of diseases are considered. It is concluded that while "the basic sciences of biochemistry, physiology and genetics are combining to propel psychiatry closer to the mainstream of medicine... we must not lose our concern for the humanistic needs of our patients." (78 ref.).—S. Knapp.

3. Hall, Elizabeth. **Alfred Adler: A sketch.** *Psychology Today*, 1970(Feb), Vol. 3(9), 45, 67.—Adler's earliest recollections concerned his own or his brother's sicknesses. After becoming a physician, he joined Freud's group, but in 1911, he and 9 of the 23 other members left. Adler and Freud never agreed "on the role of early sexual trauma in mental illness or on dream analysis." After being forced to leave Austria by the Fascists, Adler settled in New York. He died on a lecture tour in 1937. There are active groups and a journal furthering his approach to personality.—E. J. Posavac.

4. Nassefat, Morteza. **La psychologie et l'épistémologie de Jean Piaget.** [The psychology and epistemology of Jean Piaget.] *Bulletin de Psychologie*, 1969-1970, Vol. 23(4-5), 177-188.—Presents an overview of Piaget's work of 6 decades and approximately 450 publications, and an examination of its biological and philosophical origins. Greatest coverage is given to Piaget's work in developmental and genetic psychology from 1922-1949.—R. E. Smith.

PHILOSOPHY

5. Baumrin, Bernard H. (Lehman Coll., City U. New York) **The immorality of irrelevance: The social role of science.** In F. F. Kortzen, S. W. Cook, & J. I. Lacey (Eds.), "Psychology and the problems of society." (See PA, Vol. 46:Issue 1) 73-83.

6. Rossi, Remo. (United States International U., San Diego, Calif.) **A soliloquy on man's presence: An existential exploration of homelessness and anonymity, longing and fulfillment as dimensions of the idea of presence in this modern age.** *Dissertation Abstracts International*, 1970(Oct), Vol. 31(4-B), 2264-2265.

PARAPSYCHOLOGY

7. Rogo, D. Scott. **The transference of mediumistic control.** *Parapsychology Review*, 1970(May), Vol. 1(2), 15-17.—The "control" or spirit "guide" is usually interpreted as a secondary personality of the medium. This view, however, does not account for instances where the "control" transfers from one medium to another, or several control personalities in different mediums communicate incomplete messages that must be pieced together to be understood. Instances of such transference and cross-correspondence are reviewed, and it is concluded that explanations other than a survivalistic theory cannot cope with the phenomena.—P. F. Grim.

8. Stevenson, Ian. **Precognitions of disasters.** In H. S. Abram (Ed.), "Psychological aspects of stress." (See PA, Vol. 46:Issue 1) 3-28.

9. Turner, Ralph H. (Oberlin Coll.) **Parapsychology: A topic illustrating basic concepts in psychology.** *Psychological Record*, 1970(Fal), Vol. 20(4), 505-508.—Tradition suggests starting with basic scientific principles and later showing how they can be applied. To capitalize on the recent emphasis upon "relevance," one might start with a topic that is inherently interesting and introduce scientific principles where appropriate to the discussion. 1 example is presented. The technique may be expanded so that scientific principles always are taught within the context of an interesting problem-oriented discussion.—*Journal abstract*.

THEORY & SYSTEMS

10. Couzin, Robert. **Leibniz, Freud, and Kabbala.** *Journal of the History of the Behavioral Sciences*, 1970(Oct), Vol. 6(4), 335-348.—Leibniz' efforts in and sympathy for the spirit of Kabbalistic science make the equation of Allport's Locke-Leibniz and Bakan's behaviorism-psychoanalysis dichotomies considerably more creditable. Allport's doubts notwithstanding, many of Leibniz' conceptions bear close affinities to those of Freud, e.g., the petites perceptions of the monad may well be viewed as a precursor to Freud's discovery—or revival—of the unconscious. Perhaps most striking is

Leibniz' anticipation of Freud's teleology of concrete psychological acts.—C. M. Franks.

EDUCATION & TRAINING

11. Arthur, Artur Z. (Queen's U., Kingston, Ontario, Canada) **Applied training programmes of psychology in Canada: A survey.** *Canadian Psychologist*, 1971(Jan), Vol. 12(1), 46-65.—Reports a survey of professional applied training programs in Canadian universities including 17 in clinical psychology, 4 each in counselling and school psychology, 1 each in educational psychology and learning disabilities, and 2 in experimental psychopathology. The number of places in the universities was related to the expected manpower requirements. Information was also given concerning the numbers of teachers in each program, the types of applied settings utilized, and the different courses offered. (French summary)—*Journal abstract*.

12. Fisch, Rudolf; Orlik, Peter, & Saterdag, Hermann. (U. Düsseldorf, Inst. of Psychology, W. Germany) **Warum studiert man Psychologie?** [Why do people study psychology?] *Psychologische Rundschau*, 1970(Oct), Vol. 21(4), 239-256.—94 freshmen, 23 graduate students in psychology, and 12 faculty psychologists indicated on questionnaires which books had influenced their decision to study psychology and their satisfaction with this decision. Most Ss listed interest in humans as the decisive factor for going into psychology. With the exception of the faculty members all other groups mentioned Freud as the author who had influenced them most. The survey detected an information gap between the actual activities of a psychologist and the expectations of beginning students.—W. J. Koppitz.

13. Johnson, Ronald W. (St. Francis Xavier U., Antigonish, Nova Scotia, Canada) **A student looks at graduate training.** *Canadian Psychologist*, 1971(Jan), Vol. 12(1), 37-41.—Discusses 2 problems which face many of the 2000 Canadian graduate students in psychology. As the academic job market continues to provide relatively fewer openings for the increasing number of new PhDs, the new graduate is faced with seeking employment in areas for which he has no training. The idealistic graduate student who wishes to engage in "relevant" research is forced by the type of graduate training he is receiving to do conservative research and to become more like his teachers in attitudes and values. The question is raised as to whether or not tomorrow's psychologists should be identical to today's psychologists. Suggestions for changes are offered for consideration by the planners of graduate programs. (French summary)—*Journal abstract*.

14. Schaub, Ronald E. (U. Calgary, Alberta, Canada) **Reafferentation in psychology.** *Canadian Psychologist*, 1971(Jan), Vol. 12(1), 42-45.—Discusses a survey among students who have recently graduated in psychology which suggested the need for feedback in the development of departmental policy. 88 Ss were sent a questionnaire and 36 responded. Results indicate that "this kind of feedback is essential for a department to evolve in relationship with both the academic community and the community at large." (French summary)—*Journal abstract*.

PROFESSIONAL DEVELOPMENTS

15. ———. **Transcript of the protestors' ses-**

sion. In F. F. Kortan, S. W. Cook, & J. I. Lacey (Eds.), "Psychology and the problems of society." (See PA, Vol. 46:Issue 1) 366-376.

16. Arthur, Artur Z. (Queen's U., Kingston, Ontario, Canada) **Psychology as engineering and technology of behaviour.** *Canadian Psychologist*, 1971(Jan), Vol. 12(1), 30-36.—Asserts that a scientific type of applied psychology has failed to develop within the profession of psychology. Reasons for the failure seem to lie in the historically continuous opposition of the educated academicians to the practical and applied science. Understanding and theory construction is placed above useful action. The establishment of schools of applied psychology could solve many problems of the development of engineering and technology of behavior. They would permit the unification of psychological expertise, the development of psychological applied services to the community within the academic framework of training and research, and they would provide opportunity for training psychologists in personal responsibility, to replace the present reliance on the medical and educational professions. (French summary)—*Journal abstract*.

17. Blau, Theodore H. (U. South Florida) **The APA Commission on Accelerating Black Participation in Psychology (CABPP).** *Counseling Psychologist*, 1970, Vol. 2(2), 77-78.—A call is issued for CABPP to join with the Black Students Psychological Association (BSPA) in becoming involved with an initial 3-yr project that began in July 1970. One's involvement could include: (a) committing self or one's group to financial support; (b) inviting BSPA and the Association of Black Psychologists to engage in dialogue or address one's group; (c) accelerating the pace of acceptance of black students and professionals within one's institution; (d) making personal associations with black Americans; (e) avoiding fitting "blacks into the white experience"; (f) influencing researchers to study the source of problems; and (g) expanding the awareness of one's own limitations.—W. S. Sahakian.

18. Carter, Launor F. **Psychologists and federal legislation.** In F. F. Kortan, S. W. Cook, & J. I. Lacey (Eds.), "Psychology and the problems of society." (See PA, Vol. 46:Issue 1) 22-23.

19. Fraser, Donald M. (U.S. House of Representatives, Washington, D.C.) **Congress and the psychologist.** In F. F. Kortan, S. W. Cook, & J. I. Lacey (Eds.), "Psychology and the problems of society." (See PA, Vol. 46:Issue 1) 25-31.

20. Guernsey, Bernard G., Stollak, Gary E., & Guernsey, Louise. (Pennsylvania State U.) **A format for a new mode of psychological practice: Or how to escape a zombie.** *Counseling Psychologist*, 1970, Vol. 2(2), 97-104.—Broad scale application of the educational model ("Edu Mod") is sought, including its displacement of the medical and clinical model, identified as the "zombie" or "Med Mod." Its advantages include wider offering of services where professional manpower is limited, greater reliability and superiority of educationally oriented tests, reevaluation and clarification of the role played by value judgments in psychological services, wider public acceptance, greater utilization of services, greater framework for problem prevention, broader base for personality theory development, broader population base research in personality, attitude, and behavior modification, plus more meaningful cooperation among academicians, researchers, and practitioners. It is hoped that the recommendations will lead toward an alternative model

for professionals, and away from the "service-delivery-system of the practicing physician." (16 ref.)—*W. S. Sahakian.*

21. Kondrasuk, John N. (U. Minnesota) **Graduate students' rankings of prestige among occupations in psychology.** *Journal of Counseling Psychology*, 1971(Mar), Vol. 18(2), 142-146.—To ascertain occupational prestige hierarchies, 269 psychology graduate students ranked 20 occupations in psychology. The prestige rankings of the total sample and 12 subgroups were analyzed. Results show that (a) the total sample rankings exhibited an occupational prestige hierarchy similar to previous studies, except that service and academic positions were upgraded while research job titles were downgraded; (b) interindividual variability was greater than hypothesized; and (c) subgroups tended to upgrade occupations related to their area of specialization. Possible causes for differences between this and prior studies are discussed.—*Journal abstract.*

23. Nelson, Thomas M. & Poley, Wayne. (U. Alberta, Edmonton, Canada) **Publication habits of psychologists in Canadian universities.** *Canadian Psychologist*, 1971(Jan), Vol. 12(1), 68-76.—Presents a survey of publication habits of psychologists. Histograms of publication frequency were prepared for biology, chemistry, history, mathematics, political science, psychology, physics, and sociology. Psychologists were most like sociologists both in the mean number of publications/individual and in the form the distribution assumed. Other clusters also appeared. Assistant, associate, and full professors holding staff appointments in Canadian universities did not appear to differ by rank in frequency of publication. Higher academic ranks did appear to be more varied in their publication habits, however. Psychologists are much less prone to multiple authorship of papers than physicists and this must be considered when publication records are evaluated. There has been a general increase in the average frequency of publication since 1961 which has resulted in a doubling of publication frequency and the present national average of .9 papers/staff member/yr. (French summary)—*Journal abstract.*

24. Thomas, Ernestine. **Recommendations for Division 17 from the Black Students Psychological Association.** *Counseling Psychologist*, 1970, Vol. 2(2), 79.—These recommendations call for the recruitment and retention of black students in counseling psychology programs by financial commitment on the part of universities until degree requirements have been completed by such students. Also sought are programs planned by black students at state association meetings, thus establishing closer and more personal contacts plus a working relationship. Moreover, state associations should provide for black student representation on boards and committees, with *Counseling Psychologist* being the vehicle for the publication of pertinent programs and articles.—*W. S. Sahakian.*

INTERNATIONAL PSYCHOLOGY

25. Myers, C. Roger, et al. (U. Toronto, Ontario, Canada) **Open forum: Research funding for psychologists in Canada.** *Canadian Psychologist*,

1971(Jan), Vol. 12(1), 3-24.—Presents an edited transcript of discussions of problems in the area of research funding for psychologists in Canada at an open forum by a panel of 5 psychologists who have been directly involved in recent developments, by the Secretary of the Science Council of Canada, by several psychologists associated with the major granting agencies, and by a number of those attending the forum. (French summary)—*Journal summary.*

26. Wright, Mary J. (U. Western Ontario, London, Canada) **Number of psychologists in Canada: 1970 estimate.** *Canadian Psychologist*, 1971(Jan), Vol. 12(1), 66-67.—A survey of registered psychologists, members of psychological associations, and faculties or departments of psychology showed that there are now at least 3400 psychologists in Canada. This is more than double the number reported in 1966. It was also found that the number of psychologists in academic settings in Canada has more than tripled in this 4-yr period. (French summary)—*Journal abstract.*

METHODOLOGY & RESEARCH TECHNOLOGY

27. Gerben, Martin J., Jones, Leeroy G., & Smoake, James A. (U. S. Army Research Inst. of Environmental Medicines, Natick, Mass.) **Behavioral tolerance of squirrel monkeys to hypoxia: A model for evaluating drug therapy.** *Behavior Research Methods & Instrumentation*, 1971(Jan), Vol. 3(1), 10-12.—Developed a behavioral tolerance-time procedure for measuring hypoxia-induced disruption of avoidance behavior using 5 adult male squirrel monkeys (*Saimiri sciureus*) under a Sidman avoidance contingency. Hypoxic atmospheres were acutely and repeatedly presented to highly trained Ss during avoidance sessions with 5 min. of normoxia between presentations of hypoxia. Behavioral tolerance time was defined as the period from the initiation of hypoxia to the occurrence of the 1st shock during each hypoxic presentation. Parametric studies demonstrate that reliable behavioral tolerance times could be obtained using a 5-sec response-shock interval and a 7% O₂ atmosphere. Acetazolamide, a drug previously shown to be beneficial for several types of functioning under hypoxic conditions, markedly lengthened behavioral tolerance time, suggesting a valid model for evaluating drug therapies.—*Journal abstract.*

Germany) **Das Wegenetz des Menschen: Ein methodischer Beitrag.** [The human network of ways: A methodical contribution.] *Psychologische Beiträge*, 1970, Vol. 12(3), 459-478.—Uses the basic ethological categories of mammals in their network of ways for human ecology and psychology. A method for detecting a human network of ways is presented, and examined for its applicability. The method by which 50 Ss were tested was based on introspection and registration. (32 ref.)—*English summary.*

MODELS & MATHEMATICAL MODELS

32. **Abbe, Elizabeth N.** **Experimental comparison of Monte-Carlo sampling techniques to evaluate the multivariate normal integral.** *U. S. Army BESRL Technical Research Note*, 1969(Jun), No. 208, 30 p.—Evaluated 2 different numerical methods for estimating probability when a multivariate normal model (e.g., one involving scores on a battery of tests) can be assumed. In a series of simulation experiments in which random vector observations were generated, probability estimates were computed by each of the 2 methods. Precision of the 2 methods was compared from the magnitude of the variances of the probability estimates over independent samples. Results indicate that when the probability region is very small, the more complex of the 2 methods (importance sampling) is superior; the simpler Monte-Carlo procedure is favored when sampling approximation is poor.—*A. J. Drucker.*

34. **Rich, Robert.** (Monash U., Clayton, Victoria, Australia) **Constant ratio rule for confusion matrices from short-term memory experiments.** *British Journal of Psychology*, 1971(Feb), Vol. 62(1), 27-35.—Presents evidence that the constant ratio rule, i.e., the subset of a large confusion matrix may be used to predict a smaller confusion matrix based on data gathered under identical conditions, also holds for confusion matrices derived from short-term memory experiments. The 10×10 confusion matrix presented by R. Conrad (see PA, Vol. 39:706) is predicted from the appropriate submatrix of $2 \times 20 \times 20$ matrices, with moderate success. Besides confirming the applicability of the constant ratio rule to short-term memory data, the experiment also provides indirect support for R. Conrad's contention that order errors are a consequence of confusions.—*Journal abstract.*

MATHEMATICS & STATISTICS

35. **Campos, Leonel.** (U. Manila, Philippines) **A note on the significance of r_{pb} .** *Philippine Journal of Psychology*, 1969(Dec), Vol. 2(2), 19-22.—Suggests that the point-biserial coefficient of correlation, r_{pb} , is the square root of the ratio of the "between" sum of squares to the "total" sum of squares, of the 1-factor, completely randomized analysis of variance design, and that an extrapolation of this design is distributed as student's t with degrees of freedom, $df = N-2$, and is therefore an appropriate test of significance for r_{pb} .—*Journal abstract.*

36. **De Finetti, Bruno.** (U. Rome, Italy) **Logical foundations and measurement of subjective probability.** *Acta Psychologica, Amsterdam*, 1970(Dec), Vol. 34(2-3), 129-145.—Discusses subjective probability, as the only meaningful interpretation of the word "probability." It is shown that degrees of belief can be translated into prices which one is willing to pay for being allowed to bet on the outcome of an uncertain event. Several measuring devices for an operational definition of subjective probability are considered. It is argued that the rules of consistency form sufficient conditions for the existence of formally admissible subjective probabilities, although other, logical or empirical, reasons may induce to further restrictions. The usefulness of probabilistic thinking and behavior is emphasized and several recommendations are made for the further development of this area, including use of scoring rules and the evaluation of probability assessors. Whether subjective probabilities reflect true characteristics of the environment is discussed, and recourse to a concept of objective probability is rejected.—*Journal abstract.*

37. **Marsh, R. W.** (Victoria U., Wellington, New Zealand) **The limitations of the Tchebychev multiplier in ascertaining the true score range.** *Australian Journal of Psychology*, 1970(Dec), Vol. 22(3), 249-251.—Illustrates some uses of the standard error technique in clinical practice for ascertaining the range of true scores from the obtained score on the WISC. The superiority of this method to the use of the Tchebychev multiplier is demonstrated.—*Journal abstract.*

38. **Murphy, Allan H. & Winkler, Robert L.** (U. Michigan) **Scoring rules in probability assessment and evaluation.** *Acta Psychologica, Amsterdam*, 1970(Dec), Vol. 34(2-3), 273-286.—Discusses some questions and problems related to the use of scoring rules (SRs) both in connection with the actual assessment of probabilities and with the evaluation of probability forecasts and probability assessors. Under linear utility, important problems of concern in assessment are the sensitivity of SRs to deviations from optimality and the effect of psychological considerations arising from the use of different SRs. Under nonlinear utility, SRs should be modified to allow for the nonlinearity in such a manner that for a specific utility function, the modified SRs are strictly proper. In evaluation from an inferential viewpoint, attributes, e.g., validity may be of interest, and in certain circumstances these attributes may be related to SRs. From a decision-theoretic viewpoint, SRs may be related to a decision maker's utilities or expected utilities if the decision maker uses the assessed probabilities in an actual decision situation. (20 ref.)—*Journal abstract.*

39. **Stael von Holstein, Carl A.** (Economic Research Inst., Stockholm, Sweden) **Measurement of subjective**

probability. *Acta Psychologica, Amsterdam*, 1970(Dec), Vol. 34(2-3), 146-159.—Proposes the use of a scoring rule (a function of the assessed probabilities and the event which actually occurs) as an incentive to honest assessment of subjective probabilities. The various properties that scoring rules should possess in order to encourage honesty are discussed. Examples of scoring rules are given together with some practical and experimental experience with scoring rules. A survey of assessment techniques which do not rely on scoring rules is included. Germany) **Ein Test nach Le Roy zum Vergleich von zwei Kontingenztafeln und seine Anwendung in der klinischen Psychologie**. [Le Roy's test for comparing two contingency tables and its application in clinical psychology.] *Psychologische Beiträge*, 1970, Vol. 12(3), 401-414.—A chi-square omnibus test suggested by H. L. LeRoy for comparing 2 $k \times m$ contingency tables as to differences in the frequencies of corresponding cells. If the null hypothesis, that both tables are samples of identical $k \times m$ classified populations, must be rejected, the sources of heterogeneity may be examined differentially by methods discussed for usefulness and adequacy. The test and the latter methods are illustrated by an example from clinical psychology. LeRoy's test and its generalization are compared with tests examining interaction between 2 contingency tables. Both types of tests are relevant for research in clinical psychology. (18 ref.)—*English summary*.

Factor Analysis

42. Holley, Jasper W. & Harris, Chester W. (U. Lund, Psychological Lab., Sweden) **The application of the Harris bridge in the generalization of the Burt reciprocity principle: A demonstration study**. *Scandinavian Journal of Psychology*, 1970, Vol. 11(4), 255-260.—The reciprocity principle, formulated by C. Burt, has related the Q and R factor systems when double-centered score matrices are used. Subsequently, Burt's bridge was 1st generalized by J. Sandler for single-centered matrices, but was applicable only under restricted conditions. A final generalization is described as a transition based on correlations rather than G indices, which provides for the conversion of rotated Q factors to equivalent R factors. An illustrative example is given, using hypothetical data.—*Journal abstract*.

COMPUTERS & PROGRAMING

44. Ainsworth, W. A. & Millar, J. B. (U. Keele, England) **A simple time-sharing system for speech perception experiments**. *Behavior Research Methods & Instrumentation*, 1971(Jan), Vol. 3(1), 21-24.—Describes a system which enables a background program to be run

in 1 field while another program in the other field controls an experiment. "Programming has been simplified by the use of modules, and the effective time available on the machine has been increased by the introduction of a simple form of time sharing." Although the system is described as a program for controlling speech perception experiments, it may also be readily applied "to other psychophysical experiments, to the processing of physiological data on-line, and probably to many other situations where the machinery to be controlled operates at human rather than computer speeds."—S. Knapp.

45. Baudot, Jean. **Informatique et Information**. [Information handling and information] *Interprétation*, 1968(Oct), Vol. 2(4), 47-58.—Examines the accomplishments of computers in their application to solving scientific problems; describes the machines themselves as well as programing procedures; and defines "information" within the context of data processing, finally considering computer handling of linguistic data. Subsequent discussion concerns the possibility of information handling being considered a "model," enabling the formulation in terms of communication complex phenomena relating to the behavioral sciences, and the application, if not transposition, of information concepts to the sphere of human communication, including the psychoanalytic situation.—T. N. Webster.

46. Blisellius, Per A. (AB ASEA-ATOM, Box 53, Vasteras, Sweden) **A PDP-9 computer program for on-line calculation of mean values, variances, and amplitude distribution**. *Behavior Research Methods & Instrumentation*, 1971(Jan), Vol. 3(1), 37-43.

47. Cavanaugh, C. R. & Ruback, Eugene P. (U. Maryland) **A semiautomatic system for preparing computer data cards**. *Behavior Research Methods & Instrumentation*, 1971(Jan), Vol. 3(1), 46-47.—Describes a system which eliminates manual coding and punching of computer data cards in a psychophysical experiment. Conventional relay logic is used to control the operation of a card punch and to enter data in selected card columns.—*Journal abstract*.

48. Cumming, Geoff. (Inst. of Experimental Psychology, Oxford, England) **LINC-8 presents and controls visual experiments**. *Behavior Research Methods & Instrumentation*, 1970(Jan), Vol. 3(1), 24-29.—Describes TSCOPE, a set of programs for use with a basic LINC-8, which "is suited to the well-controlled display of small amounts of material. Long sequences of presentations can be set up with the S sitting at the CRT initiating each trial with a footswitch, or runs of trials may be presented and the S's responses and reaction times recorded. TSCOPE should be a useful tool for work in the areas of visual perception of letters and digits which are masked or presented at fast rates, memory span and short-term memory for visually presented characters, and information handling with visual input."—S. Knapp.

49. Gardner, R. C. (Philippine Normal Coll., Language Study Center, Manila) **Psychology and the computer in the Philippines**. *Philippine Journal of Psychology*, 1969(Dec), Vol. 2(2), 43-56.—Briefly summarizes a series of computer programs which are available to psychologists and other researchers in the Philippines, and which do not require a knowledge of computer programing or technology. A group of 12 programs is presented with a description of each program, the information required by the computer to

perform the analysis, and the way in which the data must be prepared. The programs are considered to be aids in preparing statistical information.—P. R. Shibelski.

50. Michaux, J. & Bergmans, J. (U. Louvain, Electronics Research Lab., Belgium) **A program for simultaneous stimulation and data handling in neurophysiological research.** *Behavior Research Methods & Instrumentation*, 1971(Jan), Vol. 3(1), 33-36.—Describes the programed pulse generator (PPG) "which controls entirely the sequences of stimuli given to a preparation during a whole experiment, and at the same time executes analysis routines on the events occurring in response to the stimuli." Originally developed "to provide the experimenter with stimulus sequences which cannot be realized even with complex batteries of stimulators... the great power of the PPG has proven to be fruitful, particularly in suggesting experimental approaches which are not considered with conventional stimulators. Even for simpler experiments, PPG, by reducing the amount of manual operations shortens the duration of the experiment, and increases the viability of the stimulation series."—S. Knapp.

Germany) **Die psychologische Interpretation nichteuklidischer in der multidimensionalen Skalierung.** [The psychological interpretation of non-Euclid metrics in the multidimensional scale.] *Dissertation Abstracts International*, 1970(Nov), Vol. 31(5-B), 2972.

Construction & Validation

55. Hutchins, Charles W. (Ohio State U.) **A new approach to the construction of a prediction battery.** *Dissertation Abstracts International*, 1970(Oct), Vol. 31(4-B), 2340.

56. Waters, Carrie W. **Comparison of computer-simulated conventional and branching tests.** *U. S. Army BESRL Technical Research Note*, 1970(Mar), No.

216, 38 p.—Reports on a comparison of computer-simulated branching and conventional tests which varied in length, distribution of item difficulty, and item validity. Comparison was in terms of correlation between underlying ability and test scores (Lord's model). Principal finding was that in tests with higher item validities ($r_{bis} = .60$ to $.90$), a branching test had higher correlation with underlying ability than did any of the conventional tests, for all 3 lengths studied. Finding supports an earlier exploratory study and provides useful guidelines for further research with branching tests.—A. J. Drucker.

EXPERIMENTATION & OBSERVATION

57. Ballus, C. (U. Barcelona, Hosp. Clinic, Spain) **El factor tiempo en los tests psicofisiológicos.** [The time factor in psychophysiological tests.] *Anuario de Psicología*, 1969, Vol. 1, 5-13.—Discusses the time factor in relation to the time limitation of stimulus exposure. The validity of such a time factor on various psychophysiological tests is considered to be dependent upon CNS fluctuations within individuals. It is noted that a wide range exists in which CNS fluctuations could be considered normal. It is concluded that the technique of limiting the time of stimulus exposure has the greatest possibility for wide practical application in the perception-apperception sphere, and most concretely with tachistoscopic projection. (18 ref.)—P. Hertzberg.

58. Felton, Gary S. (U. Southern California) **Experimenter expectancy effect examined as a function of task ambiguity and internal versus external control of reinforcement.** *Dissertation Abstracts International*, 1970(Oct), Vol. 31(4-B), 2277-2278.

59. Reid, John B. (U. Wisconsin) **Reliability assessment of observation data: A possible methodological problem.** *Child Development*, 1970(Dec), Vol. 41(4), 1143-1150.—Conducted an experiment to determine the accuracy of 7 female undergraduate Os under 2 conditions: overt reliability assessment, during which O knew her accuracy was being checked; and covert reliability assessment, during which she thought that her accuracy could not be checked. A marked drop in accuracy was observed for all Os from overt assessment conditions. Questions are raised concerning the veridicality of observation data which are not continuously monitored.—*Journal abstract*.

APPARATUS

61. Rogers, Peter L., Scherer, Klaus R., & Rosenthal, Robert. (Harvard U.) **Content filtering human speech: A simple electronic system.** *Behavior Research Methods & Instrumentation*, 1971(Jan), Vol. 3(1), 16-18.—Discusses the use of electronic bandpass filtering for content-masking speech samples in studies on expressive aspects of vocal behavior. A simple electronic filtering system, which can be built easily and which can be adopted readily for a variety of applications, is described. (16 ref.)—*Journal abstract*.

62. Stoller, D. F., Kinney, J. P., Burson, R. C., & McNew, J. J. (U. California, Brain Research Inst., Los Angeles) **Apparatus for collection of individual micturition samples from unrestrained primates.** *Physiology & Behavior*, 1971(Jan), Vol. 6(1), 91-93.

—Describes an apparatus which consists of 3 major parts: a sensing head through which urine is detected by a photodiode; a control box which contains the power supply and circuitry; and a motor driven turntable which contains 12 large sample bottles. The detection of urine flow activates the logic in the control box. Following termination of the urine flow, a new sample bottle is automatically moved into position for the next sample collection.—*Journal abstract.*

EXPERIMENTAL PSYCHOLOGY

63. Rule, Stanley J. & Markley, Robert P. (U. Alberta, Edmonton, Canada) **Subject differences in cross-modality matching.** *Perception & Psychophysics*, 1971(Jan), Vol. 9(1-B), 115-117.—48 right-handed male undergraduates performed 4 tasks each: (a) magnitude estimation of area, (b) magnitude estimation of numerosness, (c) cross-modality matching of force of handgrip to area, and (d) cross-modality matching of force of handgrip to numerosness. An additional 48 Ss performed Tasks b and d. Psychophysical power functions were fitted to the data of each S for each condition. Higher correlations between individual exponents were found for conditions employing a common response (i.e., estimating or squeezing) than were found for conditions with the same set of stimuli. Individual differences among exponents stem more from the idiosyncratic use of the dependent variable than from different sensory characteristics.—*Journal abstract.*

64. Wagenaar, W. A. (Inst. for Perception, Soesterberg, Netherlands) **Appreciation of conditional probabilities in binary sequences.** *Acta Psychologica, Amsterdam*, 1970(Dec), Vol. 34(2-3), 348-356.—Investigated the question of whether or not Ss are able to select a random binary sequence out of a set of nonrandom ones. 93 undergraduates and 110 officer-candidates judged binary sequences of white and black dots with respect to randomness. The conditional probability of white following white (black following black) was varied from .2-.8 with steps of .1. At the same time the order of dependency was varied among 1, 2, and 3. Results show that sequences with conditional probabilities around .4 were judged as most random. The standard deviation of successive judgments increased with the order of dependency. Data suggest that Ss did not process conditional probabilities or informational contents, but rather the run-structure of the binary sequences. It is concluded that the effect of subjective randomness is mainly to be attributed to a bias against runs of 6 or more elements.—*Journal abstract.*

PERCEPTION

65. Derrick, Ellen & Dewar, Robert. (U. Calgary, Alberta, Canada) **Visual-tactual dominance relationship as a function of accuracy of tactual judgment.** *Perceptual & Motor Skills*, 1970(Dec), Vol. 31(3), 935-939.—Investigated the question of dominance of either the visual or tactual modalities when information to the 2 is simultaneous and disparate but not conflicting. 36 undergraduates viewed 1 object while exploring another of different size using active touch, and then matched the seen and felt objects from an array of 10 such objects. Across the 3 conditions of tactual accuracy that were

used, the average visual match was in the direction of the tactual object's correct match and the average tactual match was in the direction of the visual object's correct match. An average tactual error significantly larger than the average visual error indicated a residual dominance of vision over touch. A further hypothesis, that as degree of tactual accuracy decreases the amount of visual dominance increases, was not confirmed.—*Journal abstract.*

66. Geller, E. Scott. (Virginia Polytechnic Inst.) **The effect of expected difficulty on psychophysical judgment.** *Psychonomic Science*, 1970(Sep), Vol. 20(6), 325-326.—Prior to estimating the midpoints of various line lengths, 1 experimental group was told that the judgment task was difficult and to expect large errors, while another group was instructed that the task was easy and to expect few judgment errors. Ss were 34 undergraduates. The average deviations of midpoint judgments from the measured midpoint of various line lengths was reliably larger for the group instructed to expect large deviations.—*Journal abstract.*

67. Goldner, Jeffrey; Reuder, Mary E., Riba, Benjamin, & Jarmon, David. (Lamont Geological Observatory, Palisades, N.Y.) **Neutral vs ego-orienting instructions: Effects on judgments of magnitude estimation.** *Perception & Psychophysics*, 1971(Jan), Vol. 9(1-B), 84-88.—Performed 3 experiments to examine the relative constancy of the exponent in the psychophysical power law under varying motivating conditions. Ss were 20 high school boys, 24 undergraduates, and 40 evening school students, respectively. The method of magnitude estimation was used to obtain judgments of apparent tactual roughness or of apparent area size of squares. Patterns of the qualitative observations of the 3 Es and of the various exponents for the 6 groups of Ss indicate that neutral instructions and "ego-orienting" instructions, which were perceived as unbelievable coming from an equal fellow student, both yielded exponents identical to those reported in the literature. Believable ego-orienting instructions given by an E of clearly perceived higher social status produced a statistically significantly lower exponent than neutral. Intermediate conditions, wherein Ss apparently disbelieved both types of instructions, but assumed that the superior-status E was "analyzing" them, yielded exponents of intermediate size. Results and supplementary trend analyses are discussed as possible, highly sensitive indicators of motivational impacts on sensory judgments. (19 ref.)—*Journal abstract.*

68. Harshfield, Stephen P. & DeHardt, Doris C. (California State Coll., Long Beach) **Weight judgment as a function of apparent density of objects.** *Psychonomic Science*, 1970(Sep), Vol. 20(6), 365-366.—5 cubes of equal size and weight made of balsa wood, mahogany, aluminum, brass, and steel were ranked from heaviest to lightest in the above order by 30 undergraduates who lifted each of these cubes, while 30 undergraduates who ranked the cubes visually reported the reverse order, as their apparent density would prescribe. Phenomenologically the present results, which might be called a density-weight illusion, are quite similar to those of the size-weight illusion.—*Journal abstract.*

69. Jennings, Luther B. & George, Stephen G. (Occidental Coll.) **The Spence-Holland theory of subliminal perception: A reexamination.** *Psychological Record*, 1970(Fal), Vol. 20(4), 495-504.—2 experiments,

with 149 and 46 undergraduates, respectively, replicated the D. P. Spence and B. Holland study (see PA, Vol. 38:1679) which yielded positive support for a psychoanalytic theory of subliminal perception. In Exp. I, groups were exposed to stimuli whose quality ranged from slightly above to well below the forced-choice detection threshold. In Exp. II, groups were exposed to stimuli whose quality was at 3 different levels below the forced-choice detection threshold. Only 1 of the 10 experimental groups gave support to the Spence and Holland theory that subliminal stimuli affect retention of words by communicating with unconscious associations on the basis of meaning. An attempt to replicate this finding with a 2nd group proved unsuccessful. Although some support may have been obtained for the contention that stimuli which are slightly above the forced-choice detection threshold affect retention of words on the basis of structural similarities between stimulus and words, the findings as a whole do not support the Spence and Holland psychoanalytic theory of unconscious perception.—*Journal abstract.*

70. Moed, H. K. (U. Amsterdam, Lab. of Psychology, Netherlands) **Constancy and contrast: Ille.** *Acta Psychologica, Amsterdam*, 1970(Dec), Vol. 34(4), 525-645.—Describes a mathematical design of the model of perception. "The barrier between the objective and the subjective can be transcended by means of the ideal concept of number, but then any sign attached to the values should be regarded as a correlation sign only. From this point of view the fundamental difference between the mathematical and the perceptual complex planes, as well as their conformity could then be pointed out, the latter being determined by an absolute point transcending both mathematics and perception." (48 ref.).—S. Knapp.

71. Moore, Maxine R. (Brown U.) **The perceptual-motor domain and a proposed taxonomy of perception.** *AV Communication Review*, 1970(Win), Vol. 18(4), 379-413.—Describes a perceptual-motor domain characterized by sensory-dependent activity performed in the presence of the stimulus. Perception is defined as a process of extracting information from the stimulus; the focus of the discussion is on the perceptual, or input, end of behavior. A taxonomy of perceptual behaviors is proposed in which the elements are ordered on the principal of increasing information extraction. The major categories of the proposed taxonomy are derived from the factor-analytically based sensory dimension of the Guilford "structure of intellect." 2 assumptions underlie the proposed taxonomy: (a) many apparently diverse behaviors can be understood in terms of a single perceptual process, and (b) a hierarchy of information extraction is inherent in the nature of this process.—*Journal summary.*

72. Müller, Gisela. (Free U., Inst. of Psychology, Berlin, W. Germany) **Differential-psychologische Untersuchungen zum Vigilanzverhalten.** [Experiments in individual differences of vigilance behavior.] *Psychologische Forschung*, 1970, Vol. 34(1), 10-47.—In a simple and a complex vigilance task there was a negative correlation between the probabilities of signal detections and false alarms rates. With regard to the temporal characteristics of vigilance behavior it was found that Ss with the least decrease of detection rate showed the greatest reduction of their false alarms rate to the beginning of the vigilance task. Results are discussed in the context of the detection model.—*English summary.*

73. Payne, M. Carr. (Georgia Inst. of Technology)

Effects of altering stimulus components upon response latency. *Perceptual & Motor Skills*, 1970(Dec), Vol. 31(3), 924-926.—Reports 2 experiments with 50 and 48 male undergraduates. In Phase 1, 0 responded by pressing the appropriate key when a light and a sound appeared at the same place and another key when they did not. In Phase 2, relations between location of the light and sound were altered. Phase 3 was identical to Phase 1. Time between presenting a signal and pressing the appropriate key (latency) was measured. Differences in latencies between Phases 1 and 2 were significantly less when both sound and light appeared on the opposite side from the corresponding position of Phase 1 than when only the sound or the light was altered in position.—*Journal abstract.*

75. Yelen, Donald R. (Washburn U.) **The effects of dissonance and reward on perceptual distortion.** *Psychonomic Science*, 1970(Sep), Vol. 20(6), 319-321.—Aroused dissonance by persuading 39 undergraduates to make inconsistent psychophysical judgments. The inconsistent judgments were rewarded in 1 group and not rewarded in another group. Comparisons with a control group suggest that Ss in both the rewarded and nonrewarded groups reduced dissonance by distorting their perception of the psychophysical stimuli during postdissonance trials.—*Journal abstract.*

76. Zelkind, Irving & Bachhuber, Mary. (Loretto Heights Coll.) **Geometric correlates of temporal durations: Signs of the times.** *Perceptual & Motor Skills*, 1970(Dec), Vol. 31(3), 971-974.—Hypothesized that periods of time of increasing duration are associated with geometric figures of increasing dimensionality and complexity. Each of 60 female undergraduates chose geometric figures of 1, 2, or 3 dimensions as best representing temporal durations (second, hour, day, year, century, or forever). Assignment of figures to time periods was significantly nonrandom ($\chi^2 < .01$) for 5 of the 6 intervals. Agreement among the judges was significant ($p < .05$), and a generally monotonic, positive relationship, based on ordinal measurement of the variables, was indicated (Spearman rho = .808). Underlying factors of linear extension or complexity are suggested as the means of mediation between the variables.—*Journal abstract.*

Illusion

77. Lester, Gene & Morant, Ricardo B. (Wheaton Coll.) **Apparent sound displacement during vestibular stimulation.** *American Journal of Psychology*, 1970(Dec), Vol. 83(4), 554-566.—Vestibular stimulation by means of angular acceleration around the midbody vertical axis produces a shift in the apparent position of a sound objectively rotating with the S—the audiogyril illusion. 2 possible explanations of the illusion were tested by a new method that leads to considerably reduced variance compared with previous methods. 4 undergraduates trained in auditory localization were Ss. There were no significant differences in the extent of the illusion when stimulus tones of 500~, 1024~, and 5000~ were used. The illusion was significantly diminished in extent when the Ss strained their immobilized heads in the direction opposite from the usual apparent

sound displacement during rotation. It is concluded that the illusion is based on a change in the felt position of the head rather than on differential hearing changes.—*Journal abstract.*

78. Massaro, Dominic W. & Anderson, Norman H. (U. California, San Diego) **A test of a perspective theory of geometrical illusions.** *American Journal of Psychology*, 1970(Dec), Vol. 83(4), 567-575.—Used 3-dimensional Müller-Lyer figures in 3 experiments to test a perspective theory of geometrical illusions. Ss were undergraduates (N = 16, 16, and 20, respectively). The real depth cues were in 1 of 2 orientations, designed either to support or to oppose the action of the perspective depth cues hypothesized by the perspective theory. If any illusion is obtained with these 3-dimensional figures, the theory implies, its magnitude should be different in the 2 orientations. A substantial illusion was obtained, but the difference between the 2 orientations was small and opposite to the prediction of perspective theory.—*Journal abstract.*

79. Stanley, Gordon & Jackson, Robert. (U. Melbourne, Victoria, Australia) **The apparent lengths of arcs on white and black sectors of rotating discs.** *Australian Journal of Psychology*, 1970(Dec), Vol. 22(3), 243-247.—Investigated the effect of background variables on the Ansbacher effect. In Exp. I 8 male and 8 female paid volunteers made magnitude estimates of the apparent length of white arcs located on the black $\frac{1}{2}$ of a white and black rotating disc. The apparent length was estimated of black arcs located on the white sector. Both white and black arcs lengthened as a function of increasing speed. The lengthening of the white arc is termed a negative Ansbacher effect. The apparent shrinkage of the white arcs on whole black discs (the original Ansbacher effect) was confirmed in Exp. II. The experiments demonstrate the importance of the relation between arc and surround for the appearance of shrinkage.—*Journal abstract.*

80. Warren, Richard M. (U. Wisconsin, Milwaukee) **Perceptual restoration of missing speech sounds.** *Science*, 1970(Jan), Vol. 167(3917), 392-393.—In a study of the effect of transient masking sounds, it was found that when an extraneous sound (e.g., a cough or tone) completely replaces a speech sound in a recorded sentence, listeners believe they hear the missing sound. The extraneous sound seems to occur during another portion of the sentence without interfering with the intelligibility of any phoneme. If silence replaces a speech sound, the gap is correctly localized and the absence of the speech sound detected. An experiment with 20 undergraduates exploring this phonemic effect is described.—*Journal abstract.*

Time

81. Long, Gerald & Mo, Suchoon. (U. Detroit) **Interval estimation as a function of constant and interrupted stimulation.** *Psychonomic Science*, 1970(Oct), Vol. 21(2), 87-88.—Investigated the relationship between a temporal interval's perceived length and the amount of stimulus and stimulus change within that interval. In 3 separate tests of 13 male and 12 female undergraduates, completely filled intervals were found to be significantly overestimated by the Ss in comparison with empty intervals, whereas, interrupted or divided intervals were underestimated.—*Journal abstract.*

82. Poppel, Ernest & Giedke, Henner. (Max Planck Inst. for Psychiatry, Munich, W. Germany) **Diurnal**

variation of time perception. *Psychologische Forschung*, 1970, Vol. 34(2), 182-198.—Investigated the influence of endogenous and exogenous factors on the diurnal variation of human time perception in a series of 6 experiments. In all experiments Ss produced 10-sec intervals. In Exp. I Ss lived according to their normal daily routine, sleeping at night and tested only during daytime. A significant influence of the time of day on time perception could be observed. In Exp. II Ss were awakened and tested during the night as well as during the day. The diurnal variation under this condition was more pronounced than in Exp. I. In Exp. III Ss had to stay awake during the night. Under this condition the range of variation, i.e., the difference between the daily maximum and minimum, was considerably decreased. The results of Exp. II and III were replicated in Exp. IV. In Exp. V an exogenous factor was tested as to its influence on time perception. During the 1st 4 days of the experiment the conditions of Exp. II were replicated. Then Ss had to live for 4 days in complete darkness. The removal of the light-dark cycle did not decrease the diurnal variation of time perception. In Exp. VI Ss lived for several weeks in complete isolation. Although there were no longer any external time cues, in this experiment a significant circadian variation of time perception was observed. It is concluded that the diurnal variation of time perception has an endogenous basis.—*R. Gunter.*

83. Preusser, David; Garner, W. R., & Gottwald, Richard L. (Yale U.) **The effect of starting pattern on descriptions of perceived temporal patterns.** *Psychonomic Science*, 1970(Nov), Vol. 21(4), 219-220.—28 undergraduates listened to and then described 4 continually repeating sequences of 9 tones presented at the rate of 3 tones/sec. Each tone was either 275 Hz. (high) or 250 Hz. (low). It was found that the greater the frequency of use of a pattern as a description, the more often will it be accepted as a description when started that way. If a pattern is not described as presented, then S is more apt to shift to a frequently used description than to an infrequently used 1.—*Journal abstract.*

88. Gyr, John W. & Willey, Richmond. (U. Michigan) **The effect of efferece to the arm on visual adaptation to curvature: A replication.** *Psychonomic Science*, 1970(Oct), Vol. 21(2), 89-91.—Tested the findings of L. Festinger, C. A. Burnham, H. Ono, and D. Bamber (see PA, Vol. 41:12903) using prisms of 20, 30, and 55 diopters. 48 female undergraduates inspected a curved line through a prism that made it appear straight, then moved 1 finger along the line in 1 of 2 ways: (a)

encouraged the learning of a new efferent program for a curved movement (learning), and (b) (accuracy) offered little opportunity for such learning. Replicating a finding by L. Festinger, et al., the learning condition produced slightly, but significantly, more visual adaptation to curvature than did the accuracy condition. There was some suggestion that greater prismatic strength produced greater adaptation. Results support the idea that efferent commands to the arm can affect visual perception of contour shape.—*Journal abstract.*

(U.S. Army Natick Lab., Pioneering Research Lab., Mass.) **Ambient temperature and the flicker-fusion threshold.** *Journal of Experimental Psychology*, 1971(Mar), Vol. 87(3), 314-319.—Exposed 24 unprotected 19-25 yr. old Army enlisted men for 90 min. to ambient temperatures of 40°, 80°, and 120° F with 35% relative humidity. After 1 hr. of exposure, the flicker-fusion threshold (FFT) was determined using both the method of constant stimuli and the forced-choice procedure, with stimulus conditions of 35 and 95% of light to cycle (P_L) at both 30° and 2° visual angle (VA). An increase in FFT frequency during cold exposure found for 1 stimulus condition was interpreted in terms of subjective criterion effects. Sensory sensitivity effects were inferred from the significant increases in frequency at FFT during heat exposure for the 35- P_L , 30° VA condition across the 2 psychophysical procedures. Sensory sensitivity effects of heat exposure on FFT are discussed in terms of a 2-component retinal response to brightness changes of an intermittent light at FFT.—*Journal abstract.*

93. Ravey, John. (Queen's U., Belfast, Ireland) **A study of sensory interactions.** *Papers in Psychology*, 1969(Oct), Vol. 3(2), 67-68.—Investigated the findings by V. Urbantschitsch in 1903 that, "in binocular rivalry, unilateral auditory stimulation heightens the acuity of the ipsilateral eye." Red and green stimuli were presented to 40 Ss in 4 groups receiving various presentations of auditory stimuli. Results did not support the previous finding. The possible physiological mechanisms of sensory interaction are discussed.—*S. Knapp.*

94. Rinalducci, Edward J., Higgins, Kent E., & Cramer, Joan A. (U. Virginia) **Nonequivalence of backgrounds during photopic dark adaptation.** *Journal of the Optical Society of America*, 1970(Nov), Vol. 60(11), 1518-1524.—Investigated equivalence for long-term photopic dark adaptation using 2 target diameters (.13° and .33°) and 4 chromatic combinations of red and green test and adapting stimuli (red on red, red on green, green on green, and green on red). 2 Ss had normal color vision, 1 was slightly protanomalous, and 2 were deuteranomalous. Except under special conditions employing color-defective Os for which there was more

complete isolation of cone mechanisms, equivalence between adaptive states was generally found not to exist. It is concluded that more than 1 process is needed to control the spatial integration of light in the photopic system, and these are hypothesized to be the wavelength-dependent excitatory and inhibitory processes of the visual receptive field. Kansas) **Prism adaptation: The "target-pointing effect" as a function of exposure trials.** *Perception & Psychophysics*, 1971(Jan), Vol. 9(1-B), 102-104.—Examined the amount by which target pointing enhances prism adaptation (the target-pointing effect) as a function of exposure trials. Each of 12 undergraduates in 3 conditions—target-pointing, no-target, and control—wearing 20-diopter prism goggles in the 1st 2. S was measured prior to the exposure period on target-pointing accuracy with normal vision but with no visual feedback regarding his performance. Similar measures were taken after the 5th, 10th, 15th, 25th, 35th, 55th, and 95th exposure trials and after each of 2 consecutive 5-min postexposure periods in the dark. The 2 experimental conditions led to sharply rising and negatively accelerated adaptation (negative aftereffect) curves, the asymptotes of which differed markedly, in favor of the target-pointing condition. This difference in asymptotes indicates that the target-pointing effect is not limited to the early portion of the exposure period but, instead, is a relatively permanent phenomenon. There was no decline in adaptation during the postexposure period. (17 ref.)—*Journal abstract.*

The background of the rod was a field of stripes slowly rotating in the fronto-parallel plane around S's visual axis. Ss were in different degrees of body tilt when making the adjustments. Data were interpreted using a block diagram model, which was developed in successive steps. Each premise used in the construction of the model is discussed extensively. Essentially, the model can be described by the following propositions: (a) The (approximative) direction constancy of phenomenal space under conditions of head tilt depends on an orthogonal transformation of the phenomenal space coordinates, the direction of the transformation being opposed to that of head tilt ("compensation theorem"). (b) Under the conditions of this experiment, the

compensatory rotational transformation essentially was controlled by the vestibular and visual systems. (c) The vestibular system by itself was capable of controlling rotational transformation; however, its activity was supported by visual influences, which were superimposed in an additive manner ("superposition hypothesis").—*English summary.*

101. Groman, William D. & Worsham, Robert W. (Virginia Commonwealth U., Richmond) **Some evidence for a visual slant averaging mechanism.** *Psychonomic Science*, 1970(Nov), Vol. 21(4), 221-223.—Hypothesized that when 2 surfaces at different angles of slant were presented stereoscopically, the resulting percept would be a single slanted surface seen at an angle equal to the mean slant of the stimulus objects. 15 undergraduates were tested on the Groman binocular disparator under 15 different conditions of disparity, (20° to $+20^\circ$). 10 judgments were made for each condition in a random order. The stimulus cards were $2 \times 3 \times 4$ in. white cards ruled into $1/2$ -in. squares. Each exposure was 2 sec. in duration. Following exposure E manipulated a test card until S indicated that it was at the same angle as the preceding perceived slant. Results strongly support the hypothesis. Findings are discussed in terms of a gradient theory of slant perception and a neurophysiological averaging mechanism.—*Journal abstract.*

108. Putz, Vernon & Smith, Karl U. (U. Wisconsin, Behavioral Cybernetics Lab.) **Human factors in operating systems related to delay and displacement of retinal feedback.** *Journal of Applied Psychology*, 1971(Feb), Vol. 55(1), 9-21.—Evaluated theories of response to altered retinal feedback—i.e., associative learning doctrines and the feedback-compensation hypothesis in relation to their application in defining human factors principles in machine and perceptual training designs. Using 12 Ss, controlled comparisons were made of the relative effects of reversed and delayed feedback of head and eye movements under conditions in which head movements could not compensate altered feedback of eye movements and vice versa. Findings, e.g., the accuracy of ocular tracking, etc., are discussed. Some results indicate that there was little or no learned adaptation to the reversed and delayed vision produced by head and eye movements. Findings support a behavioral cybernetic interpretation of the guidance factors in man-machine and perceptual systems relationships by showing that the effects of altered feedback in machine and systems operation are determined by movement capabilities in compensating displacements and delays in sensory input. Results also suggest that visual impairments may be produced by delays in the retinal feedback effects of eye and head movements and that these defects may require dynamic methods of optometric diagnosis and training for their measurement and correction.—*Journal abstract.*

(Veterans Administration Hosp., Brecksville, O.) **Information processing of visual figures in the digit symbol substitution task.** *Journal of Experimental Psychology*, 1971(Mar), Vol. 87(3), 335-342.—Studied the Digit Symbol subtest of the WAIS as an information-processing task using 553 undergraduates. Results indicate that (a) when the visual figures used as symbols are varied according to the size of the equivalence set from which they are selected, rate of information processing decreases as set size increases; (b) substituting a digit with a symbol results in faster rates than the opposite substitution if several members of the same equivalence set are present, but not if the members are from different sets; and (c) the balance of the distribution of the frequency of items interacts with the type of substitution. The balanced, digit symbol substitution produces fastest rates. Implications for perceptual theory are discussed. (18 ref.)—*Journal abstract.*

(Bell Telephone Lab., Murray Hill, N.J.) **Information retrieval from two rapidly consecutive stimuli: A new analysis.** *Perception & Psychophysics*, 1971(Jan), Vol. 9(1-B), 89-91.—Analyzes data from an experiment in which Ss reported letters from 2 consecutive stimuli by a nonmetric multiple regression analysis that permits the evaluation of nonlinear—e.g., quantal—hypotheses. Data contradict the hypothesis that total stimulus duration is the critical factor in response accuracy and the hypothesis of a quantal time period. They support the theory of visual persistence and continuous processing, namely, visibility of a stimulus persists for a few tenths of a sec. after a stimulus has been turned off; the effect of a 2nd stimulus exposure coming quickly after the 1st is to terminate visibility of the 1st stimulus and to substitute for it visibility of the 2nd; information is retrieved at a rapid rate from whichever stimulus is visible.—*Journal abstract*.

Helsinki, Finland) **Tendencies to eye movement, and misperception of curvature, direction, and length.** *Perception & Psychophysics*, 1971(Jan), Vol. 9(1-B), 65-72.—Infers from previous studies of eye movements that there are 3 types of eye-movement tendency: (a) rectilinear movements, (b) horizontal or vertical movements, and (c) center-of-gravity fixations. The possible influence of these tendencies on perception was investigated in 2 experiments with 20 and 22 undergraduates. In Exp. I, errors in perceived location of intersection in arc figures were studied varying arc-point distance and arc length. Tendencies a and b accounted very well for the resultant S-shaped functions. In Exp. II, the Müller-Lyer illusion with 3 different oblique angles and a line-segment illusion were measured as a function of the distance between the vertex and the center of gravity of the

arrowhead. Tendency c accounted well for the inverted-U forms of the obtained functions but not for the increase of error with increasing angle (27 ref.) *Journal abstract*.

116. Wenderoth, Peter M. (U. Sydney, New South Wales, Australia) **A visual spatial aftereffect of surface slant.** *American Journal of Psychology*, 1970(Dec), Vol. 83(4), 576-590.—In 5 experiments with 137 undergraduates, it was found that the long (binocular) inducing period required by R. Bergman and J. J. Gibson (see PA, Vol. 34:5184) to generate a measurable slant aftereffect was not necessary for a high-contrast surface. The aftereffect for the black-on-white lattice pattern dissipated exponentially. The complex surface, however, produced concomitant interfering effects, possibly decreasing the precision of aftereffect measures. A simpler surface, of vertical contours, sufficed for relatively accurate binocular (but not monocular) adjustments to the vertical. This pattern also produced interfering effects, possibly accounting for the correlation of aftereffect variance with inducing-figure slant. Studies suggest using a single vertical contour as both inducing and test figures to study a hypothesized relationship between tilt and slant aftereffect.—*Journal abstract*.

119. Dwyer, William O. & Lit, Alfred. (Memphis State U.) **Effect of luminance-matched wavelength on depth discrimination at scotopic and photopic levels of target illumination.** *Journal of the Optical Society of America*, 1970(Jan), Vol. 60(1), 127-131.—Required 2 Os to make equidistance settings in a 2-rod apparatus with illuminated white and colored targets photometrically matched at 8-9 illumination levels ranging from 0.03-30 trolands (td). The equidistance settings were analyzed in terms of the angular magnitude of both the variable error, ηAD , and the constant error, $\eta \Delta R$. The ηAD vs. retinal-illuminance curves for the white and colored targets show that at low retinal illuminances, ηAD is initially large. With increasing target illumination, ηAD progressively decreases to approach a final low asymptotic value. Each experimental curve shows a discontinuity at about 1 td. The curves representing the different wavelengths essentially overlap throughout the entire luminance range, indicating that, at both scotopic and photopic levels, wavelength has no differential effect on the variability of equidistance settings. Although the corresponding data for the angular constant error, $\eta \Delta R$, are considerably less regular, no differential wavelength effects are evident. The absolute magnitude of the constant errors generally decreases for all wavelengths as target illumination is increased. Data are discussed in terms of the duplicity theory of vision, emphasizing the effect of brightness matches performed at subphotopic (i.e., at scotopic and mesopic) levels. *Journal abstract*.

120. Franklin, Samuel S., Ross, Helen E., & Weltman, Gershon. (Fresno State Coll.) **Size-distance invariance in perceptual adaptation.** *Psychonomic Science*,

1970(Nov), Vol. 21(4), 229-231.—Objects viewed through a facemask under water appear larger and closer than when viewed in air. Adaptation to this distortion was measured in 11 experienced scuba divers and 15 undergraduate controls by obtaining estimates of the size and distance of an array of targets before and after a 20-min underwater dive. A negative correlation between size- and distance-adaptation scores indicates that most divers adapted to 1 dimension by counteradapting to the other. Some Ss adapted to size by increasing the distortion of apparent distance and some did the reverse. Results are discussed in relation to the size-distance invariance hypothesis.—*Journal abstract.*

121. **Fulgosi, Ante & Fulgosi, Ljerka.** (Philosophical Faculty, Zagreb, Yugoslavia) **The boundaries of entoptic space and Emmert's law.** *Acta Psychologica, Amsterdam*, 1970(Dec), Vol. 34(4), 516-520.—Obtained 3 measurements from each of 34 psychology students: (a) size of the entoptic afterimage, (b) apparent distance of such image, and (c) the distance of the screen for the projected afterimage of the same size as the entoptic one. From the average size of the entoptic afterimages, theoretical distances for each S were computed. Statistical analysis showed that the differences between the distances of the screen from 1 side, and the theoretical distances and the apparent distances of the entoptic afterimages from the other side, were significant. Results are interpreted as a proof that the spaces of the projected and entoptic afterimages are not comparable. The difference between the apparent distances of the entoptic afterimages and theoretical distances, predicted on the basis of Emmert's law, was not significant. The latter result is interpreted as a proof that Emmert's law for projected afterimages is also valid for the entoptic ones. It is concluded that there are as many boundaries of the entoptic space as there are different sizes of entoptic afterimage.—*Journal abstract.*

122. **Gogel, Walter C.** (U. California, Santa Barbara) **The validity of the size-distance invariance hypothesis with cue reduction.** *Perception & Psychophysics*, 1971(Jan), Vol. 9(1-B), 92-94.—Asserts that results of 2 recent studies by W. Epstein and A. A. Landauer (see PA, Vol. 44:3060 and 44:3062), "interpreted by these authors as being in opposition to the size-distance invariance hypothesis and in agreement with the direct perception of retinal size," in reality "support the size-distance invariance hypothesis and consequently are in opposition to the conclusion that a perception of size can occur independently of perceived distance." The procedures and conclusions of the studies are discussed in terms of the new interpretation.—*M. West.*

125. **Newman, Colin V.** (U. Birmingham, England) **The influence of texture density gradients on judgments of length.** *Psychonomic Science*, 1970(Sep), Vol. 20(6), 333-334.—48 adult Ss judged the relative lengths of pairs of surfaces viewed successively under restricted monocular conditions. Artificial deformations in the gradients of texture density derived from 1 surface in each pair had a significant influence on judged length. Surfaces on which the packing density of the texture units progressively increased toward the horizon were judged as longer than surfaces of equal physical dimensions but with evenly spaced texture elements.—*Journal abstract.*

126. **Sperling, George.** (Bell Telephone Lab., Murray Hill, N.J.) **Binocular vision: A physical and a neural theory.** *American Journal of Psychology*, 1970(Dec), Vol. 83(4), 461-534.—Discusses 3 major processes of binocular vision: accommodation (a), horizontal vergence (v), and fusion (u). A simple model of energy levels illustrates how the same external stimulus may produce different vergence states, and how extreme values of vergence can be achieved. The model applies directly to vertical vergence and torsional eye rotations. A similar model fits the accommodation and fusion systems and can be extended to account for the v-a-u interactions. Neural structures underlying the systems differ. The neural theory of fusion proposes 2 neural binocular fields (NBFs): a primary NBF for fine details and depth discrimination in the stimulus, and a secondary NBF for coarse details and large depth signs. The fusion model illustrates how the same retinal stimulus may produce different stable perceptual states, depending on recent stimuli, and accounts for fusion and rivalry within the same system and neurons. A general definition of image blur, and a quantitative analysis of the multistable phenomena in rivalry and fusion are included.—*Journal abstract.*

127. **Stanley, Gordon.** (U. Melbourne, Victoria, Australia) **Varying amount of static visual noise and the Ansbacher effect.** *Psychonomic Science*, 1970(Sep), Vol. 20(6), 343-344.—128 undergraduates viewed either a stationary or a moving illuminated arc line in 1 of 4 conditions: no static visual noise or 5%, 25%, or 45% static visual noise. The visual noise consisted of randomly placed light circles of 1-cm diameter optically superimposed on the surface of the disk on which the arc line was located. An analysis of variance based on the median magnitude estimates of arc length yielded no significant noise effect, but a significant static/dynamic effect indicating contraction with movement (the Ansbacher effect). Results are discussed in relation to other research on the Ansbacher effect.—*Journal abstract.*

128. **Teghtsoonian, Robert & Teghtsoonian, Martha.** (Smith Coll.) **Scaling apparent distance in a natural outdoor setting.** *Psychonomic Science*, 1970(Nov), Vol. 21(4), 215-216.—Obtained magnitude estimations of

apparent distance in an outdoor setting from 48 high school students. It was found that judgments of apparent distance in outdoor settings are power functions of physical distance, just as they have been shown to be in indoor settings. But the exponents obtained out of doors are not only appreciably lower—all less than 1—but are affected by range: the exponent is largest for the smallest ratio of extreme distances.—*Journal abstract.*

129. Teghtsoonian, Robert & Teghtsoonian, Martha. (Smith Coll.) **The effects of size and distance on magnitude estimations of apparent size.** *American Journal of Psychology*, 1970(Dec), Vol. 83(4), 601-612.—Studied size constancy in a natural viewing situation by constructing scales of apparent area for irregular polygons at several viewing distances by the methods of magnitude estimation (number matching). These scales had the form of a power relation, $\psi_A = kA^n$, where ψ_A is apparent area and A is physical area. For a stimulus of fixed area, ψ_A did not decrease with increasing distance, but increased (in Exp. I, with 16 high school students) or remained constant (in Exp. II, with 18 undergraduates). The relation between ψ_A and distance depended, 1st, on k , the scale factor, which, like ψ_A itself, increased with distance in Exp. I and remained constant in Exp. II, and 2nd, on n , the exponent, which was invariant with distance in both experiments.—*Journal abstract.*

Color Vision

130. Balcom, Margaret M. (National Bureau of Standards, Inst. for Basic Standards, Washington, D.C.) **Influence of red and blue pre-adaptation on hue matching of purple samples.** *Journal of the Optical Society of America*, 1970(Jan), Vol. 60(1), 118-121.—Attempted to show the effect, if any, of chromatic adaptation on hue matching of purple painted samples of different saturations. 5 experienced Os were adapted for 1 min. to a red field, then asked to find the hue match for each of 3 test samples from among a set of samples representing the complete hue circuit in 100 steps at middle saturation. The 3 test samples were of slightly greater saturation and representative of a range of purple samples. The entire procedure was repeated with blue and neutral preadapting fields, all under source C (over-all covering of grey cardboard) illumination. Results indicate that preadaptation did influence the hue-match selections, the average red-blue adaptive shift being about 1 Munsell hue step. Os made systematically different hue matches for the same test sample, in accordance with their ages. A method for determining graphically the state of adaptation at the time when the hue judgments were made showed that the chromaticity of the test samples was at least as influential as either the neutral surround used or the preadaptation stimuli.—*Journal abstract.*

131. Chason, L. Ralph & Mockovak, William P. (U.S. Air Force Academy) **The effects of sound on color intensity perception.** *U.S. Air Force Academy Technical Report*, 1970(Dec), No. 70-6, 15 p.—Sensory interaction occurs when the response elicited by a sense modality due to a specific stimulus is significantly affected by the simultaneous stimulation of that sensory system by any other sense modality in the body. This experiment was concerned with the interaction of audition and vision where the auditory conditions consisted of no sound, pleasant sound, and unpleasant sound (as judged by the

S), and the visual conditions consisted of equal intensity judgments on red, green, and blue lights against a white standard. The data from 30 Ss are discussed including main effects and interaction of experimental conditions. The hypotheses concerning the differential sensitivity of the dark-adapted eye to red, green, and blue colored lights were confirmed. The hypotheses concerning the influence of audition on vision were not confirmed. The potential influence of the reticular activating system is discussed in light of these findings.—*Journal abstract.*

133. Siegel, Michael H. & Siegel, Anne B. (Albion Coll.) **A comparison of techniques for measuring hue appearance.** *Behavior Research Methods & Instrumentation*, 1971(Jan), Vol. 3(1), 1-4.—Evaluated and compared the techniques of color naming, color estimation, and color setting in the measurement of color appearances. Although results with 7 Os indicate that the 3 techniques produced nearly identical results, Os' showed a clear preference for the color estimation technique.—S. Knapp.

134. Sternheim, Charles E. (U. Maryland) **Chromatic contrast and visual sensitivity: Evidence for disparate mechanisms.** *Journal of the Optical Society of America*, 1970(May), Vol. 60(5), 694-699.—Varied the hue, saturation, and brightness of a field of white light by the simultaneous chromatic stimulation of neighboring retinal areas. Visual sensitivity was measured in 3 Ss with normal vision by determining the threshold luminance of chromatic test stimuli presented as increments upon these background fields. The spatial position of the test stimulus was varied within the central field of induced color. Chromatic-contrast effects extending over relatively large retinal areas may be maintained by a mechanism operating at a different level of the visual system than that at which increment sensitivity is determined. Data are discussed in relation to the explanation of chromatic contrast based upon selective lateral adaptation and the concept of opponent-response induction. (27 ref.)—*Journal abstract.*

138. Dimond, Stuart J. (University Coll., Cardiff, Wales) **Hemisphere function and word registration.** *Journal of Experimental Psychology*, 1971(Feb), Vol. 87(2), 183-186.—Directed word pairs to 1 hemisphere or the other of 22 Ss using a divided visual field technique. Each word was composed of 4 letters presented in succession. When 1 member of the word pair was directed to 1 hemisphere and the other member to the other, words directed to the right hemisphere of right-handed Ss were reported more accurately than words directed to the left. This finding implicates the primary visual projection hemisphere as of importance regarding language registration in the intact brain. When both members of the word pair were directed to the same hemisphere, those directed to the left were more accurately reported than those directed to the right. The left hemisphere has a greater capacity than the right for registering large amounts of concurrent information.—*Journal abstract.*

(Laurentian U., Sudbury, Ontario, Canada) **Selective attention and individual preferences in judgmental responses to multifeature patterns.** *Psychonomic Science*, 1970(Oct), Vol. 21(2), 67-68.—Conducted 3 experiments with a total of 19 undergraduates to show that the physical features of star-shaped patterns were preferred and used consistently as a basis of judgment across all pairs of patterns and throughout various tasks. Superior prediction of responding was achieved when it was hypothesized that within any pattern pair the feature having the relatively larger difference in level would be emphasized in responding. Both consistent preferences and selective attention to relative discriminability of features effect judgments for pattern pairs.—*Journal abstract.*

141. Torrey, Charles C. (Macalester Coll.) **Trace localization and the recognition of visual form.** *American Journal of Psychology*, 1970(Dec), Vol. 83(4), 591-600.—In Exp. I with 65 undergraduates as Os, previous research by H. Wallach and P. Austin (see PA, Vol. 29:2017) suggesting localized storage of visual traces was replicated, using new stimulus materials. In Exp. II with 48 undergraduates as Os, an alternative hypothesis accounting for trace selection by phenomenal, rather than anatomical, locus was examined and rejected. In Exp. III with 120 undergraduates as Os, the possibility that eye-movement tendencies may provide mediating stimuli that govern trace selection was explored, with negative results. The hypothesis of differential trace localization originally put forth by Wallach and Austin is the most economical explanation of their results, but neither their research nor the present experiments indicate whether the localized trace is best described as a template or as a set of features.—*Journal abstract.*

143. Yesselson, Melvyn D. (U. Rochester) **A study of the relationship between nystagmus eye movements**

and the oculogyral illusion. *Dissertation Abstracts International*, 1970(Oct), Vol. 31(4-B), 2335-2336.

Brightness & Contrast Discrimination

144. Anderson, David E. (U. Oregon, Medical School, Portland) **Border contrast as a function of retinal locus.** *Perception & Psychophysics*, 1971(Jan), Vol. 9(1-B), 105-109.—Reports that when the visibility of a small test spot was measured by direct brightness matching at various locations along the white edge of a black and white border, the white background was perceived by 2 Os as becoming progressively brighter as the border was approached. The effect was greater when a corner was neared. Moreover, greater effects, i.e., larger differences between the edge effect and base level (no border) were found at distances farther removed from the fovea ($0^{\circ}12'$ to $3^{\circ}52'$).—*Journal abstract.*

145. Cole, Robert E. & Diamond, A. Leonard. (Simon Fraser U., Vancouver, British Columbia, Canada) **Amount of surround and test-inducing separation in simultaneous brightness contrast.** *Perception & Psychophysics*, 1971(Jan), Vol. 9(1-B), 125-128.—Investigated simultaneous brightness contrast in the fovea of 3 male undergraduates with 20/20 vision as a function of (a) amount of surround of the inducing fields (Exp. I), and (b) separation between the test and inducing fields (Exp. II). Circular test and match fields subtending 14 min. (radius) were used throughout. The inducing field, held constant in area, was a circular annulus (615 sq. min.) varying from a quadrant on 1 side of the test circle to an annulus completely surrounding the test circle. Test-field apparent brightness was not significantly affected by amount of inducing-field surround when the separation between centers of the test and inducing fields was held constant (Exp. I). Exp. II, however, showed that apparent brightness increased significantly as the separation between the centers of the test and inducing fields was increased.—*Journal abstract.*

146. Fitzgibbons, David J. & Marino, Dominic R. (Inst. of Living, Hartford, Conn.) **Technique for measurement of individual differences in autokinetic response tendency.** *Perceptual & Motor Skills*, 1970(Dec), Vol. 31(3), 915-918.—Describes a technique for measuring autokinetic response tendency by increasing background illumination to the cease setting, the point of background illumination at which the perception of movement is destroyed. Data from a study with 42 Ss show that single trials can be used to order Ss in a manner consistent with the use of the mean score from a series of trials. Scores are also shown to remain constant over time.—*Journal abstract.*

AUDITION

150. Butler, Robert A. (U. Chicago) The monaural localization of tonal stimuli. *Perception & Psychophysics*, 1971(Jan), Vol. 9(1-B), 99-101.—Asked 17 normal hearing Ss with 1 ear occluded to locate tone bursts, .25, .4, .6, .9, 1.4, 2, 3.2, 4.8, and 7.2 kHz., generated by a loudspeaker concealed from view. The S's response was to call out that number, from a series of numbers arranged horizontally, behind which he thought the tone bursts originated. Ss perceived the sounds as emanating from the side of the unoccluded ear, but their judgments bore no consistent relation to the actual location of the sound source. Rather, Ss showed a strong tendency to locate a tone burst, within the range of .9-7.2 kHz., in a fixed spatial relation to the next higher- and lower-pitched tone burst. Distorting the pinna of the unoccluded ear failed to modify the perceptual pattern. It is suggested that the perceived spatial relations among the various frequencies was a by-product of the tonotopic organization of the auditory nervous system.—*Journal abstract*.

Perception

153. Black, J. W. The magnitude of pitch inflection. *Archivio di Psicologia, Neurologia e Psichiatria*, 1969(Jan), Vol. 30(1), 5-16.—Upward inflections were judged to be of greater extent than downward ones, slow inflections were judged to be of greater extent than fast ones, large inflections were judged to be of greater extent than small ones, and different psychophysical procedures yielded the same results.—L. L'Abate.

154. Calfee, Robert C. (Stanford U.) Effects of payoff on detection in a symmetric auditory detection task. *Perceptual & Motor Skills*, 1970(Dec), Vol. 31(3), 895-901.—Tested the assumption, common to several models for signal detection, that increased payoff should have no effect on detection rate, in a 2-interval forced-choice auditory signal detection task. The signal occurred equally often in each interval, and amount of gain or loss was the same for both intervals. Payoff values (0, .1, .5, and 1¢) were changed within sessions in 50-trial blocks. Detection rate increased noticeably in Exp. I with 6 female undergraduates, was significant in Exp. II with 4 female undergraduates, and had no effect in Exp. III with 4 graduate students. It is suggested that with minimal payoffs of the sort typically used, significant effects may depend on convincing S of the

importance of the incentive. Analysis of conditional error probabilities showed that errors were more likely to follow errors, which suggests periodic variation in level of attention.—*Journal abstract*.

155. Elflner, L. F. (Florida State U.) Continuity in alternately sounded tone and noise signals in a free field. *Journal of the Acoustical Society of America*, 1969(Oct), Vol. 46(4, Pt. 2), 914-917.—Reports 2 experiments that employed 10 normally hearing listeners who demonstrated an ability to concentrate on an interrupted white noise that alternated with a tonal burst to demonstrate continuity effects in a free-field situation and to investigate the effects of frequency and level of the signal component, the duration of the noise component, and the angular separation of the 2 components. Results show that the level and the duration variables effected changes in continuity thresholds. Angular separation did not appreciably affect the perception of continuity in the noise.—*Journal abstract*.

156. Green, David M. (U. California, San Diego) Masking with continuous and pulsed sinusoids. *Journal of the Acoustical Society of America*, 1969(Oct), Vol. 46(4, Pt. 2), 939-946.—Measured the detectability of a brief 10-msec sinusoidal signal in the presence of a sinusoidal masker using 3 experienced undergraduate Os. The frequency of the masker was varied while the frequency of the signal was fixed at either 250, 1000, or 2800 Hz. In Exp. I, the masker was either continuous or gated; when gated, it was also 10 msec. in duration and occurred simultaneously with the signal. When the masker was continuous, the data agreed essentially with those reported by R. L. Wegel and C. E. Lane. If the masker was gated and near the signal in frequency, there was little difference in the amount of masking produced by the gated and the continuous conditions, although gating the maskers produced somewhat more masking, about 5 db. When the frequency of the signal and masker differed, e.g., in the case of a masker at 1200 cps with a signal at 1000 cps, the gated condition produced substantially more masking, about 40 db. Exp. II measured how the signal level must be changed to compensate for an increase or decrease in the masker level. In Exp. III, the signal was presented at various delays after the onset of the maskers to determine how long the masker must be present to achieve, effectively, a continuous-masker condition. (21 ref.)—*Journal abstract*.

157. Perrott, David R. & Fobes, James L. (California State Coll., Los Angeles) Autokinesis as a binaural localization phenomenon: Effects of signal bandwidth. *Journal of Experimental Psychology*, 1971(Feb), Vol. 87(2), 172-175.—Tested 40 experimentally naive Ss with normal hearing under diotic listening conditions. Apparent movement effects were inversely related to signal bandwidth. Auditory autokinesis can be accounted for in terms of the known organizational structure of the auditory system and the adaptation of the peripheral auditory system's response to a prolonged steady-state acoustical signal.—*Journal abstract*.

158. Raab, David H. & Taub, Harvey B. (Brooklyn Coll., City U. New York) Click-intensity discrimination with and without a background masking noise. *Journal of the Acoustical Society of America*, 1969(Oct), Vol. 46(4, Pt. 2), 965-968.—Revealed 3 unusual effects of intensity discrimination employing click stimuli observed by 2 adult Ss: (a) clicks are difficult to differentiate with respect to intensity; (b) the Weber function differs from those usually obtained with

stimuli of longer duration; and (c) click-intensity discrimination is improved by the addition of a continuous background noise. Since click stimuli have virtually no energy variations, the results cannot be explained by stimulus-oriented theories of detection and discrimination. (16 ref.)—*Journal abstract.*

159. Sullivan, Richard; Warren, Richard, & Dabice, Margaret. (New York U., Medical Center) **Minimal aversion thresholds for white noise: Adaptation.** *American Journal of Psychology*, 1970(Dec), Vol. 83(4), 613-620.—Presented noises of 4 different amplitudes to 20 undergraduates, who then judged minimal aversion thresholds for a white noise presented binaurally in ascending and descending series. Both adaptation and series influenced their judgments, but the differences in judgments were greater between series types than across adaptation levels. Findings suggest that thresholds for the attribute of aversive loudness can be effectively specified. The possibility of a psychological scale of aversiveness common to all sensory systems is discussed.—*Journal abstract.*

160. Ward, Lawrence M. & Lockhead, G. R. (Duke U.) **Response system processes in absolute judgment.** *Perception & Psychophysics*, 1971(Jan), Vol. 9(1-B), 73-78.—In 3 studies with 3 Ss in each, consistent relationships were found between Ss' absolute judgments of the value of a stimulus and the previous sequence of both stimuli and responses. The form and magnitude of these sequential effects are shown to depend on the presence or absence of feedback on a task difficulty. The pattern of the sequential effects found allows the conclusion that they are due to purely response-system processes. A 2-stage model of the judgment process is proposed, and it is argued that observed assimilative effects account for the central tendency effects observed in category judgments.—*Journal abstract.*

Speech Discrimination

161. Franklin, Barbara. (San Francisco State Coll.) **The effect on consonant discrimination of combining a low-frequency passband in one ear and a high-frequency passband in the other ear.** *Journal of Auditory Research*, 1969(Oct), Vol. 9(4), 365-378.—The Fairbanks Rhyme word lists spoken by a male were filtered into 2 passbands, 240-480 cps (LB) and 1020-2040 cps (HB). The consonant articulation score for 36 normal-hearing young adults was 40% when the HB was presented at 0-db sensation level (SL) to 1 ear. When the LB, which contained negligible information in isolation, was added either to the same or opposite ear at 20-db SL, the articulation scores rose to about 61%. When the LB was added at 40-db SL to the same ear, the score was 54%, but dropped to 38% if the LB was added to the same ear. Evidently adding the LB to the opposite ear can under some conditions increase the total information available by reducing the masking of speech by speech. (21 ref.)—*Journal summary.*

164. McGlone, Robert E. & Brown, William S. (State

U. New York, Buffalo) **Identification of the "shift" between vocal registers.** *Journal of the Acoustical Society of America*, 1969(Oct), Vol. 46(4, Pt. 2), 1033-1036.—Investigated the ability of listeners to identify the point where speakers indicated that they shifted from 1 register to another during phonation. 9 females and 10 males phonated an ascending and descending series of tones, identifying the level at which they perceived a shift between registers. These phonations were recorded and played back to judges, who made the same identifications on a perceptual basis. Results indicate that (a) females were slightly less variable in self-judgment of their shift between registers than were males, and (b) greater variation in register-shift identification was found for judges listening to the recording than for the speakers' self-judgments while phonating. It is concluded that registers should be more rigorously defined—perhaps on both a perceptual and physiological basis—in order to account for the difficulty in perceptual identification.—*Journal abstract.*

Audiometry

165. Durrant, John D. & Shalloo, Jon K. (Northwestern U., Auditory Research Lab.) **Effects of differing states of attention on acoustic reflex activity and temporary threshold shift.** *Journal of the Acoustical Society of America*, 1969(Oct), Vol. 46(4, Pt. 2), 907-913.—Observed temporary threshold shift (TTS) and acoustic reflex activity in 20 normal hearing Ss under several different states of attention. The Zwislocki acoustic bridge (Model 3) was used to monitor acoustic reflex activity. Compliance shifts (changes in relative compliance) were measured during exposure of the contralateral ear to a 1000-Hz narrow-band noise presented at 105-db SPL, and TTS was measured at 1000 Hz. for the contralateral ear after approximately 4½ min. of noise exposure. These measures were taken under 3 different conditions or modes of attention as defined by task performance: reverie (no task performance, high auditory attention), intelligibility test, and high visual attention (visual-motor task). Also, levels of attention, as operationally defined by levels of task performance, were considered. It is concluded that there is a so-called factor involved in acoustic reflex activity although task performance per se, not type of task, is the important factor. However, such a factor in TTS, if observed, is probably an artifact of the type of task performance of the listener. (20 ref.)—*Journal abstract.*

166. Fraser, Winifred D. & Petty, Joseph W. (Wayne State U., Auditory Research Lab.) **A comparison of three methods for measuring auditory adaptation.** *Journal of Auditory Research*, 1969(Oct), Vol. 9(4), 352-357.—Examined 3 variations of the Simultaneous Dichotic Loudness Balance method frequently used in measuring perstimulatory auditory adaptation, selected to examine the effect of a continuous change relative to a discrete change in the intensity of the comparison stimulus. 7 Ss were run under tracking, fixed-intensity, and varied-intensity procedures. The temporal course of adaptation for all procedures was highly similar to previous studies, there was no statistically significant difference in the absolute level of adaptation due to procedure, and the often observed large individual differences were also present here. It is felt that when these data are considered along with previous methodological studies the only reasonable conclusion is that

the discrepancy found in the amount of adaptation reported by various investigators for like stimulus parameters is the result primarily of sample composition rather than of any aspect of the stimulus or procedure.—*Journal summary.*

167. Grauer, Robert A. & Dunn, Bruce E. (U. Calgary, Alberta, Canada) **Changes in monaural pitch jnd following pure tone stimulation of the contralateral ear.** *Journal of Auditory Research*, 1969(Oct), Vol. 9(4), 314-317.—Research in the past has tended to focus on the peripheral aftereffects of auditory stimulation. This experiment determined 1 effect of prolonged auditory stimulation on the CNS. The left ear of 9 normal-hearing young adults was stimulated by pure tones of 550-1200 cps at 45 dbB (an intensity low enough to be inaudible in the right ear) for 4 min., subsequently, changes in pitch just noticeable difference (jnd) at 900 cps in the right (nonstimulated) ear was studied. The pitch jnd in the right ear either increased or decreased depending on the frequency of the prior tone in the left ear. Prior stimulation at 700 cps increased the jnd whereas stimulation at 900 cps decreased it. It is concluded that there is some aftereffect of mild auditory stimulation in the CNS. Results are discussed in terms of their possible relationship to absolute pitch shifts and auditory localization. (16 ref.)—*Journal summary.*

168. Greenspan, Carrie F. & Pollock, Kenneth C. (U. Miami, Medical School) **Response variability and personality factors in automated audiometry.** *Journal of Auditory Research*, 1969(Oct), Vol. 9(4), 386-390.—Many factors have been investigated to account for response variability of Bekesy tracing widths in normals. This study examined the contribution of personality variables. A swept-frequency pulsed Bekesy tracing was obtained monaurally for 40 normal-hearing young adults. The FPPS yielded scores on 15 personality scales. Factor analysis and multiple linear regression analysis revealed that mean tracing width tended to increase, and was predictable at the 90% level, with a multiple R of .48, standard error of estimate of 1.6, when an individual scored low on the achievement, succorance, and dominance scales, and high on the deference and abasement scales. It is concluded that personality variables do, in part, contribute to the mean excursion size of Bekesy tracings among normals. (25 ref.)—*Journal summary.*

170. Hipkind, Nicholas M. & Rintelmann, William F. (Michigan State U.) **Effects of experimenter bias upon pure-tone and speech audiometry.** *Journal of Auditory Research*, 1969(Oct), Vol. 9(4), 298-305. Investigated E bias and E effect in clinical audiological evaluation. 4 experienced and 4 inexperienced audiologists administered conventional pure-tone or pure-tone and speech audiometric tests under 4 conditions of prior information. For any S, a tester was given: (a) the results of an experienced audiologists's assessment, (b) no information, (c) assessment results falsely recorded as "better," or (d) assessment results falsely recorded as "worse" than actual. Subgroups of adults had sensorineural, conductive, or no hearing loss; subgroups of children had normal or defective articulation. There was no significant difference between pure-tone audiometric scores obtained by skilled or unskilled testers as an unequivocal result of having either correct vs.

erroneous previous test information provided that strict threshold measurement procedures were adhered to. As a note of caution, the findings do not imply that relatively untrained testers can obtain valid or reliable pure-tone thresholds from Ss presenting difficult masking problems. (27 ref.)—*Journal summary.*

172. Soderquist, David R. (U. North Carolina, Greensboro) **Frequency analysis and the critical band.** *Psychonomic Science*, 1970(Oct), Vol. 21(2), 117-119.—Examined the performance of 2 groups of 4 male Ss on an auditory frequency analysis task. The groups were differentiated in terms of musical training and background. Predictions based on the assumption that frequency analysis is dependent upon the critical band were derived from 2 synthetically produced inharmonic complex stimuli. Results indicate that nonmusicians are inferior to professional musicians in their ability to analyze complex waveforms. Results suggest that musicians possess critical bands which are rectangular in shape and approximately 20% narrower in width than published values.—*Journal abstract.*

173. Watson, Charles S. & Gengel, Roy W. (Central Inst. for the Deaf, St. Louis, Mo.) **Signal duration and signal frequency in relation to auditory sensitivity.** *Journal of the Acoustical Society of America*, 1969(Oct), Vol. 46(4, Pt. 2), 989-997.—Determined levels of monaural signals at behavioral threshold by a psychophysical method of adjustment for 7 highly trained listeners. Thresholds were studied as a function of signal frequency (octave steps, from 125-8 kHz) and of signal duration (logarithmic steps, from 16-1024 msec.). Measurements were made in the presence of a contralateral broad-band masking noise with a spectrum level of 30-db SPL. The time constant, τ , estimated from at least 12 replications of each measurement, was found to range systematically from values considered normal (125-175 msec.) by some earlier investigators, at low frequencies, to much lower values (30-70 msec.) at high frequencies. Comparison between the performance of listeners with normal audiograms and those with high-frequency hearing loss shows this interaction between frequency and the time constant to be similar for both samples. Data are also compared to the results of a 2nd experiment that employed a 2-alternative forced-choice psychophysical method. (26 ref.)—*Journal abstract.*

174. Weller, Ernest M. (U. Louisville) **Auditory adaptation, signal detection, and the coding of loudness.** *Dissertation Abstracts International*, 1970(Oct), Vol. 31(4-B), 2333.

175. Wilson, Richard H. & Carhart, Raymond. (Northwestern U., Auditory Research Lab.) **Influence of pulsed masking on the threshold for spondee.** *Journal of the Acoustical Society of America*, 1969(Oct), Vol. 46(4, Pt. 2), 998-1010.—Studied the changes in masking for spondee words that result from varying both the level and the interruption rate of a white-noise masker with 14 normal-hearing Ss and 14 Ss with sensorineural hearing loss diagnosed as resulting from cochlear otosclerosis. The masker was a white noise and was presented monaurally at either 90-db SPL or 30-db sensation level (SL). It was either continuous or was pulsed at rates of 1, 10, or 100 sec with 50% duty cycle. During the burst-off $1/2$ of each cycle, the noise was

either dropped 14 db. in level or was fully interrupted. The masked speech-reception threshold (SRT) was not improved re the masked SRT in continuous noise when the 30-db SL masker was pulsed 100 times/sec. Reduction in masking was observed under all other circumstances of cycling the noise. This reduction was more pronounced when the noise was completely interrupted rather than only modulated by 14 db., when the masker was at its higher level (90-db SPL as opposed to 30-db SL), and when the masker was interrupted at the slowest rate (1 interruption/sec). During equivalent conditions, the reduction in masking was greater for normal-hearing Ss than for those with cochlear otosclerosis. Appreciable residual masking (re SRT in quiet) persisted across the range of all parameters of noise level, modulation depth, cycling rate, and type of S encompassed. This last finding appears to be contradictory to some of the results from earlier studies but not to others. This discrepancy, along with other aspects of the present findings, are discussed.—*Journal abstract.*

CHEMICAL SENSES

176. Gregson, R.A. & Simmonds M. B. (U. Canterbury, Christchurch, New Zealand) **Qualitative gustatory characteristics of disodium-5'-guanylate.** *British Journal of Psychology*, 1971(Feb), Vol. 62(1), 81-88.—Reports descriptions of the taste qualities of a nucleotide, disodium-5'-guanylate, under 2 different response sets, lenient and stringent. Control comparison stimuli were deionized water and weak sodium chloride, and near threshold taste concentrations were used. Results with 20 undergraduates, 10 under each response set, indicate that D5'G has a complex taste, and induces a marked false positive detection response pattern which resembles its own taste. Implications for methodology in gustatory psychophysics are noted. (26 ref.)

177. Mitchell, M. J. & McBride, R. L. (U. Canterbury, Christchurch, New Zealand) **Effects of propanol masking odor on the olfactory intensity scaling of eugenol.** *Journal of Experimental Psychology*, 1971(Mar), Vol. 87(3), 309-313.—Performed a constant stimulus, category scaling, olfactory intensity experiment using eugenol as a target odor, scaled in the presence of a simultaneously presented propanol masking odor. 18 male and 8 female undergraduates served as Ss. The slope of the psychophysical power function, relating sensation and stimulus magnitudes, decreased with increasing concentration of the mask. Olfaction is tentatively inferred to be a synthetic sensory continuum within the context of this study.—*Journal abstract.*

178. Pangborn, Rose M. (U. California, Davis) **Individual variation in affective responses to taste stimuli.** *Psychonomic Science*, 1970(Oct), Vol. 21(2), 125-126.—Reports that in previous experiments on hedonic responses to the taste of sodium-chloride solutions it was shown that 3 Ss had distinctly liked and 5 Ss had distinctly disliked increasing concentrations. A paired-preference presentation of the same concentrations of sodium chloride resulted in almost identical conclusions for the same 9 university employees, but not with solutions of monosodium glutamate. A 2nd group of 29 male prison inmates demonstrated 3 hedonic distributions to increasing concentrations of sodium chloride and of sucrose—increased dislike, increased liking, or an increase followed by a distinct reduction.—*Journal abstract.*

179. Smith, David V. (Rockefeller U.) **Taste intensity as a function of area and concentration: Differentiation between compounds.** *Journal of Experimental Psychology*, 1971(Feb), Vol. 87(2), 163-171.—Asked 24 undergraduates to give magnitude estimates of several concentrations of sodium chloride, citric acid, quinine hydrochloride, and saccharin for 4 differently sized areas of stimulation. Taste intensity was found to be a power function of both area and concentration with the equation $I = C^a \times A^b$ describing the relation between intensity (I), concentration (C), and area (A). Equal intensity functions ($C \times A^m = k$) for the various compounds had different exponents (m) that were equal to the ratio of the exponents for area and concentration (p/n). Since the 4 compounds had different exponents for concentration (n) but not for area (p), the differential area effect on threshold reported by earlier workers appears to be the result of unequal binding strengths for the various taste stimuli rather than a differential distribution of sensitivities to compounds on the tongue.—*Journal abstract.*

(Colorado State U.) **Determination of a DL using two-point tactual stimuli: A signal-detection approach.** *Psychonomic Science*, 1970(Nov), Vol. 21(4), 198-199.—Determined a DL for 2-point tactual stimuli, all of which were supraliminal. A signal-detection procedure was employed, and subsequent research possibilities in this area were considered.—*Journal abstract.*

184. Diespecker, D. D. (Wollongong University Coll., New South Wales, Australia) **Learning a vibrotactile code at five different loci.** *Cortex*, 1970(Sep), Vol. 6(3), 293-298.—5 groups of Ss each learned the same 9-element vibrotactile code (3 durations and 3 intensities) but through different areas of skin. The 5 areas were the left upper arm, forearm, wrist, palm, and fingertips. Although there was a significant difference between the groups over 10 practice trials there was no clear distal-proximal ordering effect. There was a significant learning effect for the groups, and the performance of Ss learning the code through the skin of the wrist was superior.—*R. Gunter.*

185. Haslam, Diana R. (U. Bristol, England) **The effect of anchoring upon pain threshold.** *Psychonomic Science*, 1970(Oct), Vol. 21(2), 107-108.—Reports an experiment designed to measure the effect of anchoring upon the heat-pain threshold. 10 male and 10 female undergraduates served as Ss. The anchor stimulus, which took the form of repeated application of a low-intensity stimulus prior to the assessment of pain threshold, was found to have a significant effect. It is concluded that the low threshold values found when a small stimulus interval is used in the assessment of heat-pain threshold by the limiting method can probably be attributed to this effect.—*Journal abstract*.

186. Hoff, Phyllis A. (U. New Hampshire) **Scales of selected aspects of kinaesthesia.** *Perception & Psychophysics*, 1971(Jan), Vol. 9(1-B), 118-120.—50 male undergraduates, all of whom participated in 5 experiments, made judgments of (a) thickness by finger span, (b) extent of arm movement, (c) heaviness of lifted weights, (d) force by handgrip, and (e) speed of arm movement. The method was fractionation: halving the magnitude of each stimulus. Comparisons were made in terms of the size of the exponent of the sensory scale.—*Journal abstract*.

ENVIRONMENTAL EFFECTS

SLEEP & FATIGUE & DREAMS

HYPNOSIS & SUGGESTIBILITY

188. Land, Jay M. & Greenberg, Roger P. (State U. New York, Upstate Medical Center, Syracuse) **The influence of some situational variables on initial hypnotic susceptibility.** *International Journal of Clinical & Experimental Hypnosis*, 1971(Jan), Vol. 19(1), 37-45.—The relationship between situational variables and hypnotic susceptibility has been a topic of considerable controversy. 2 situational variables were manipulated: the attitude of E and the prestige of the experimental situation. 3 E-attitudes were presented by having E treat Ss in a warm, cold, or neutral manner. Ss were 48 paid female volunteers, over 21 yr. of age. Prestige was varied by using a clinic conference room with E as a doctor and a laboratory storeroom with E as a student. The hypnotist was on tape and was clearly differentiated from E. Results do not support the idea that initial hypnotic susceptibility is affected by these extraneous variables. (Spanish & German summaries) (21 ref.)—*Journal abstract*.

190. Linetzkii, M. L. (Ukrainian Inst. for Advanced Training of Physicians, Kharkov, USSR) **New information of the neurodynamics of perception of inadequate suggestions under hypnosis.** *Soviet Psychology*, 1967(Win), Vol. 6(2), 44-50.—Discusses (a) the neurodynamic characteristics manifested in repeated experiments with suggestions addressed to various

functions (gastric juice secretion, carbohydrate and water metabolism); and (b) the relationships between autonomic manifestations of perceived suggestions and sensations.

191. Sheehan, Peter W. (U. New England, Armidale, New South Wales, Australia) **An explication of the real-simulating model: A reply to Reyher's comment on "Artificial induction of posthypnotic conflict."** *International Journal of Clinical & Experimental Hypnosis*, 1971(Jan), Vol. 19(1), 46-51.—J. Reyher (see PA, Vol. 43:7646) has criticized P. W. Sheehan's application of the real-simulating model of hypnosis and has challenged his findings on the artificial induction of posthypnotic conflict. Reyher's critique indicates a lack of understanding of the nature of the differences between the methodology he has adopted and that of the real-simulating model. Results from application of the real-simulating model show that Reyher's findings may indeed indicate that there are genuine effects of hypnosis, but their genuineness is far from having been proven. (Spanish & German summaries)—*Journal abstract*.

MOTIVATION & EMOTION

192. Aaronson, Bernard S. (Bureau of Research in Neurology & Psychiatry, Princeton, N.J.) **Some affective stereotypes of color.** *International Journal of Symbolology*, 1970(Aug), Vol. 2(1), 15-27.—66 males and females rated 11 colors on the Emotions Profile Index. Emotional stereotyping appeared for all colors but green. Sex differences in affective color response were found for yellow, yellow-green, purple, blue, black, orange, and white. Cluster analysis showed: red, orange, and yellow associated with outgoing exuberance; red, yellow-green, and purple, with hostility; and purple, gray, and black, with asocial despondency. An activation series running from a high for red to a low for blue seemed present. Achromatic colors all seemed negatively related to activation.—*Journal abstract*.

193. Agrawal, K. G. (National Inst. of Health Administration & Education, New Delhi, India) **Studies in colour symbolism: I. Object context and abstract colour labels.** *Indian Journal of Psychology*, 1970(Jun), Vol. 45(2), 141-157.—Selected 77 colors representing the entire range of saturation or brightness to show to college girls. 10 abstract and 10 concrete object context color names with high frequency were selected. Eliciting qualifiers for colors and names, 15 semantic differential scales were finalized. Adding another 5 scales from a previous study. 20 color names and patches and 10 objects (color context) were rated on 20 scales by 3 groups of 32 college girls each. Scales on scale factor analyses revealed 3 common factors: evaluation, potency, and activity. Objects fell between names and patches of colors. Objects appearing in color name context and color names seem to influence affective meaning of each other. Most objects and patches were more positively rated than the color names.—*Journal summary*.

194. Barclay, Andrew M. (Michigan State U.) **Information as a defensive control of sexual arousal.** *Journal of Personality & Social Psychology*, 1971(Mar), Vol. 17(3), 244-249.—Investigated the effect information about the true nature of an experiment has when the experiment deals with areas of defensive concern, e.g., sexuality. 61 male undergraduates, aged 21 yr. and older, were shown a sexually arousing film or a boring film

under conditions where Ss either knew the true purpose of the study or were misinformed. Pre- and postarousal urine samples were analyzed for urinary acid phosphatase, a possible indicator of sexual arousal. A significant interaction showed that informing Ss caused a paradoxical finding: acid-phosphatase secretion was high in control Ss, while Ss seeing an arousing movie showed no change from prearousal levels. Previous findings of increased acid phosphatase following arousal were replicated for noninformed Ss. Sexually experienced Ss responded to the film with increases in acid-phosphatase secretion, while sexually inexperienced Ss did not. Results are discussed in terms of defensive control of arousal and its implication for research dealing with high-concern, high-defensiveness areas, e.g., sexuality.—*Journal abstract.*

203. Sullivan, Richard. (New York U., Medical Center) **Magnitude estimation of anxiety.** *Psychonomic Science*, 1970(Nov), Vol. 21(4), 209-211.—Compared subjective estimates of anxiety and MA scale scores. 26 male undergraduates rated and estimated magnitudes of anxiety experienced during a stress condition. Findings suggest that the direct method of magnitude estimation is an appropriate scaling procedure for the measurement of transitory anxiety. MA scale scores were not related to

anxiety levels expressed on either category or estimation scales. It is suggested that the method of direct estimation of anxiety may serve as a corollary to other measures of transitory anxiety and prove useful in behavioral therapy settings.—*Journal abstract.*

204. Zajonc, Robert. (U. Michigan, Research Center for Group Dynamics) **Brainwash: Familiarity breeds comfort.** *Psychology Today*, 1970(Feb), Vol. 3(9), 32-35, 60-64.—Various studies involving Turkish words, Chinese-like characters, and men's faces supported the hypothesis "that the mere repeated exposure of an unfamiliar stimulus is enough to increase one's attraction to that stimulus." Correlational evidence from word-frequency counts and experimental data from rats added further support. Possible explanations suggest that novel stimuli evoke uncertainty and conflict. The resulting stress is reduced and the stimulus becomes better liked when the individual develops a stable way of responding to the stimulus. Increased exposure encourages the development of such stable response patterns and, therefore, leads to increased attraction.—*E. J. Posavac.*

ATTENTION & EXPECTANCY & SET

205. Carr, Gordon D. (Tufts U.) **Introversiion-extraversiion and vigilance performance.** *Dissertation Abstracts International*, 1970(Oct), Vol. 31(4-B), 2299.

206. Epstein, Seymour & Bahm, Robert. (U. Massachusetts) **Verbal hypothesis formulation during classical conditioning of the GSR.** *Journal of Experimental Psychology*, 1971(Feb), Vol. 87(2), 187-197.—Tested 2 groups of 16 undergraduates, 1 of which gave verbal estimates of the likelihood of receiving shocks throughout the experiment, and 1 which did not, in a conditioning situation designed to eliminate reflex orienting responses. The CS consisted of rectangles of uniform size arranged along the perimeter of a circle, around which moved a constant-speed pointer. The UCS was a shock delivered at the end of the CS. Verbal estimates facilitated conditioning and caused the acquisition curve to resemble that of other forms of conditioning, rather than to decrease during reinforcement, as was found for the nonverbalizing group and is typically found in GSR conditioning. The combined data from GSRs, verbal estimates, and postsession interviews provided a relatively comprehensive picture of cognitive processes during conditioning, which were more complex than initially suspected. (19 ref.)—*Journal abstract.*

207. Fletcher, Janet F. & Yates, Aubrey J. (U. Western Australia, Nedlands) **The repetition of single speech sounds under delayed auditory feedback.** *British Journal of Psychology*, 1971(Feb), Vol. 62(1), 73-79.—Conducted 3 experiments with 25 male and 25 female undergraduates in each, to determine the effect of delayed auditory feedback (DAF) on the rate of repetition of single speech sounds. Other variables investigated were variation in repetition rate among speech sounds under DAF, and the effect of the S's sex on repetition rate. Ss were found to repeat sounds significantly fewer times under DAF. There was no significant variation among sounds repeated under DAF, nor was there a sex effect. A 4th experiment, with 24 male and 24 female undergraduates, found no relationship between performance under synchronous auditory feedback and speech breakdown under DAF.

Experimental variables are discussed which may account for the opposite findings of R. A. Chase (see PA, Vol. 34:5283).—*Journal abstract.*

208. Hritzuk, John & Janzen, Henry. (U. Calgary, Alberta, Canada.) A Soviet and Western concept of set. *Alberta Journal of Educational Research*, 1970(Dec), Vol. 16(4), 217-225.—Administered the Luchins Hidden Word Test of 12 nonsense words and the Uznadze set of 3 spheres and 4 circles to 31 females and 20 males. No significant differences were noted between the tests in either the haptic or visual modality for either the set fixation or extinction phases. There appears to be little empirical difference, therefore, between the Luchins concept of set as habituation and the Uznadze concept of set as readiness.—*N. M. Chursky.*

209. Mettee, David R. (Yale U.) Rejection of unexpected success as a function of the negative consequences of accepting success. *Journal of Personality & Social Psychology*, 1971(Mar), Vol. 17(3), 332-341.—Hypothesized that: (a) acceptance of unexpected success can involve negative consequences other than psychological inconsistency; (b) unexpected success would be rejected more firmly when the added negative consequence of future subjective failure was highly probable than when it was obscure or minimally probable; and (c) unexpected success perceived as transient would be viewed as self-irrelevant and hence acceptable, because such a success would have no psychological implications for the individual. Hypotheses were supported by data from an experiment with 84 high school females. A self-irrelevant group did not reject unexpected success (i.e., did not perform to fail). When accepting unexpected success involved resolving inconsistency, success was rejected to a greater extent than when it was self-irrelevant ($t = 3$). When acceptance of unexpected success involved 2 negative consequences—inconsistency and the possibility of future subjective failure—rejection was even more pronounced than in the inconsistency-only case ($t = 2.3$). Results are discussed in terms of their implications for developing viable methods of changing ingrained negative self-expectancies.—*Journal abstract.*

210. Seymour, Philip H. (Dundee U., Scotland) Conceptual uncertainty and the latency of judgments of the congruence of word-shape pairs. *Acta Psychologica, Amsterdam*, 1970(Dec), Vol. 34(4), 451-461.—Recorded the latencies of verbal reports of the congruence of simultaneously displayed printed words and shapes. The labels used were black, white, large, small, square, and circle, the comparison shapes being squares or circles having 1 of 2 values on the dimensions of color and size. 12 undergraduates served as Ss. Latencies were about 700 msec. where Ss reported "yes" for same pairs and "no" for different pairs, but were nearly 250 msec. slower where this response allocation was reversed. Manipulation of the size of the set of labels from which displays were drawn within a block of presentations had little effect on the latency under either response allocation. However, where the set was limited to 2 labels referring to a single dimension, times were faster for congruent pairs than for incongruent pairs. This effect was eliminated as the size of the set of labels was increased. It is concluded that the congruence effect relates to the decision processes involved in computing the word-shape comparisons.—*Journal abstract.*

213. Warm, Joel S. & Alluisi, Earl A. (U. Cincinnati) Influence of temporal uncertainty and sensory modality of signals on watchkeeping performance. *Journal of Experimental Psychology*, 1971(Mar), Vol. 87(3), 303-308.—Assessed the effects of signal density on the detection of increments in the duration of regularly occurring acoustic and visual pulses in a 1-hr watchkeeping task. 5 levels of signal density (6, 12, 24, 48, and 96 signals/hr) were combined factorially with the 2 sensory modalities to produce a total of 10 experimental conditions. Overall performance efficiency of 70 17-54 yr. old undergraduates, in terms of detection probability and RT to correct detections, was greater for acoustic than for visual signals. Variations in signal density were not associated with significant changes in the probability of correct detections. RT increased as a linear function of signal surprisal due to density—an information measure of the temporal uncertainty of signals. (15 ref.)—*Journal abstract.*

REACTION TIME

216. Bartz, Albert E. (Concordia Coll., Moorhead, Minn.) Reaction time as a function of stimulus uncertainty on a single trial. *Perception & Psychophysics*, 1971(Jan), Vol. 9(1-B), 95-96.—Measured in a discrete choice RT experiment RTs between the onset of a light and the start of S's pencil toward that light. The RTs of 166 unpracticed undergraduates, not aware that their 1st practice trial was being measured, increased as a linear function of stimulus uncertainty. Since this occurred without any prior experience, the effect must have been due to S's set or expectancy regarding the nature of the future task, formed while the instructions for the task were being given.—*Journal abstract.*

217. Bernstein, Ira H. & Edelstein, Barry A. (U. Texas, Arlington) Effects of some variations in auditory input upon visual choice reaction time. *Journal of Experimental Psychology*, 1971(Feb), Vol. 87(2), 241-247.—Replicated in Exp. I with 5 undergraduates the facilitating effect of irrelevant binaural tone upon 2-choice (left vs. right) visual RT. This effect was enhanced by monaural tone ipsilateral to the choice and largely eliminated by monaural tone contralateral to the choice. Comparable effects were obtained in Exp. II with 5 undergraduates using high- vs. low-frequency binaural tones and 2 visual alternatives that were located diagonally with regard to fixation. Auditory and visual stimuli were thus describable as high or low. RT was more rapid when both frequency and vertical position

were similar (both high or both low) than when they were opposite (1 high, the other low). The RT difference between ipsilateral (Exp. I) or similar (Exp. II) and control visual-auditory pairings were essentially the same when tone conveyed no response information vs. when it did convey response information.—*Journal abstract.*

218. **Christina, Robert W.** (State U. New York, Brockport) **Minimum visual feedback processing time for amendment of an incorrect movement.** *Perceptual & Motor Skills*, 1970(Dec), Vol. 31(3), 991-994.—Discusses some of the research on the average minimum time required by a performer to amend an incorrect movement based upon his ability to process visual feedback. A decremental effect of the psychological refractory period on minimal visual feedback processing time is suggested. (20 ref.)—*Journal abstract.*

219. **Clement, David E. & Carpenter, James S.** (U. South Florida) **Relative discriminability of visually-presented letter pairs using a same-different choice-reaction time task.** *Psychonomic Science*, 1970(Sep), Vol. 20(6), 363-365.—23 pairs of capital letters representing 4 combinations of high and low visual and auditory similarity, and 17 pairs of identical letters were used as stimuli in a same-different choice RT task. 8 Ss (4 of each sex) performed on 780 discrimination trials. Results indicate that same-different judgments were made essentially on the basis of visual characteristics, with letter pairs of high visual similarity having slower RTs than pairs of low visual similarity. Left-to-right order of letters in a pair had no effect, nor did auditory similarity. "Same" judgments had a more restricted range of RT and tended to be slower than "different" judgments.—*Journal abstract.*

220. **Dainoff, Marvin & Haber, Ralph N.** (Miami U.) **Effect of acoustic confusability on levels of information processing.** *Canadian Journal of Psychology*, 1970(Apr), Vol. 24(2), 98-108.—Employed a modification of M. I. Posner and R. F. Mitchell's choice RT design in which 10 experimentally naive undergraduates were required to respond "same" or "different" to simultaneous pairs of letters. Response was always on the basis of name identity (e.g., AA and Aa are "same," AB is "different"). Letter pairs were selected from populations of acoustically confusable or nonconfusable letters. Each pair of letters was either physically identical, had identical names, or had different names. The RTs to physically identical pairs were fastest, and did not differ between confusable and nonconfusable pairs. For all other comparisons, RT to acoustically confusable pairs took longer than to nonconfusable pairs. Results appear to support the hypothesis of an auditory encoding stage at which comparisons between items are made on the basis of acoustic components of their memory representations. (French summary) (20 ref.)—*Journal abstract.*

222. **Geffen, Gina; Bradshaw, J. L., & Wallace, G.** (Monash U., Clayton, Victoria, Australia) **Inter-hemispheric effects on reaction time to verbal and nonverbal visual stimuli.** *Journal of Experimental Psychology*, 1971(Mar), Vol. 87(3), 415-422.—Describes 5 RT experiments with a total of 60 right-handed undergraduates on laterality differences in visual perception. 3 experiments employed numerical digits and 2 used human faces which are immediately recognizable

but difficult to encode verbally. RTs were found to be sensitive to laterality differences in visual perception. Nonverbal stimuli (faces) were processed faster when presented in the left visual field. Conversely, stimuli which were verbally encoded and required an identificatory response were processed more quickly when presented in the right visual field. It is suggested that these differences could be due (a) to the time taken to cross from 1 cerebral hemisphere to the other, (b) to asymmetries between the hemispheres in their capacity to process verbal and nonverbal material, or (c) to both. (25 ref.)—*Journal abstract.*

223. **Hinrichs, James V.** (U. Iowa) **Probability and expectancy in two-choice reaction time.** *Psychonomic Science*, 1970(Nov), Vol. 21(4), 227-228.—Measured RTs of 12 male and 12 female undergraduates to 2 stimuli which were presented in a 2:1 ratio. The mean RT was inversely related to the probability of stimulus presentation, but no difference was found when the mean RT was calculated conditional on Ss' predictions of stimulus presentation. The probability effect in choice RT is interpreted as depending upon a weighted combination of fast RTs to correctly predicted stimuli and slow RTs to incorrectly predicted stimuli.—*Journal abstract.*

224. **La Berge, David.** (U. Minnesota) **Effect of type of catch trial upon generalization gradients of reaction time.** *Journal of Experimental Psychology*, 1971(Feb), Vol. 87(2), 225-228.—Obtained generalization gradients of tones from 4 experienced Ss with a Donders type c reaction under conditions in which the catch stimulus was a tone of neighboring frequency, a tone of distant frequency, white noise, a color, or nothing. When the catch stimulus was another tone, the latency gradients were steep, indicating strong control of responding by a frequency discrimination process. When the catch stimulus was a red light or nothing, the gradients were flat, and displaced downward, indicating that responding was being controlled by an early detection process.—*Journal abstract.*

225. **Naätänen, Risto.** (U. Helsinki, Inst. of Psychology, Finland) **The diminishing time-uncertainty with the lapse of time after the warning signal in reaction-time experiments with varying fore-periods.** *Acta Psychologica, Amsterdam*, 1970(Dec), Vol. 34(4), 399-418.—Examined the observation that the shortest anticipatory, or foreperiods, in a randomized series of different durations usually yield the longest RTs, whereas the fastest RTs are found with the shortest foreperiods when they are constant within each set of trials. 5 experienced and 8 naive undergraduates were each tested twice. It was found that when the factor of increasing probability was eliminated, the shortest foreperiods in the series no longer yielded the longest RTs. It is concluded that the main reason for the diverging tendencies noted is the information-generating nature of the passage of time following the warning signal in RT experiments with randomizing foreperiods of different durations. 4 factors are proposed as exerting an influence on the relationship between the foreperiod and the RT when varying foreperiods are delivered in random order following a rectangular distribution of foreperiods. (23 ref.)—*Journal abstract.*

227. **Poppel, Ernest.** (Max Planck Inst. of Physiology

of Behavior, Starnburg, W. Germany) **Excitability cycles in central intermittency.** *Psychologische Forschung*, 1970, Vol. 34(1), 1-9.—Choice RT with 2 alternatives (optic and acoustic stimuli) was measured in an experiment with 24 Ss. Individual distributions for both modalities were plotted. From a total of 48 distributions 46 were multimodal. The temporal difference between successive peaks had a mode value of 30 msec. For the interpretation of the results oscillatory processes are assumed. In a scanning model the hypothetical oscillations are independent of the stimuli. Such a model would predict only unimodal distributions. Since multimodalities were observed, the data can best be accounted for by a model of excitability cycles.—*Journal summary*.

233. Jones, Elvis C. (Frostburg State Coll.) **Schema learning with low redundancy patterns.** *Psychonomic Science*, 1970(Oct), Vol. 21(2), 74-75.—Attempted to determine if the tendency of Ss to perform poorly on schema learning tasks with patterns below 50% redundancy was due to either (a) inability to abstract the schema with low-redundancy patterns, or (b) a limited usefulness of the schema as an aid in the efficient encoding of low-redundancy patterns. 60 undergraduates who were pretrained on the schema prototype performed better when transferred to 40% redundant patterns than Ss who received only 40% redundant patterns. This indicates that poor performance with 40% redundant patterns is largely due to a failure to abstract the schema. The use of schematic learning sets, with a gradual decrease in redundancy, is suggested as a possible means for improving Ss' ability to abstract schemata from low-redundancy patterns.—*Journal abstract*.

schedules and response cost. *Dissertation Abstracts International*, 1970(Nov), Vol. 31(5-B), 2991.

235. Klatzky, Roberta L. (Stanford U.) **Inter-hemispheric transfer of test stimulus representations in memory scanning.** *Psychonomic Science*, 1970(Nov), Vol. 21(4), 201-203. Presented test stimuli in either the right or left visual field during a memory scanning task. Ss indicated whether or not a given test stimulus, either a letter or a picture, matched 1 of a previously presented set of letters. RTs were recorded and plotted as a function of the size of the set of letters. Results with 8 right-handed female undergraduates are in agreement with the hypothesis that the 2 types of test stimuli are processed by different cerebral hemispheres with differing stimulus representations.—*Journal abstract*.

236. Messick, David M. (U. California, Santa Barbara) **Learning probabilities of events: A discussion.** *Acta Psychologica, Amsterdam*, 1970(Dec), Vol. 34(2-3), 172-183.—Discusses a number of theoretical issues which pertain to the question of how people learn event probabilities. It is concluded that while classical probability learning studies provide inadequate answers to this question, such studies do suggest some interesting conceptual issues. It is suggested that new theoretical efforts are needed. 2 recent theoretical developments are discussed and compared.—*Journal abstract*.

237. Miller, Frank D., Kalin, Richard S., & Meyer, Philip A. (U. South Dakota) **The effects of temporal variables on the acquisition of human avoidance behavior.** *Psychonomic Science*, 1970(Nov), Vol. 21(4), 241-243.—Manipulated signal duration and trace interval in a 3 × 3 factorial design that also permitted interstimulus interval (ISI) comparisons. 90 undergraduates were given avoidance training employing a blast of pressurized air directly behind the ear as the noxious stimulus, a button depression as the avoidance response, and a light as the warning signal. The most striking effect of the temporal variables was on avoidance latency, where longer latencies were associated with longer ISIs. Resistance to extinction appeared quite strong, and the suddenness of conditioning resembled all-or-none learning. The similarity of these results to previous findings and their significance are discussed. (15 ref.)—*Journal abstract*.

238. Schwartz, Marian. (U. Wisconsin) **Stimulus frequency and meaningfulness varied independently in the learning of word-number pairs.** *Journal of Experimental Psychology*, 1971(Feb), Vol. 87(2), 289-291.—Manipulated in a factorial design, stimulus Thorndike-Lorge as a within-S variable with 3 levels: stimulus meaningfulness (M), as a between-S variable with 2 levels. Groups of 30 and 20 undergraduate males served as Ss. Stimuli were nouns. The response class (2-digit numbers) was selected to minimize the possibility that differential similarity between stimuli and responses would bias the comparisons between the different stimulus conditions. Results show a significant inverse relation between stimulus frequency and learning, a nonsignificant trend toward better performance with higher stimulus M, and a significant Frequency × M interaction. Subsequent analyses indicate that the frequency effect was confined to the low-frequency vs. medium- and high-frequency comparison within the low-M list.—*Journal abstract*.

241. Vlek, Charles A. (U. Leiden, Netherlands) **Learning probabilities of events: An analysis of the problem and its relevance for the study of decision making.** *Acta Psychologica, Amsterdam*, 1970(Dec), Vol. 34(2-3), 160-171.—Discusses the problem of learning to associate events with their probabilities of occurrence in the context of decision making under uncertainty. Knowledge of probabilities of hypothetical states of the world is essential for adequate decision making. Subjective probabilities assigned to these hypothetical states may be revised using available probabilistic information. Prior and conditional probability distributions may be learned by Ss in the process of observing a random sequence of events occurring with different relative frequencies. Multiple probability learning assumes that during the observation of such a random sequence the S through a perceptual learning process associates the events with subjective probabilities of occurrence. Possible different structures of the event sequence are considered and various questions are asked concerning the effects on learning of several important characteristics of the observed probability distribution. (26 ref.)—*Journal abstract.*

242. Vlek, Charles A. & van der Heijden, Lex H. (U. Leiden, Netherlands) **Aspects of suboptimality in a multidimensional probabilistic information processing task.** *Acta Psychologica, Amsterdam*, 1970(Dec), Vol. 34(2-3), 300-310.—In a probabilistic discrimination learning task 5 male and 6 female undergraduates learned to discriminate between members of families A and B on the basis of normally distributed eye positions in standard faces. On training trials Ss learned the bivariate probability distributions of eye positions for families A and B simultaneously. On test trials Ss classified a given face as either A or B and assigned a posterior probability estimate to their choice. It appeared that Ss widely and consistently differed in the relative weighting of the horizontal and vertical stimulus dimensions, which caused the direction of their inferred subjective likelihood ratio axis to deviate from optimality. It is concluded that differential weighting of stimulus dimensions in multidimensional probability distributions is an aspect of suboptimality in a broader sense than conservative probability estimation.—*Journal abstract.*

243. Whitman, James R. & Anderson, E. Pat. (Veterans Administration Hosp., Tacoma, Wash.) **Transfer effects in part to whole free-recall learning.** *Psychonomic Science*, 1970(Oct), Vol. 21(2), 109-111.—Assigned 33 undergraduates to 3 experimental groups: Group A learned a list of 4 visual figures to the criterion of 2 perfect trials; Group B received additional practice, and Group C received no learning trials with the figures. All groups then received practice on a list of 8 figures, which included those learned by the experimental groups. Positive learning transfer was shown only by Group B. Transfer was not accounted for by an increase in the relative frequency with which overlearned stimuli were recalled while learning the 8 stimuli.—*Journal abstract.*

244. Wicker, Frank W. (U. Texas) **Continuous restricted associations to pictorial and verbal items.** *AV Communication Review*, 1970(Win), Vol. 18(4), 431-439.—Comparisons of verbal and pictorial items in studies of associative learning have often demonstrated greater recognition and recall with pictorial stimuli than with corresponding noun labels. In the present study 30 Ss gave 3 types of continuous restricted associations (single adjectives, verbs, and nouns) to a mixed list of 10 nouns. Findings indicate that pictorial items, because of their explicitness, are more limited in continuous associations than verbal items. This is taken as confirming the value of pictorial concreteness in instructional situations: learning is facilitated by restricting the associative power of stimuli.—D. E. Anderson.

Conditioning

245. Cho, Sam & Mitchell, Daniel S. (American Inst. for Research, Pittsburgh, Pa.) **Stimulus generalization in sensory preconditioning.** *Journal of Experimental Psychology*, 1971(Mar), Vol. 87(3), 405-409.—Conducted 2 experiments to determine (a) whether sensory preconditioning (SPC) results in the establishment of a gradient of stimulus generalization (GSG), and (b) whether the GSG in SPC tests varies as a function of the ordinal position of test stimuli. 192 undergraduates were divided into 12 groups consisting of 4 each of sensory preconditioned (PC), nonpreconditioned (NPC), and perceptual disparity reaction (PDR) groups. 32 PC Ss were presented with 4 paired presentations of light and a 1850-Hz tone, and the remaining 32 PC Ss received 4 paired presentations of light and a 670-Hz tone. NPC Ss received the same stimuli but the light and tones were unpaired. PDR Ss were run separately and did not receive tones in the preconditioning stage. All Ss were then conditioned to avoid a shock to the light, and were subsequently tested on 670-, 1000-, 1400-, or 1850-Hz tones. A significant SPC effect and a GSG indicating complete generalization were found. Results are discussed in light of the compound stimulus hypothesis of D. D. Wickens (see PA, Vol. 34:4009). (19 ref.)—*Journal abstract.*

246. Miller, Frank D., Kalin, Richard S., Eckenroth, William N., & Meyer, Philip A. (U. South Dakota) **Acquisition variables in human avoidance behavior.** *Psychonomic Science*, 1970(Nov), Vol. 21(4), 233-235.—Presented 4 sets of instructions which varied with regard to information about the study. 64 undergraduates were given avoidance training employing a blast of pressurized air directly behind the ear as the aversive stimulus, a button depression as the avoidance response, and a light as the warning signal. Better avoidance performance was obtained for the more informed conditions. The use of an escape contingency was not critical to response acquisition. Resistance to extinction appeared quite strong, and the suddenness of conditioning resembled all-or-none learning. Advantages of the use of the air-blast aversive stimulus are noted.—*Journal abstract.*

247. Peeke, Shirley C. (U. Southern California) **Some factors affecting UCR diminution.** *Dissertation Abstracts International*, 1970(Nov), Vol. 31(5-B), 3032.

248. Remington, R. E. & Strongman, K. T. (U. Exeter, England) **Instruction-dependent facilitation during a pretimeout stimulus in human subjects.** *Psychonomic Science*, 1970(Sep), Vol. 20(6), 348-349.—2 groups of 6

male undergraduates each were run for monetary reward in base line and test conditions using timeout (TO) as a UCS in a CER paradigm. Groups differed only with respect to experimental instructions. 1 group received instructions which established the TO discrimination, the other group received similar instructions which did not. A facilitatory effect during CS in the test phase was found to be mainly a function of those instructions which did not specify the significance of the TO stimulus.—*Journal abstract.*

249. Thornton, Jerry W. & Jacobs, Paul D. (Angelo State U.) **Learned helplessness in human subjects.** *Journal of Experimental Psychology*, 1971(Mar), Vol. 87(3), 367-372.—Attempted to test the learned helplessness hypothesis of J. B. Overmier and M. Seligman (see PA, Vol. 41:4314) with 80 undergraduates. 4 groups differing in shock contingency were given a fixed level of shock, while a 2nd 4 groups were given a variable level of shock. 30 choice RT training trials were given in which 1 group could avoid shock, a 2nd and 3rd group received inescapable shock yoked to the escapable group (1 with a training task to perform and 1 without), and the 4th performed the task but with no shock. 10 test trials, in a completely different task, followed in which all Ss could avoid shock. Results reveal in all phases of the experiment that variable shock is superior to a fixed level as a stress inducer. Learned helplessness is offered as an explanation to the yoked group's lack of responses in test trials. Implications for investigation of learned helplessness in humans and for the use of variable shock are discussed.—*Journal abstract.*

Verbal Learning

250. Cramer, Phebe. (Williams Coll.) **Discrimination as a factor in semantic generalization.** *Journal of Experimental Psychology*, 1971(Mar), Vol. 87(3), 396-400.—Investigated the role of discrimination as a factor in semantic generalization by varying the requirements to discriminate among the stimuli presented during training and/or testing. The influence of priming on the generalization process was also studied. Results with 48 paid undergraduates indicate that priming does modify the direction of generalization and that requirements to discriminate, while lowering the overall level of responsiveness, do not differentially affect the generalization process. (16 ref.)—*Journal abstract.*

251. Dey, Mukul K. (Jersey City State Coll.) **Influence of meaning category on transfer of training and retroactive inhibition in free-recall learning.** *Acta Psychologica, Amsterdam*, 1970(Dec), Vol. 34(4), 462-470.—1 control and 4 experimental groups of 15 male and 15 female undergraduates each learned a list of 20 unrelated words through 3 cycles of alternate study and unpaced free recall. The experimental groups then learned a 2nd list of 20 words, which were neutral, synonyms, opposites, and antonyms to the words of List I, while the control group rested. Finally, a single free-recall trial was administered to all groups to measure List-I retention. Results indicate (a) indeterminate transfer when List-I words were synonyms of the List-II words but positive transfer when the former were either neutral, partly or entirely antagonistic in meaning to the latter; and (b) decrease of retroactive inhibition with change in meaningful relationship from synonymy through neutrality to antonymy. Implications for the associationistic interpretation of free-recall learning are discussed. (17 ref.)—*Journal abstract.*

252. Ellis, N. C. (Texas A & M U.) **Serial task structure and the doctrine of remote associations.** *Psychonomic Science*, 1970(Oct), Vol. 21(2), 121-122.

Utilized criteria for testing the validity of anticipatory and perseverative errors which were derived from the studies by N. J. Slamecka (see PA, Vol. 38:5296) to examine previous research and supplementary studies by N. C. Ellis and W. H. Manning (see PA, Vol. 41:3870). In addition to finding support for Slamecka's concept of item positioning, it was determined that intraitem structure also affects frequency and distribution of serial learning errors. Comparing these results with expectations predicted by remote association theory cast additional doubt on the validity of anticipatory and perseverative errors.—*Journal abstract.*

254. Kirchner, Elizabeth P. (Pennsylvania State U.) **What is vividness?** *Psychonomic Science*, 1970(Nov), Vol. 21(4), 239-240.—Studied the relationship of vividness (V) with semantic-differential dimensions, frequency of occurrence, and associative productivity. 93 undergraduates served as Ss. The V of verbal stimuli was found to be highly related to the semantic differential rating of active (and, in decreasing order of magnitude, to ratings of fast, aggressive, new, hard, and beautiful). It is concluded that studies manipulating V may thus involve demonstration of the effects of the activity dimension on verbal learning. (16 ref.)—*Journal abstract.*

255. Namenek, Andre A. & Schuldt, W. John. (U. Arkansas) **Differential effects of experimenters' personality and instructional sets on verbal conditioning.** *Journal of Counseling Psychology*, 1971(Mar), Vol. 18(2), 170-172.—6 Es, either high or low in conditions of genuineness, warmth, and empathy, attempted verbal conditioning with 36 undergraduate Ss. Ss were given either a set emphasizing the importance of these conditions or 1 in which no specific mention was made of the conditions. Although learning was not clearly demonstrated, results indicate that Es high in these conditions elicited a greater percentage of the response class than did Es low in these conditions. Moreover, results reveal that Ss responded differentially to high- and low-condition Es depending upon whether they received the set condition.—*Journal abstract.*

256. Norvilas, Algimantas A. (St. Louis U.) **The influence of syntactic structure on string learning.** *Dissertation Abstracts International*, 1970(Nov), Vol. 31(5-B), 3031.

257. Quaintance, Barbara & Shapiro, S. I. (U. Hawaii) **The influence of class membership, method of presentation, and restricted association strength on free-recall learning.** *Canadian Journal of Psychology*, 1970(Apr), Vol. 24(2), 70-76.—Composed free-recall lists of subordinate, superordinate, coordinate, contrasting, or unrelated pairs of words and presented them in random or block order for 8 presentation-recall periods. Ss were 310 undergraduates. Category clustering was greater for each related list relative to the unrelated list and for the subordinate and coordinate lists relative to the other related lists. Recall was superior for the subordinate list relative to the superordinate or unrelated list, and no other interlist differences in recall were obtained. All performance measures were superior with

block, compared to random, presentation. The normative strength of conceptual relations was not an influential factor within the range studied. (French summary)—*Journal abstract*.

258. Rogers, Pamela W. (U. Arizona) **The effect of rhyme and meter on acquisition and retention of meaningful verbal material.** *Dissertation Abstracts International*, 1970(Nov), Vol. 31(5-B), 3034.

259. Schmeck, Ronald R. (Southern Illinois U.) **The effect of intralist similarity on serial anticipation and free recall.** *Psychonomic Science*, 1970(Sep), Vol. 20(6), 371.—Investigated the effects of intralist similarity within serial-anticipation and free-recall paradigms, using a factorial design. It was hoped that, by keeping the procedures and material as similar as possible within the 2 paradigms, a comparison of learning within each of the paradigms would result and replicate intralist similarity effects previously demonstrated in separate experiments. Results indicate that high intralist similarity interfered with serial learning but had no statistically significant effect within the free-recall paradigm. Further, the free-recall paradigm produced superior learning only when the intralist similarity was high. The relationship between these results and those reported by L. M. Horowitz (see PA, Vol. 36:2c151H) is discussed.—*Journal abstract*.

260. Turnage, Thomas W. (U. Maryland) **Temporal shifts in the verbal behavior of introductory psychology students.** *American Journal of Psychology*, 1970(Dec), Vol. 83(4), 621-629.—A series of 3 studies using association and paired-associate learning tasks with course-related materials show that both changes in verbal responsiveness and opportunities for associative interference were occurring over the semester in the population sampled (592 undergraduates). Some general implications of these findings for studies using similar pools of Ss and for studies of retroactive mechanisms in long-term retention are considered.—*Journal abstract*.

261. Wallace, William P. & Nappé, Gary W. (U. Nevada) **Re-pairing "rights" and "wrongs" in verbal discrimination learning.** *Journal of Experimental Psychology*, 1971(Mar), Vol. 87(3), 355-360.—Outlined a conceptual scheme for reinterpreting the "re-pairing decrement" in verbal-discrimination (VD) learning. It was hypothesized that the decrement could be accounted for within a frequency theory by liberalizing the "counting" postulate. The decrement was viewed as a special case of increased VD difficulty resulting from a breakdown in the rule that all correct alternatives are uniformly higher in frequency value than their respective incorrect partners. An experimental manipulation with 180 undergraduates was designed to increase the likelihood of a breakdown in this rule. Results support the hypothesis.—*Journal abstract*.

Verbal Paired Associate Learning

262. Bernbach, Harley A. & Bower, Gordon H. (Cornell U.) **Confidence ratings in continuous paired-associate learning.** *Psychonomic Science*, 1970(Nov), Vol. 21(4), 252-253.—Collected confidence ratings of 18 undergraduates in a continuous paired-associate learning task in which items were presented 3 times each. The relation between average confidence and presentation number apparently resulted from a bias to give higher ratings to later presentations of items, independently of whether or not the item was correctly

recalled, and therefore did not indicate a direct relation between recall probability and confidence. The inability of the Ss to discriminate correct from incorrect responses any better between Tests 2 and 3 is consistent with a 2-state theory of confidence judgments and recall.—*Journal abstract*.

263. Berry, Franklin M. & Baumeister, Alfred A. (Columbus Coll.) **Measuring single-letter cue selection in paired associate learning: A methodological note.** *Journal of Psychology*, 1971(Mar), Vol. 77(2), 181-187.—Describes a new approach to the scoring of single-letter cue selection data, based on a same-Ss transfer design, and compares it to the cue-selection methodology of L. Postman and R. Greenbloom (see PA, Vol. 41:3909). An argument was offered to the effect that this newer, "within-Ss double-criterion technique" is actually more useful than that of Postman and Greenbloom—in any situation in which letter selection is measured with a repeated measurements design. Illustrative data are presented to show the analytical usefulness of the newer technique.—*Author abstract*.

264. Dey, Mukul K. (Jersey City State Coll.) **An evidence of position association in serial paired-associate learning.** *Acta Psychologica, Amsterdam*, 1970(Dec), Vol. 34(4), 471-479.—Administered 2 6-unit constant-order paired-associate lists 16 times each in random alternation to 24 male undergraduates. Results reveal that interlist intrusions were elicited at a significantly faster rate between identical than between nonidentical positions. This finding, together with the observation of a gradual decline in the frequency of intrusions between nonidentical positions with increase of positional disparity, provides evidence of association with serial position. (22 ref.)—*Journal abstract*.

265. Ley, Ronald & Locascio, David. (State U. New York, Albany) **Effects of familiarization, associative reaction time, and meaningfulness of response terms in forward and backward paired-associate learning.** *Psychonomic Science*, 1970(Oct), Vol. 21(2), 97-99.—Studied the effect of familiarization of response terms on the forward and backward acquisition rate of a list of paired-associates (PAs), in which the response terms were rated on associative RT and meaningfulness (Mn). 32 undergraduates individually received 20 familiarization trials in which, for 16 Ss, the 8 CVCVC units of the list were the response terms of a PA list which was subsequently learned. For the other 16 Ss, conditions were the same, except that of the CVCVCs of the familiarization list were different from the units of the PA list. Both RT and Mn were significant response-term variables in the forward anticipation learning task, but Mn interacted with familiarization, while RT did not, i.e., familiarization increased the learning rate of low-but not of high-Mn pairs. In the backward learning task, high-Mn pairs were learned in fewer trials than low-Mn pairs, but neither RT nor familiarization had an effect.—*Journal abstract*.

266. McGlaughlin, Alex & Dale, H. C. (U. Hull, England) **Stimulus similarity and transfer in long-term paired-associate learning.** *British Journal of Psychology*, 1971(Feb), Vol. 62(1), 37-40.—Studied acoustic, semantic, visual, and formal similarity in the A-B, A'-B transfer paradigm. Results were analyzed for 8 groups of 10 young enlisted men. Substantial, highly significant, positive transfer was obtained with stimuli that were acoustically or semantically related. For those visually or formally related, the transfer was not

significant. It is concluded that the failure to find significant effects of acoustic similarity in previous long-term memory paired-associate learning studies has been due to a combination of low levels of acoustic similarity with the use of the relatively insensitive retroactive-interference technique.—*Journal abstract.*

267. Miller, Adam & McCrimmon, Russell. (St. Cloud State Coll.) **Extinction for systems learning.** *Psychonomic Science*, 1970(Nov), Vol. 21(4), 207-208.—Assigned 72 male and female undergraduates to learn associations between pairs of colored figures and nonsense words taken from a 4 × 4 miniature system. In a factorial design, the number of different associations from the system that were learned was varied at 2 levels, and an extinction procedure that followed learning was applied in 3 ways. Systems learning occurred. The number of different associations that were learned was not related to accuracy in reproducing the system. For Ss who learned 1/2 the system, the extinction procedure was effective on those associations produced without learning.—*Journal abstract.*

268. Nelson, Douglas L., Fosselman, John R., & Peebles, Jerry W. (U. South Florida) **Words as phonological sequences.** *Journal of Experimental Psychology*, 1971(Mar), Vol. 87(3), 361-366.—Presents 3 experiments using paired-associate word lists with varied word length and cue position. In Exp. I with 54 undergraduates each paired-associate pair consisted of 3 stimulus and 3 response words. Either the 1st, 2nd, or 3rd word of each pair was identical, so that each pair consisted of 2 3-word serial lists which overlapped in various locations. In Exp. II-III with 60 and 48 undergraduates 6-letter words, which overlapped in initial, medial, or terminal bigrams, served as stimuli and responses. Size of the set of potentially relevant response set was also varied. 1/2 the pairs within each overlap condition were selected so that there were a large number of words sharing that bigram within a particular locus, and 1/2 were chosen so that there were a small number of words sharing that bigram. All experiments indicate that providing initial and, to a much lesser extent, terminal portions of a sequence renders greater retrieval access to that sequence than medial components. When degree of phonological similarity was equated, potential set size had no reliable effect.—*Journal abstract.*

269. Norman, Kent L., Levin, Irwin P., & Williams, Jeral R. (U. Iowa) **Mediated responding on a multiple-choice test-only list following the acquisition of a double-function list.** *Psychonomic Science*, 1970(Oct), Vol. 21(2), 77-79.—Investigated a mediation paradigm employing a "double-function" paired-associate list for the acquisition of the A-B and B-C chaining associations. Following acquisition of the double-function list, 24 male and 24 female undergraduates received 4 multiple-choice test trials on a list containing "chaining" items for which 1 alternative could be chosen on the basis of a mediating chain. The tendency to choose the alternative represented by the mediating chain was significantly greater than chance in an unmixed list but was of only borderline significance for chaining items in a mixed list, for which only 1/2 the items were chaining items.—*Journal abstract.*

270. Runquist, Willard N. (U. Alberta, Edmonton, Canada) **Ordinal position of formal similarity among stimuli.** *Journal of Experimental Psychology*, 1971(Feb), Vol. 87(2), 270-273.—Taught 216 undergraduates

paired-associate lists in which pairs of stimulus terms shared 2 letters. The position of the identical letters was systematically varied. Both unmixed lists, in which the locus of identity was the same for all stimuli, and mixed lists, in which the locus differed for different pairs, were used. When the stimuli were words, locus of identity had no effect on performance. With CCC stimuli, identity in middle and last positions was easiest, followed by 1st and middle, and 1st and last. Results are consistent with the hypothesis and letter position will be relevant if stimuli are analyzed into subunits and coded by selection.—*Journal abstract.*

271. Runquist, Willard N. (U. Alberta, Edmonton, Canada) **Stimulus coding and interference in paired-associate learning.** *Journal of Experimental Psychology*, 1971(Mar), Vol. 87(3), 373-377.—Conducted 2 experiments using consonant trigrams and word trigrams as stimuli, in a paired-associate learning task. 432 undergraduates served as Ss. Within each experiment, response terms were either unrelated, shared a letter, or were associated meaningfully in some way with the stimuli. Within each of these 3 conditions were 3 levels of formal similarity among stimuli: no shared letters, shared letters all in the same position in the stimulus, or shared letters in different positions. Results for both stimuli were similar. For neutral responses, the low-similarity list was easiest, with the 2 high-similarity lists being about the same. For the letter-compatible condition, the low-similarity and same position lists were equally difficult, but easier than the different position list. For the meaning-compatible condition, both high-similarity conditions were inferior to the low-similarity list for the consonant stimuli, but only the different position list was inferior for the word stimuli. Results are interpreted in terms of developing specific discriminative stimulus codes by letter selection and meaning.—*Journal abstract.*

272. Schwartz, Marian. (U. Wisconsin) **Subject generated versus experimenter-supplied mediators in paired-associate learning.** *Journal of Experimental Psychology*, 1971(Mar), Vol. 87(3), 389-395.—Assigned 216 undergraduates 1 study and 1 recall trial on a list of 10 pairs. In 1 group, Ss were instructed to generate mediators to help them associate the stimulus and response terms; in another, Ss were supplied with mediators which, on a normative basis, had a high probability of being generated. A 3rd group served as control. Orthogonal variables were study-trial presentation rate (2 sec. vs. 6 sec.) and delay of recall (0 delay vs. 15-min delay). In response recall, the generated condition surpassed the supplied, which surpassed the control. Results of a postrecall mediation questionnaire suggest that the stimulus was a more effective retrieval cue for generated than for supplied mediators, although both types of mediators were equally effective as retrieval cues for the response. In all conditions, a strong relationship was found between reported use of a mediator on the recall trial and correct response recall.—*Journal abstract.*

273. Tilton, Jaylene S. (U. New Hampshire) **Effects of stimulus meaningfulness (m) and Thorndike-Lorge frequency in paired-associate learning in which responses have differential probabilities of occurrence to stimuli.** *Dissertation Abstracts International*, 1970(Nov), Vol. 31(5-B), 3038.

Dissertation Abstracts International, 1970(Oct), Vol. 31(4-B), 2332.

275. **Wearing, Alexander J.** (Yale U.) **On the trace strength of responses varying in correctness.** *Psychonomic Science*, 1970(Nov), Vol. 21(4), 226-227.—Conducted a paired-associate learning experiment to determine if 2 presumed measures of memory trace strength, subjective certainty and latency, were able to distinguish between responses varying in their degree of correctness. Evidence from 61 female undergraduates was found for 3 discrete incorrect-response states: no response, near-random guess, and "tip-of-the-tongue." Response latency was closely related to subjective certainty, however, a sharp change in both latencies and confidence ratings was found between nearly correct and correct responses. It is concluded that the growth function of trace strength may be more complex than previously thought.—*Journal abstract*.

276. **Weinstock, Roy B. & Daly, Helen B.** (Mary Washington Coll., U. Virginia) **Response learning, association formation, and repeated testing effects in a paired-associate task.** *Journal of Experimental Psychology*, 1971(Mar), Vol. 87(3), 343-347.—Assigned 48 male and 48 female undergraduates to 1 of 6 experimental groups. Following 1, 3, or 7 trials of paired-associate (PA) learning, Ss were given separate paper and pencil response-recall, response-recognition, and associative-matching tasks. For both high and low intralist response similarity (IRS) conditions, response learning occurred faster than association formation between responses and stimuli. High-IRS groups performed, in general, more poorly than low-IRS groups on all 3 tasks. Repeated testing on the tasks resulted in greater facilitation for associative matching than for response recall. Results support the B. J. Underwood, W. S. Runquist, and R. W. Schulz (see PA, Vol. 34:4002) 2-stage analysis of PA learning and indicate that between-S designs should be used to test the rate of development of response learning and association formation.—*Journal abstract*.

277. **Williams, Jeral R., Levin, Irwin P., & Norman, Kent L.** (Illinois State U.) **Mediation effects in verbal chaining paradigms as a function of associative strength and the number of stages.** *Journal of Experimental Psychology*, 1971(Mar), Vol. 87(3), 348-354.—Demonstrated a mediated facilitation effect for an A-B, B-C, C-D, A-D extended chaining paradigm with 2 levels of B-C associative strength. Results of 2 experiments with 112 and 120 undergraduates indicate that (a) the magnitude of the effect increased as a function of increasing the strength of Stage 2 associations, (b) the mediated facilitation effect was less in magnitude for the extended chaining paradigm than for a comparable 3-stage paradigm, and (c) the use of S-paced test intervals on Stage 4 of the extended chaining paradigm did not lead to a significant enhancement of the mediation effect. A mediated interference effect was not observed. Results are discussed in terms of the possible role of memory in mediation.—*Journal abstract*.

278. **Wood, Gordon & Bolt, Martin.** (Michigan State U.) **Type of instruction, abstractness and mnemonic system.** *Psychonomic Science*, 1970(Oct), Vol. 21(2), 91-92.—Conducted 2 experiments to determine if the effect of manipulating imagery instructions and peg list abstractness depends on whether a paired-associate or 1-bun technique is used. Results with 108 undergraduates indicate that the paired-associate and 1-bun

techniques yield comparable results regarding the effectiveness of imagery instructions and peg list abstractness.—*Journal abstract*.

Reinforcement

279. **Long, John B.** (U. Kentucky) **The status of discriminative stimuli as secondary reinforcers.** *Dissertation Abstracts International*, 1970(Oct), Vol. 31(4-B), 2259.

280. **Weiner, Harold.** (St. Elizabeths Hosp., Washington, D.C.) **Human behavioral persistence.** *Psychological Record*, 1970(Fal), Vol. 20(4), 445-456.—Human behavior may persist despite the fact that it produces unnecessary (preventable) loss of positive reinforcement. Data are presented which demonstrate that such persistence may be due to (a) a history of conditioning which fails to provide individuals with needed behavioral repertoires and (b) a current environment which reinforces such persistence, i.e., fails to make all net gains of reinforcement contingent upon change. Procedures which prevent or modify behavioral persistence in the face of preventable loss of positive reinforcement are illustrated.—*Journal abstract*.

281. **Weinstein, Lawrence.** (U. Melbourne, Victoria, Australia) **Magnitude of incentive contrast as a function of amount of verbal reward change.** *Psychonomic Science*, 1970(Oct), Vol. 21(2), 65-66.—Investigated human response to the variable of magnitude of reward change. In Exp. I with 17 male and 18 female undergraduates, a decrease in incentive magnitude resulted in negative incentive contrast effects, which were a positive function of the amount of verbal reward reduction. In Exp. II with 15 male and 15 female undergraduates, an increase in amount of reward produced positive incentive contrast effects, which were, as in Exp. I, a monotonic function of the amount of reward change. It is concluded that the magnitude of incentive contrast effects in human Ss is a positive function of the variable of magnitude of reward change.—*Journal abstract*.

282. **Weinstein, Lawrence & Colucci, Vincent M.** (U. Melbourne, Victoria, Australia) **Increase in incentive amount with verbal reinforcement.** *Psychonomic Science*, 1970(Oct), Vol. 21(2), 83-84.—Studied the responses of 13 male and 11 female undergraduates to an increase in incentive size. An increase in the amount of verbal reinforcement resulted in gradual, as opposed to sudden, increases in behavior and no evidence of positive incentive contrast effects. These results with human Ss agree with the data obtained from animal Ss, and suggest that a shift in incentive size in humans affects learning as opposed to some more temporary mechanism.—*Journal abstract*.

MEMORY

283. **Ackroff, John M. & Rouse, Richard O.** (Williams Coll.) **TSD and coding in STM.** *Psychonomic Science*, 1970(Nov), Vol. 21(4), 231-232.—60 undergraduates listened to a list of words and identified repeated words upon hearing them. Interspersed with the repetitions were words that were associatively or acoustically related to the repeated words. The intrusion errors were analyzed and the differences across word class found to be highly significant. Application of signal-detection theory provided a means of quantifying this difference. It

is concluded that the coding strategy for words is primarily associative, and that an acoustical strategy is almost never used.—*Journal abstract.*

284. **Birnbaum, Isabel M.** (U. California, Irvine) **Comment on "Initial-recall grouping in free-recall learning," by John A. Robinson.** *Psychonomic Science*, 1970(Nov), Vol. 21(4), 225.—Argues that the data do not permit the inference of J. A. Robinson (see PA, Vol. 44:20037) that the maintenance of organization of initially recalled words retards free-recall learning.—*Journal abstract.*

285. **Boltwood, Charles E. & Blick, Kenneth A.** (Ohio State U.) **The delineation and application of three mnemonic techniques.** *Psychonomic Science*, 1970(Sep), Vol. 20(6), 339-341.—Determined what mnemonic techniques Ss would employ in learning a list of 19 unrelated nouns. In Exp. I, 32 undergraduates used the first-letter (FL), clustering (C), and descriptive-story (DS) techniques. In Exp. II 3 groups (N = 146) applied the mnemonic techniques, and recall was compared to a no-mnemonic condition. No significant differences were found at the immediate-recall test; however, 1 wk. later the DS and C techniques produced significantly higher levels of recall, while 8 wk. later only the DS technique produced a significantly higher level of recall.—*Journal abstract.*

286. **Carey, Peter W.** (Lexington School for the Deaf, New York, N.Y.) **Verbal retention after shadowing and after listening.** *Perception & Psychophysics*, 1971(Jan), Vol. 9(1-B), 79-83.—Tested 72 undergraduates with normal speech and hearing who shadowed or listened to stories that had been recorded at 1 word/sec (wps), 2 wps, and 3 wps on word recognition, semantic retention, and syntax recognition. At the slowest rate, shadowers' word recognition and semantic retention were somewhat higher than listeners' scores, but this difference disappeared at faster rates. Significant positive correlations among all 3 retention scores were observed for listeners, but for shadowers word recognition was unrelated to either of the other 2 retention measures. Results are discussed in terms of monitoring during shadowing. Implications for experiments on selective attention are considered.—*Journal abstract.*

287. **Cermak, Greg; Schnorr, John, & Buschke, Herman.** (Stanford U.) **Word recognition as a function of spelling direction during study and test.** *Psychonomic Science*, 1970(Oct), Vol. 21(2), 127-128.—Varied factorially the spelling direction (backward or forward) of words presented for study and test. During recognition 16 male and 7 female undergraduates indicated which word of each test pair had been presented for study, and the incorrect choice of each pair was a homophone, a synonym, or a word unrelated to the correct choice. Recognition was worst with synonym distractors and best with unrelated word distractors. For each type of distractor, recognition was better for backward-spelled study words than for forward-spelled study words, and words spelled in the same direction in both study and test were recognized better than words spelled in a different direction during study and test. The latter result supports the hypothesis that visual information may be important for word recognition. The latencies of correct recognition responses suggest that memory of decoding acts can facilitate subsequent similar decodings.—*Journal abstract.*

288. **Checkosky, Stephen F.** (Lake Forest Coll.) **Speeded classification of multidimensional stimuli.**

Journal of Experimental Psychology, 1971(Mar), Vol. 87(3), 383-388.—Manipulated 2 factors in a speeded classification experiment: (a) the number of alternative stimuli in a predetermined memory set (M), and (b) the number of dimensions that need to be categorized to insure a correct response (D). Results with 12 right-handed female undergraduates indicate that the joint effect on mean RT was additive. This is interpreted as evidence that they are mediated at separate information-processing stages. Results are not consistent with Sternberg's exhaustive comparison model. Generation of a visual code for each of the memory set items is proposed to account for the effects of M. A subsequent stage in which this visual code is interrogated dimension by dimension is proposed to account for the effects of D.—*Journal abstract.*

293. **Gallagher, Joseph W. & Patterson, William.** (U. Alabama) **The effect of two types of associative linkage and position of association linkage on the recall of sentences.** *Psychonomic Science*, 1970(Oct), Vol. 21(2), 75-76.—Examined the influence of 2 types of association data on the recall of sentences in 2 experiments with 30 and 90 undergraduates. Results show that "syntactic restricted" associations facilitated the recall of sentences while typical free associative connections may have some influence. However, the predominant underlying variable appears to be a syntactic association. The position of syntactic associative connection in the sentence had no differential effect on recall. It is suggested that in studying the associative hierarchies of individuals some attention be given to the fact that several associative hierarchies may exist.—*Journal abstract.*

294. **Gorfein, David S.** (New Coll.) **Effects of intralist activity on free-recall performance.** *Psychonomic Science*, 1970(Sep), Vol. 20(6), 331-333.—Studied performance of 60 undergraduates in a free-recall paradigm under 5 conditions of intralist activity. The activities were designed in such manner as to vary the likelihood of blocking either rehearsal of the items hooking contiguous items together, or both processes. Data support an explanation of free recall in terms of both of these processes being active with the major determinant of recall being the recirculation or rehearsal of the to-be-remembered item.—*Journal abstract.*

295. **Gruneberg, Michael M.** (University Coll. of Swansea, Wales) **A dichotomous theory of memory. Unproved and unprovable?** *Acta Psychologica, Amsterdam*, 1970(Dec), Vol. 34(4), 489-496.—Considers the theoretical and empirical basis for a dichotomy between short-term memory (STM) and long-term memory (LTM). It is noted that the theory was developed in order

to account for rapid forgetting, and that rapid forgetting is the criterion by which it is decided whether or not material has progressed beyond STM. A major problem for a dichotomous theory is the commonly held view, based on the work of G. Keppel and B. J. Underwood (see PA, Vol. 38:5326) that rapid forgetting in STM is due to interference, as is forgetting in LTM. This, if true, is fatal for a dichotomous theory. Even at an empirical level, however, it is noted that there is no evidence which unequivocally supports a dichotomous theory. A single system theory is recommended. It is concluded that those holding a dichotomous theory must do more than show the cause of forgetting in STM—it must be shown not to be the cause of forgetting in LTM. (22 ref.)—*Journal abstract*.

296. Halff, Nancy F. (U. Wisconsin) **Organization in free recall learning: The effects of taxonomic and grammatical list arrangements.** *Dissertation Abstracts International*, 1970(Nov), Vol. 31(5-B), 3023.

297. Hamilton, Peter & Hockey, G. R. (Medical Research Council, Applied Psychology Unit, Cambridge, England) **Recency/primacy ratio: A short test of task orientation.** *Psychonomic Science*, 1970(Nov), Vol. 21(4), 253-254.—13 adult Ss recalled 60 9-digit lists presented consecutively for 15 min. at a rate of 2 digits/sec. An analysis of errors by serial position revealed that (a) primacy errors in the 1st 2 list positions increased over time, and (b) recency errors in the last 2 list positions decreased over time. The ratio recency errors/primacy errors showed a consistent downward trend over the testing period. It is suggested that this ratio is an index of the degree of active information processing and may be a useful reflection of the vigilance type of decrement, which can be derived from the use of a short simple test.—*Journal abstract*.

298. Herring, Barbara S. & Bryden, M. P. (Box 146, Hagersville, Ontario, Canada) **Memory colour effects as a function of viewing time.** *Canadian Journal of Psychology*, 1970(Apr), Vol. 24(2), 127-132.—Instructed 60 Ss to judge the color of 2 objects, an apple, and a circle, relative to the colors of 5 samples. The apple was judged significantly redder than the circle, indicating a memory color effect. There was also an indication that this effect was stronger when the test object was viewed for 300 msec. than when it was seen for either more or less time. These results fit a modified version of J. S. Bruner's model of perceptual processing. (French summary)—*Journal abstract*.

299. King, David J. (State U. New York, Oswego) **Initial observations on the learning of connected discourse to complete mastery.** *Psychonomic Science*, 1970(Sep), Vol. 20(6), 329-330.—25 undergraduates learned a 95-word-long story to complete mastery. All recalls of each S were scored for accuracy of recall by 2 dependent variables, number of words and number of 3-word sequences. The mean number of trials to successive criteria were computed for both word and sequence measures. The relationship between successive criteria and the learning of words is curvilinear, while the relationship between successive criteria and sequence learning is a straight line.—*Journal abstract*.

300. Klatzky, R. L., Juola, J. F., & Atkinson, R. C. (Stanford U.) **Test stimulus representation and experimental context effects in memory scanning.** *Journal of Experimental Psychology*, 1971(Feb), Vol. 87(2), 281-288.—Asked 12 female undergraduates to perform a memory-scanning task in which they indicated

whether or not a given test stimulus (letter or picture) matched 1 of a previously memorized set of letters. The test stimuli presented during a given session were either exclusively letters (a letter session), exclusively pictures (a picture session), or a random sequence of both (a mixed session). RT functions relating response latency to the size of the memorized set of letters were plotted, and data are discussed in the context of the scanning models previously proposed by S. Sternberg. The RT functions of letter sessions and picture sessions were found to be consistent with the exhaustive model for memory scanning. However, the functions for mixed sessions deviated markedly from the predictions of such a model. The context in which a scanning task is imbedded appears to have a substantial effect on RT functions.—*Journal abstract*.

301. Loeb, Jane. (U. Illinois, Champaign) **Differences between retrieval cues in effectiveness as recall aids.** *Psychonomic Science*, 1970(Nov), Vol. 21(4), 193-194.—Instructed 75 undergraduates to learn a list of words to which 2 sets of cues were relevant with 2-16 items/cue. Cues for which relevant items were relatively high-frequency free associates (conceptual cues) led to higher recall than did cues to which list items were relatively low-frequency responses (alphabetical cues). Free-recall instructions led to higher recall than did alphabetical cues to which more than 6 items were relevant, but recall from large conceptual categories was not inferior to free recall of the same items. Results suggest that rather than sharing a common limit on the number of items they can retrieve, cues vary in effectiveness. Thus, free-recall performance will be affected by the particular subjective units into which S organizes a set of words, as well as by the number of such units he uses.—*Journal abstract*.

302. Loftus, Elizabeth F., Freedman, Jonathan L., & Loftus, Geoffrey R. (Stanford U.) **Retrieval of words from subordinate and superordinate categories in semantic hierarchies.** *Psychonomic Science*, 1970(Nov), Vol. 21(4), 235-236.—Investigated retrieval from long-term memory in an experiment in which S was shown a category name and asked to respond with a word belonging to the category (e.g., animal-horse, bird-robin). RTs of 32 undergraduates taken to retrieve a member of a given category were not significantly different from the time taken to retrieve a member of a superset of that category. The time taken to retrieve a category member was found to be strongly related to the Thorndike-Lorge frequency of the most frequent category member. Data support the concept of a semantic organization in which the category name can be located directly, rather than being accessible only via a search along a hierarchical path.—*Journal abstract*.

303. Morris, P. E. & Reid, R. L. (U. Exeter, England) **The repeated use of mnemonic imagery.** *Psychonomic Science*, 1970(Sep), Vol. 20(6), 337-338.—Hypothesized that the same mnemonic system can be used repeatedly without deterioration in performance through interference. 54 undergraduates used a "peg-word" system to memorize a single list of 10 nouns in different orders. No decline in performance was found. A control group improved on successive trials but at all times recalled less than the mnemonic group.—*Journal abstract*.

304. Nelson, Douglas L., Wheeler, Joseph, & Engel, Jane. (U. South Florida) **Stimulus meaningfulness and similarity, recall direction and rate of recall test.** *Psychonomic Science*, 1970(Sep), Vol. 20(6), 346-347.—In

a previous study, decreases in stimulus meaningfulness and similarity produced increases in the differences between forward and backward recall following paired-associate (PA) acquisition. Results from 160 undergraduates indicate that these relationships were not a result of the long recall test interval used. Although the overall level of recall was reduced under a faster test rate, the meaningfulness-similarity recall direction relationships were independent of test rate.—*Journal abstract.*

305. Postman, Leo & Parker, Janet F. (U. California, Berkeley) **Maintenance of first-list associations during transfer.** *American Journal of Psychology*, 1970(Jan), Vol. 83(2), 171-188.—Investigated the effects on transfer and retroactive inhibition of 1st-list recall during the test trials of 2nd-list learning (simultaneous method). In Exp. I this procedure was used with 16 undergraduates in each group under 4 paradigms of transfer: A-B, C-D; A-B, A-C; A-B, A-Br; and A-B, A-B. In Exp. II a direct comparison was made for 2 paradigms (C-D and A-C) between the simultaneous method and the conventional procedure with 16 undergraduates in each group. In the simultaneous condition the differences among paradigms in transfer learning paralleled those obtained under the successive treatment. The maintenance of 1st-list responses resulted in moderate retardation of transfer performance. Retroactive inhibition was reduced but not eliminated when the 1st list continued to be recalled in the transfer stage. In the simultaneous situation the amounts of retroactive inhibition for C-D and A-C did not differ reliably and appeared to reflect primarily a reduction in the availability of 1st-list responses. Progressive unlearning of 1st-list associations was in evidence only for A-Br. Mediated facilitation was observed under the A-B paradigm.—*Journal abstract.*

306. Puff, C. Richard. (Franklin & Marshall Coll.) **An investigation of two forms of organization in free recall.** *Journal of Verbal Learning & Verbal Behavior*, 1970(Dec), Vol. 9(6), 720-724.—Following multiple free-recall trials, the protocols for 15 undergraduates presented with a categorized (C) list were scored for both categorical clustering and intertrial (subjective) organization, while the data for 15 undergraduates given a noncategorized (NC) list were scored for just intertrial organization. Results indicate that organization in the form of broad conceptual grouping (clustering) was adopted more readily than fixed sequential ordering. Previous findings that the clustering with the C list did not influence the degree of fixed ordering were also replicated. Also, it was shown that percentage-of-maximum-possible scores are an adequate way of expressing the 2 forms of organization for comparison, while the standard observed-minus-expected scores are not as useful.—*Journal abstract.*

307. Robinson, John A. (U. Louisville) **Reply to Birnbaum.** *Psychonomic Science*, 1970(Nov), Vol. 21(4), 225.—Argues that the example presented by I. M. Birnbaum (see PA, Vol. 46:Issue 1) in criticism of an earlier experiment is not characteristic of the data in question. Original conclusions are defended.—S. Knapp.

308. Schmidt, Richard A. & Ascoli, Kenneth M. (U. Michigan) **Attention demand during storage of traces in motor short-term memory.** *Acta Psychologica, Amsterdam*, 1970(Dec), Vol. 34(4), 497-504.—Describes 2 experiments designed to test the hypothesis that attention demand during the storage of motor traces in motor short-term memory (STM) would cause a decrement in recall. 18 male and 6 female right-handed

graduate and undergraduate students served as Ss in both experiments. Attention demand was manipulated by having Ss rehearse consonant trigrams (Exp. I) or by counting forward by "1s" or backward by "3s" (Exp. II) during storage of traces from a positioning task. Although rehearsing trigrams failed to influence accuracy of recall, counting backward resulted in nearly twice the error as counting forward, indicating that not all of the proactive inhibition found in earlier work could be attributable to motor interference.—*Journal abstract.*

309. Schulman, Arthur I. & Lovelace, Eugene A. (U. Virginia) **Recognition memory for words presented at a slow or rapid rate.** *Psychonomic Science*, 1970(Oct), Vol. 21(2), 99-100.—Tested recognition in 80 undergraduates with lists of common and rare English words presented at 1 word/sec or 1 word/4.25 sec. It was found that fast presentation impairs subsequent recognition of both common and very rare words. This presentation rate, slow enough for accurate perception but probably too fast for much more elaborate information processing also sharply reduces the variability of recognition memory scores.—*Journal abstract.*

310. Shapiro, S. I. (U. Hawaii) **Serial organization and prior free recall.** *Canadian Journal of Psychology*, 1970(Apr), Vol. 24(2), 57-63.—Assessed serial recall and organization of a list after different levels of prior free-recall learning with the same list. Performance was expected to be impaired as a direct function of amount of free recall because of inappropriate organizational units formed during free recall. Recall on serial trials following 15 free-recall trials was inferior to 5 or 10 prior free-recall trials. 4 groups of 24 Ss each were tested. Serial organization on the 1st serial trial was inferior if prior free recall occurred, but did not vary with the amount of free recall. These results, and those of part-whole and whole-part free-recall transfer studies, were interpreted by a component analysis of free recall, including response learning/unlearning and organizational learning/unlearning. (16 ref.) (French summary)—*Journal abstract.*

311. Shapiro, S. I. (U. Hawaii) **The commonality of subjective organization in free recall.** *Psychonomic Science*, 1970(Oct), Vol. 21(2), 81-83.—Presents measures of bidirectional commonality and bidirectional ratio of commonality to assess the extent of inter-S agreement of subjective organization in free recall. Results of an experiment with 24 male and female undergraduates employing the commonality measure indicate that commonality increases across trials and is positively correlated with the amount of recall. However, the amount of commonality is relatively low. The low amounts of commonality were confirmed further by analyzing the data of 3 additional and independent studies of free recall. (18 ref.)—*Journal abstract.*

312. Shapiro, S. I. & Bell, Jerold A. (U. Hawaii) **Subjective organization and free recall: Performance of high, moderate, and low organizers.** *Psychonomic Science*, 1970(Oct), Vol. 21(2), 71-73.—Reports a study by E. C. Carterette and E. A. Coleman which found that, at least for high organizers, subjective organization appears to follow recall. Since such relationship seriously brings into question the hypothesis that memory is largely dependent upon subjective organization, a replication and extension of the experiment was undertaken. When 51 undergraduates were divided into high, moderate, and low organizers, superior recall performance was clearly associated with greater

organization. However, increases in organization for the low and moderate organizers were minimal, despite marked improvements in recall. The general problem raised by Carterette and Coleman about the adequacy of the organizational hypothesis to account for the free recall of lists of unrelated words is upheld.—*Journal abstract.*

313. Smith, Anderson D., D'Agostino, Paul R., & Reid, L. Starling. (U. Virginia) **Output interference in long-term memory.** *Canadian Journal of Psychology*, 1970(Apr), Vol. 24(2), 85-89.—Reports 2 experiments, with 70 and 140 undergraduates, concerning the role of output interference on the recall of organized material. Groups of Ss received blocked presentation of a 49-item list consisting of 7 items in each of 7 categories. At recall, the category name served as the retrieval cue. In Exp. I, a 20-sec recall interval was allowed for each category and 10 Ss were assigned to each group. In Exp. II, this interval was increased to 90 sec. and 20 Ss were assigned to each group. Results of both studies indicate that the number of words recalled from a category is dependent on the position of the category in the output sequence. In general, the earlier a category appears in the output sequence, the greater the number of words recalled from that category. (French summary)—*Journal abstract.*

314. Stelmach, George E. & Bruce, Jack R. (U. California, Santa Barbara) **Recall load in STM.** *Psychonomic Science*, 1970(Nov), Vol. 21(4), 205-207.—Examined recall load and difficulty of information processing in kinesthetic recall using a within-S design with 15 right-handed undergraduates. The multiple-recall task had larger absolute error compared to the single task; however, algebraic error revealed little differences. Absolute error analysis indicates that both retention interval conditions were significantly different from control. Difficulty of information reduction activity was not found to be a significant variable, and the Recall Load \times Interpolated Activity interaction failed significance. No evidence was found to suggest that relative difficulty between the motor and verbal task can explain the empirical differences between the 2 domains.—*Journal abstract.*

315. Stoff, David M. & Eagle, Morris N. (Yeshiva U.) **The relationship among reported strategies, presentation rate, and verbal ability and their effects on free recall learning.** *Journal of Experimental Psychology*, 1971(Mar), Vol. 87(3), 423-428.—Presented 20 tape-recorded words to 64 undergraduates in a free recall test of meaningful words with 1- and 3-sec presentation rates. Memorizing strategies were reported by Ss either before or after recall test. The time of report did not influence the effect on recall, demonstrating that reported strategies are not an artifact of recall performance. Organizational strategies resulted in significantly better recall than rehearsal only under the slower presentation rate. Organizational strategy Ss performed significantly better on the similarities subtest of the WAIS than rehearsal Ss. Findings are discussed in terms of the distinction between discovery and utilization of strategies, the nature of the operations involved in effective learning strategies, and the importance of the interaction among stimulus conditions, individual difference variables, and mediation in verbal learning. (25 ref.)—*Journal abstract.*

316. Strand, Bonnie Z. (Georgetown U.) **Further investigation of retroactive inhibition in categorized free recall.** *Journal of Experimental Psychology*, 1971(Feb), Vol. 87(2), 198-201.—Tested the theory that

the estimated category-recall score used in previous experiments on retroactive inhibition in free recall which have noted discrepancies between the predictions and the results for category recall for the paradigm in which the same (S) categories appear in both lists may not be adequate. Actual recall of category names was required for some groups, after 2 lists with either S or different (D) categories. Individual testing was given to each of the 16 undergraduates in each condition. For other conditions, the presence or absence of category names during word recall was manipulated. On the category-recall test, in accordance with theory, the D Group forgot more than the control condition, while there was no loss for the S Group. Results on the word-recall tests were also consistent with predictions.—*Journal abstract.*

317. Turnage, Thomas W. (U. Maryland) **Free recall of minimal serial lists.** *Journal of Experimental Psychology*, 1971(Mar), Vol. 87(3), 378-382.—Investigated free recall of subspan (2-noun) lists over a 45-sec retention interval. The recall lists involved all combinations of high- and low-meaningful nouns. Results, with 160 undergraduates, show that free recall of the subspan lists produced many of the effects found with free recall of supraspan lists including a recency effect that diminished with delayed recall. There were also indications that an item's frequency and serial position were complex predictors of probability of recall, interference effects, and recall strategies. Results are discussed in terms of single vs. dual processing in memory.—*Journal abstract.*

318. Underwood, Benton J., Zimmerman, Joel, & Freund, Joel S. (Northwestern U.) **Retention of frequency information with observations on recognition and recall.** *Journal of Experimental Psychology*, 1971(Feb), Vol. 87(2), 149-162.—Determined retention of frequency discriminations among words for 3 intervals (0, 1, and 7 days) and for presented frequencies of from 1-6. Comparative judgments and absolute judgments were used to measure frequency discrimination. 9 groups of 40 undergraduates each were used. All Ss were given a single long list of words with the varying frequencies occurring within the list. Free recall was also obtained; all intervals and all 3 types of retention tests were represented by independent groups. Results show (a) appreciable losses of frequency discriminations over time, losses which could not be accounted for by the hypothesis that situational frequency merges into background frequency; (b) very heavy forgetting as measured by free recall; and (c) a positive relationship between free recall of words and their apparent frequency. Results support the theory that a frequency discrimination is dominant in recognition memory.—*Journal abstract.*

319. Zytoske, Adrian E. (Emory U.) **The effects of category size and serial position within categories on recognition memory.** *Dissertation Abstracts International*, 1970(Nov), Vol. 31(5-B), 3041.

Short Term & Immediate Memory

320. Brodie, Delbert A. & Lippman, Louis G. (Western Washington State Coll.) **Effects of shifts in visual, semantic, and acoustic-semantic stimulus attributes in STM tasks.** *Psychonomic Science*, 1970(Sep), Vol. 20(6), 335-337. 4 groups of 20 undergraduates recalled triads of spelled-out numbers for 3 trials. The type of material presented on the 4th trial was the same for the

control (C) group but differed either visually (V), semantically (S), or acoustically and semantically (AS) from prior material for 3 experimental groups. Recall for all groups decreased over the 1st 3 trials. Vocal and written recall on the 4th trial for Groups V and SA, but only vocal recall of Group S, was superior to that of Group C. In contrast to the recent emphasis upon acoustic storage, results indicate that short-term memory of verbal material entails both an auditory and visual process. Results are discussed in terms of extensions of the interference-encoding hypothesis.—*Journal abstract.*

321. Brodie, Delbert A. & Lippman, Louis G. (Western Washington State Coll.) **Symbolic and size shifts in short-term memory tasks.** *Psychonomic Science*, 1970(Sep), Vol. 20(6), 361-362.—Tested 5 groups of 30 undergraduates each for recall of triads of spelled-out numbers (SON) or arabic numbers (AN) for 4 trials in order to examine the effects of a shift in either symbolic presentation or physical size. Recall was facilitated by size and symbolic changes, overall recall of AN was superior to that of SON, and idiosyncratic item effects were observed. The relationship between these results and isolation effects is discussed.—*Journal abstract.*

322. Campos, Leonel. (U. Manila, Philippines) **Is primary memory the source of the recency effect in short-term serial recall?** *Philippine Journal of Psychology*, 1969(Dec), Vol. 2(2), 57-59.—Explored the fate of the recency effect with delayed, reversed short-term serial recall. 33 Filipino undergraduates recalled 3 lists with 10 English words each and with an interval of delay—0, 10, or 20 sec. The outcome supports the notion that in short-term memory the probability of recall of an item within a series depends more on the order of arrival than on the order of retrieval of the items, and that primary memory is the source of the recency effect.—*Journal abstract.*

323. Cimbalo, Richard S. & Pelonero, Kathleen C. (Rosary Hill Coll.) **The isolation effect and mechanisms in short- and long-term memory.** *Psychonomic Science*, 1970(Oct), Vol. 21(2), 69-70.—Manipulated the duration of tachistoscopic exposure (2.5, 10, and 20 sec.) for 10-item lists in an attempt to emphasize either short-term memory (STM) or long-term memory (LTM). A Duration \times Isolation interaction was hypothesized such that overall performance for isolated and unisolated lists would not differ in STM but that the overall performance for isolated lists would be superior to unisolated lists in LTM. Results with 21 female undergraduates did not support the hypothesis. Performance for isolated lists was found to be superior for all 3 duration conditions. This result is explained in terms of an effective shortening of the encoded list caused by the presence of an isolated item.—*Journal abstract.*

324. Corballis, Michael C. & Raeburn, Barbara J. (McGill U., Montreal, Quebec, Canada) **Recall strategies in three-channel immediate memory.** *Canadian Journal of Psychology*, 1970(Apr), Vol. 24(2), 109-116.—Digits were spoken through earphones via 3 simultaneous auditory "channels," created by having 1 digit spoken to the left ear only, another to the right ear only, and a third (middle channel) to both ears at once. Also, each channel was spoken by a different voice, a woman's in the middle, and different men's voices to left and right. 18 right-handed and 18 left-handed Ss heard a series of 2 such triplets, with onsets of 1 sec. apart. Ss instructed to report the digits channel by channel recalled as many digits as those instructed to report them

triplet by triplet, but Ss who were permitted free recall chose the triplet-by-triplet strategy more often than the channel-by-channel one. (French summary)—*Journal abstract.*

325. Craft, John L. & Hinrichs, James V. (U. Iowa) **Short-term retention of simple motor responses: Similarity of prior and succeeding responses.** *Journal of Experimental Psychology*, 1971(Mar), Vol. 87(3), 297-302.—Investigated interference effects on the recall accuracy of a standard motor response as a function of the similarity of prior and interpolated responses, in 3 experiments with 54 undergraduates. S executed 2 blind linear movements of controlled length and recalled 1 of them. In Exp. I and II, S was informed which movement to recall after both had been executed. In Exp. III, S was informed which movement was to be repeated before either was executed. Standard recall error was observed to be increasingly in the direction of the interfering movement paired with the standard, and pre- and postcuing of the recall requirement did not produce differential magnitude or patterns of response error. Results are consistent with the hypothesis of memory trace interaction proposed by R. L. Pepper and L. M. Herman (see PA, Vol. 44:4545).—*Journal abstract.*

326. Daoust, Donald L. (George Washington U.) **An investigation of grouping in serial order short-term retention.** *Dissertation Abstracts International*, 1970(Oct), Vol. 31(4-B), 2300-2301.

327. Dey, Mukul K. (Jersey City State Coll.) **Reminiscence in paired-associate learning.** *British Journal of Psychology*, 1971(Feb), Vol. 62(1), 41-51.—Investigated whether sufficient intralist stimulus similarity (ISS) is an essential condition for reminiscence to appear in paired-associate (PA) learning. 72 undergraduates served as Ss. Using lists of 6 tone-word pairs, 2 degrees of ISS were factorially combined with 0-, 2-, and 4-min rest pauses interpolated after the attainment of criterion 4/6. Recalls on the 1st 2 posttest trials reflected a depressive rather than facilitative influence on rest pause. Analyses of posttest trial to criterion 6/6 revealed that significant facilitation occurred only when the length of rest pause was 2 min. and stimulus similarity was high. This finding indicates that a reminiscence effect resembling the L. B. Ward and C. I. Hovland phenomenon is obtainable in PA learning provided there is high enough similarity among stimuli. Results appear to be best explained by a theory of PA learning which postulates a temporally labile competition-generated inhibitory potential. (48 ref.)—*Journal abstract.*

328. Dornbush, Rhea L. (New York Medical Coll., N.Y.) **Delay of auditory input in "simultaneous" auditory and visual short-term memory.** *Perception & Psychophysics*, 1971(Jan), Vol. 9(1-B), 97-98.—Attempted to facilitate visual recall when material is presented under bisensory simultaneous conditions (i.e., visual and auditory stimuli presented together), by delaying auditory material up to 1/4 sec. relative to the onset of the visual material. Visual recall for 174 undergraduates, however, remained stable across the auditory delays, suggesting a limitation in the visual system beyond that associated with the simultaneous occurrence of auditory material.—*Journal abstract.*

329. Elmes, David G. & Wilkinson, William C. (Washington & Lee U.) **Cued forgetting in free recall: Grouping on the basis of relevance and category membership.** *Journal of Experimental Psychology*, 1971(Mar), Vol. 87(3), 438-440.—Presented categorized

word lists for free recall to 12 Ss in Exp. I. In Exp. II, with 12 Ss, both categorized and uncategorized items appeared in the lists. Ss were cued to forget $\frac{1}{2}$ the items in some categories and $\frac{1}{2}$ the uncategorized words. Irrelevant or to-be-forgotten words were not recalled as well as relevant items. Recall of relevant items categorically related to irrelevant items was poorer than recall of other categorized items. Irrelevant items were retrieved adjacent to categorically related relevant items and other irrelevant words with about equal frequency. Uncategorized relevant items tended to appear next to each other in recall. It is concluded that irrelevant information is stored by labeling items within a category as relevant or irrelevant, and by grouping on the basis of relevance.—*Journal abstract.*

330. Ernest, Carole H. & Paivio, Allan. (U. Western Ontario, London, Canada) **Imagery and sex differences in incidental recall.** *British Journal of Psychology*, 1971(Feb), Vol. 62(1), 67-72.—Tested 36 male and 75 female undergraduates who differed on measures of imagery ability for incidental recall in 2 experiments involving pictures and words as stimuli. In Exp. 1 high-imagery males surpassed their low-imagery counterparts in intentional free recall of words, but the reverse relation occurred with females. No relation was obtained between imagery ability and incidental recall for stimulus color. However, the colors were recalled better when associated with pictures rather than words as stimuli, suggesting an effect of stimulus concreteness on visual memory. The orientating task in Exp. II was item recognition. High-imagery Ss were more accurate than low-imagery in the recognition task, and high-imagery females (but not males) surpassed their low-imagery counterparts in incidental recall of the stimuli. Results provide further evidence for the functional significance of imagery in tasks involving a memory component.—*Journal abstract.*

331. Fisher, Dennis F. & Karsh, Robert. (Aberdeen Research & Development Center, Human Engineering Lab., Aberdeen Proving Ground, Md.) **Modality effects and storage in sequential short-term memory.** *Journal of Experimental Psychology*, 1971(Mar), Vol. 87(3), 410-414.—Notes that previous studies have not been effective in minimizing the temporal dependencies which have favored auditory over visual performance in short-term memory. 2 experiments were conducted using the keeping-track task which has been shown to place importance upon spatial relationships during encoding and storage. Exp. 1, with 18 undergraduates, resulted in fewer errors being made during the auditory presentations, suggesting the possibility of differences in the encoding task for each mode. Exp. 2, with 18 undergraduates, attempted to equate the encoding tasks and resulted in the same level of performance for each mode. Results are interpreted as giving support to the "spatial window" model. Both modes were found to be capable of spatial encoding and storage.—*Journal abstract.*

332. Hinrichs, James V. & McKoon, Gail. (U. Iowa) **Order and number requirements in immediate serial recall.** *Journal of Experimental Psychology*, 1971(Feb), Vol. 87(2), 215-219.—8 groups of 16 undergraduates recalled 10-number sequences in which 2 order requirements and 1 response number requirement were imposed. Both order requirements, production order and final protocol order, significantly influenced retention and interacted with primacy and recency effects within the recall sequences. Restriction of the number of

responses emitted influenced only the level of performance and did not interact with any other variable. Differences in ordered retention were attributed to differential availability of recency items in recall.—*Journal abstract.*

333. Klein, Helen G. (U. Pittsburgh) **The temporal development of meaning from very short-term memory.** *Dissertation Abstracts International*, 1970(Oct), Vol. 31(4-B), 2313-2314.

334. Krueger, Lester E. (City Coll., City U. New York) **Effect of direction of sequential presentation and redundancy on short-term recognition memory.** *Perception & Psychophysics*, 1971(Jan), Vol. 9(1-B), 121-124.—Tested short-term recognition memory by presenting 6 letters, 1 after the other, followed by a target letter to 20 undergraduates in each of 3 experiments, and having S indicate whether or not the target matched 1 of the 6 letters. Recognition memory for a letter was better when it was embedded in a 6-letter word, rather than a nonword, and when it was included in a sequence presented left-to-right, rather than right-to-left. Reducing the presentation rate from 4/sec to 2.5/sec largely eliminated the left-to-right effect. The effect of direction of presentation was (a) greater for redundant than for nonredundant sequences, (b) greater for Ss who more frequently formed a word out of the sequence, (c) no greater for words than nonwords, and (d) no greater for letter than for line-figure sequences. Findings suggest that the left-to-right effect depends as much, or more, on peripheral processes (e.g., eye movements) as on central processes (e.g., reading).—*Journal abstract.*

335. Madigna, Stephen A. (U. Southern California) **Modality and recall order interactions in short-term memory for serial order.** *Journal of Experimental Psychology*, 1971(Feb), Vol. 87(2), 295-297.—Forward serial recall of lists of 8 words showed marked modality effects, with auditory and visual inputs recalled equally well for initial serial positions, but with a much more extensive recency effect produced by auditory presentation. These modality differences were eliminated in backward recall. 16 Ss were tested. In terms of numbers of items recalled in correct positions, backward recall was noticeably superior to forward recall for visual presentation; for auditory presentation, recall order had negligible effects. The possible role of sensory storage mechanisms in the production of these effects is discussed.—*Journal abstract.*

336. McLeod, P. D., Williams, C. E., & Broadbent, D. E. (Medical Research Council, Applied Psychology Unit, Cambridge, England) **Free recall with assistance from one and from two retrieval cues.** *British Journal of Psychology*, 1971(Feb), Vol. 62(1), 59-65.—Presented a list of 25 words for free recall to 34 undergraduates. Hints were later given for unrecalled words by presenting 1st 1 and then a 2nd cue word associated with the unrecalled words. Earlier results by E. Tulving and S. Osler (see PA, Vol. 42:16615) had shown that 1 cue assists recall but had shown no benefit from the 2nd cue; in their task, however, the associations were established with the experiment. In the present results, the 2nd cue did produce a further increment in recall; furthermore, the increment in recall was greater than that predicted on the assumption that there was no interaction between the 2 cues. The 1st cue had produced some effect even when it did not give full recall.—*Journal abstract.*

337. Miller, Laurence. (Western Washington State Coll.) **The effect of duration of item exposure on**

recall in a short-term memory paradigm. *Psychonomic Science*, 1970(Oct), Vol. 21(2), 123-124.—Tested 288 undergraduates for recall of 6 consonant trigrams at retention intervals of 0, 3, and 18 sec. with a 2000-, 500-, or 200-msec duration of item exposure. As duration was reduced, retention at 3- and 18-sec within- and between-exposure durations declined for all items, and the interaction between length of retention interval and number of items was significantly reduced for the initial and middle items. Results are interpreted in terms of increased proactive interference as item exposure is reduced.—*Journal abstract*.

338. Morganstein, Stanley. (U. Massachusetts) **The effect of encoding, retention interval and serial position on reconstruction accuracy and latency.** *Dissertation Abstracts International*, 1970(Oct), Vol. 31(4-B), 2320.

339. Norman, Carolyn P. & Hall, Alfred E. (Wooster Coll.) **Effect of learning on false recognitions.** *Journal of Experimental Psychology*, 1971(Mar), Vol. 87(3), 326-330.—Conducted 2 experiments to study the effects of laboratory-induced learning upon false recognition of words as repetitions, using the procedure of B. J. Underwood (see PA, Vol. 39:11459). In Exp. I and II with 40 undergraduates and 100 high school and college summer students, the effect of laboratory-induced learning on false recognitions was demonstrated when the stimulus words were presented at least 3 times. In Exp. II, false recognition of words as repetitions, based on a mediated chain, was not demonstrated.—*Journal abstract*.

340. Parkinson, Stanley R., Parks, Theodore E., & Kroll, Neal E. (U. California, Davis) **Visual and auditory short-term memory: The effects of phonemically similar auditory shadow material during the retention interval.** *Journal of Experimental Psychology*, 1971(Feb), Vol. 87(2), 274-280.—Investigated via a series of 3 experiments human ability to retain a single letter of the alphabet (presented either visually or aurally) while concurrently shadowing (repeating aloud) a series of aurally presented letters. 12 naive undergraduates were used in each experiment. The retention of auditory letters was adversely affected when the shadow list contained phonemically similar letters. However, retention of visually presented letters suffered when subsequent shadow letters all contained the root vowel, *e*, whether or not the memory letter itself had that root vowel. Thus, the hypothesis that visual presentation led to only an auditory form of storage is not supported. Alternatively, it is concluded that visual stimuli may lead to retention of the appearance of, rather than the name of, each letter and that these memories may persist for at least several sec.—*Journal abstract*.

341. Pollio, Howard R. & Foote, Russell. (U. Tennessee) **Memory as a reconstructive process.** *British Journal of Psychology*, 1971(Feb), Vol. 62(1), 53-58.—Investigated the effects of S-defined structure on the free recall of verbal material. 4 groups of 15 undergraduates each sorted 4 different word lists into individually defined categories. Immediately after sorting, Ss were unexpectedly asked for a free recall of these words. All Ss' recall outputs were organized in concord with their sorting categories. Over all Ss a number of common categories emerged. In addition, recall categories were found to be temporally distinct in individual recall records. Results support the view that memory is a reconstructive rather than an associative

process when task constraints do not preclude the S from using S-defined organizational factors.—*Journal abstract*.

344. Schmidt, Richard A. & Ascoli, Kenneth M. (U. Michigan) **Intertrial intervals and motor short-term memory.** *Research Quarterly*, 1970(Oct), Vol. 41(3), 432-438.—Earlier work which showed no proactive inhibition (PI) effects in motor short-term memory (STM) may have failed to do so because the long ITIs used may have allowed the traces from previous positions to weaken and become ineffective in producing PI. The present investigation determined whether the ITI was a factor in PI. 7 female and 33 male right-handed undergraduates and graduates served as Ss. The task involved presentation and recall (after a 10-sec retention interval) of positions along a trackway, each S having 10 different positions on each of 10 trials. ITIs were either 10 or 90 sec. for 2 groups of 20 Ss each. No PI occurred and ITI was not a variable in PI, which failed to support the view that motor and verbal STM may be similar systems.—*Journal abstract*.

345. Schwarz, M. & Bryden, M. P. (St. Francis Xavier U., Antigonish, Nova Scotia, Canada) **Coding factors in the learning of repeated digit sequences.** *Journal of Experimental Psychology*, 1971(Mar), Vol. 87(3), 331-334.—Presented 9-number sequences aurally to 60 undergraduates in the guise of an experiment on practice effects on digit span. A single critical sequence was repeated on every 3rd trial. 1 or 2 numbers at the beginning or end of the repeating series were changed on each trial for 7 repetitions. Ss were then given 5 test trials in which the repeating series remained constant. Changing numbers at the end of the sequence, or 1 number at the beginning of the sequence, did not disrupt learning of the repeating sequence. Changing 2 numbers at the beginning of the repeating sequence reduced performance to the same level as that of Ss who had not heard the repeating series at all prior to the test trials. Results suggest that a number sequence is coded as familiar or unfamiliar largely on the basis of the 1st block of numbers.—*Journal abstract*.

347. Tell, Phillip M. & Voss, Brendan X. (Florida Technological U.) **The influence of vocalization activity on short-term recall.** *Psychonomic Science*, 1970(Oct), Vol. 21(2), 120-121.—Utilized the Peterson distractor technique to investigate the effect of vocalization activity on short-term recall. 60 undergraduates voiced or silently read to-be-remembered consonant trigrams and were tested for recall at retention intervals up to 12.6 sec. It was found that the auditory input resulting from vocalization activity was a facilitating source of information in short-term recall when compared with silent reading of trigrams. Findings further indicate that vocalization activity has its most beneficial effects at the shorter retention intervals.—*Journal abstract*.

348. Udolf, Roy. (Hofstra U.) **The verbal loop**

hypothesis as a predictor of individual differences in short-term recall of tachistoscopically presented binary numbers. *Psychonomic Science*, 1970(Nov), Vol. 21(4), 245-247. Investigated the theory of the verbal loop hypothesis to predict individual differences in the recall ability of 51 evening college students presented with 20 arrays of 8-digit binary numbers at exposure times of .5 sec. The independent variable was the binary array, and the 2 dependent variables to be correlated were verbalization length, measured in units of words, and stimulus difficulty, measured in units of number of errors. The finding by M. Glanzer and W. H. Clark (see PA, Vol. 38 7391) of a high negative correlation between stimulus accuracy and mean verbalization length was replicated here by obtaining a high positive correlation between stimulus difficulty and mean stimulus verbalization length. However, there was no relationship found between the characteristic verbalization length of an S and his ability on the experimental task as measured by his total number of errors. Results suggest that the verbal loop hypothesis may require modification and further testing. *Journal abstract.*

THINKING

350. Beller, Henry K. (State University Coll. New York, Brockport) Priming Effects of advance information on matching. *Journal of Experimental Psychology*, 1971(Feb), Vol. 87, Pt. 1, 121-125. Used a modification of M. J. Posner and R. J. Mitchell's paradigm to clarify the role of advance information on matching. 6 Ss were shown, in advance, 1 of a pair of items to be matched. This advance information (priming) directed R1 to physical matches even when the cue of this prime was a linguistic Prime. Facilitated matches took less time than physical matches but only when prime-cue matching was consistent. Results are interpreted as suggesting that priming affects information processing at 2 levels, stimulus encoding and memory access. *Journal abstract.*

351. Bersted, Chris T., & Evans, Selby H. (Southwest Missouri State Coll.) Effects of adherence to generation rules on conceptual judgments. *Psychonomic Science*, 1970(Nov), Vol. 21(4), 211-212. Presented 20 trials on a simultaneous same-different similarity-discrimination task with hierarchical stimuli containing different amounts of difference in 2 processing points in 20 intercorrelations. Stimulus judgments and number of same-different responses were found to be a positive function of amount of difference in a generation rule. Conversely, the response was positive to a lower amount of higher similarity ratings as similarity increased in different control trials. It is suggested that Ss are not primarily concerned to detect primeness but that some attributes are not well learned, and are being separately encoded. *Journal abstract.*

352. Devlin, Dennis, & Deffenbacher, Kenneth A. (Nebraska, Omaha) Effects of proportion of positive instances and degree of restriction on the induction of a principle. *Psychonomic Science*, 1970(Dec), Vol. 21(5), 29-30. Assigned 30 undergraduates to 2 treatment groups. Ss attempted to discover a principle by which numbers and letters were paired. Ss varied on 2

dimensions: proportion of positive instances sampled and degree of restriction in selecting instances for test. Ss who sampled a higher proportion of positive instances were superior to those sampling a lower proportion. Ss who were unrestricted in their selection of instances because they sampled a higher proportion of positive instances performed better than Ss who were restricted and sampled a lower proportion. Finally when both restricted and unrestricted groups were equated for proportion of positive instances sampled, performance was similar. *Journal abstract.*

354. Jansen, Jan P., & Wittmer, Rudolf. (Tübingen U. Inst. of Psychology, W. Germany) Der Einfluss verschiedener Vortätigkeiten und verschiedener Bearbeitungsreihenfolgen auf die Leistungen bei Konzentrationsproben. [The influence of various activities and of test-sequence on the achievement in concentration tests]. *Psychologische Beiträge*, 1970, Vol. 12(1), 44-49. Tested the hypothesis of a specific stimulation of the readiness to concentrate by means of a balanced variety of various experimental activities. Attempts were then to control the influences of different activities and sequences in which the tests were administered. Data indicate that both factors influenced achievement behavior in a statistically significant manner. Results point out the necessity for standardized testing situations. *English summary.*

355. Kalkstein, Hermann. (Inst. for Scientific Form, Göttingen, W. Germany) Change in degree of interference in a Stroop-like test (SWT) when the incongruent combinations are mixed with congruent ones: A reply to Prof. G. J. W. Smith. *Psychologische Beiträge*, 1970, Vol. 12(1), 51-56. The time time required for naming the color of clearly worded combinations in the Stroop-like test published by Smith and Rupp results in decrease as the number of congruent combinations increases. G. J. W. Smith (see PA, Vol. 45 Issue 6) argues that "the results cannot be interpreted to mean that the degree of interference between sound and image decreased in the incongruent combinations. Such an interpretation, however, was not given. It may be, as Smith likes to assume, that the more congruent combinations that are presented in a test the more interference interference in the incongruent combinations follows from it too. An adequate testing of this hypothesis of course would require RBT for the individual naming combinations in a changing task, both Kalkstein and professor Kalkstein does not concern the core of his dissertation. The essential result of this dissertation has to be understood as a critique "of the strongly increasing interest in problems of word-color interference." *Journal summary.*

356. Kuzilevsk, Jozef. (Warsaw Inst. of Psychology, Poland) Psychological characteristics of probabilistic inference. In *Psychological Foundations of Learning*, Vol. 34-1, 435-449. Compared the behavior of Ss during the solution of probabilistic inference tasks with Heuristics, which represent an optimal model for the change in joint probability of the outcomes under the influence of new information. Results of laboratory studies have shown that in solving probabilistic tasks Ss are less sensitive to a change in joint probability of events, hypothesis, i.e., they are conservative. In wide

inferential tasks there is a tendency to overestimate the probability of the system of modal hypotheses, i.e. Ss are radical. The conservatism and radicalism reflect a limitation on human ability to process and store information.—*Journal abstract.*

357. Moore, Samuel F., Gleser, Goldine C., & Warm, Joel S. (Community Mental Health Clinic, Lawrenceburg, Ind.) **Cognitive style in the organization and articulation of ambiguous stimuli.** *Psychonomic Science*, 1970(Nov), Vol. 21(4), 243-244.—Assessed the relation between the abilities to organize and articulate ambiguous stimuli and the global-analytic continuum of cognitive style postulated by H. A. Witkin in his theory of psychological differentiation. Thirty-five male undergraduates served in the study. Cognitive style was measured by the Rod and Frame Test; the Obscure Figures Test (OFT) measured organizing or structuring ability. Articulation was operationally defined in terms of memory for the OFT figures as indexed by recognition and identification measures. Consistent with predictions from Witkin's theory, significant correlations were obtained between cognitive style and the abilities of organization and articulation.—*Journal abstract.*

358. Oleson, D. S. & Zubek, John P. (U. Manitoba, Winnipeg, Canada) **Effect of one day of sensory deprivation on a battery of open-ended cognitive tests.** *Perceptual & Motor Skills*, 1970(Dec), Vol. 31(3), 919-923.—Tested the hypothesis that performance on unstructured or open-ended cognitive tests will be impaired by sensory deprivation (SD). The Guilford Battery of Creative Thinking, consisting of 10 subtests, was administered to a group of 18 male undergraduates before and after 1 day of SD. Results show that, relative to a group of 18 controls, only the performance on associational fluency was significantly impaired. 3 possible explanations are offered for these essentially negative results.—*Journal abstract.*

363. Smedslund, Jan. (U. Oslo Inst. of Psychology, Norway) **Circular relation between understanding and logic.** *Scandinavian Journal of Psychology*, 1970, Vol. 11(4), 217-219.—Reports that procedures for determining logicality presuppose understanding and procedures for determining understanding presuppose logic. One can escape from this circle only by presupposing logicality, in agreement with common sense thinking. Understanding can then be studied as an empirical variable. Traditional research has been based on the opposite solution: logicality is treated as an empirical variable, understanding is implicitly presupposed; hence results are obtained which do not make sense.—*Journal abstract.*

364. Smith, Gudmund J. (Lund U., Sweden) **Change in degree of interference in a Stroop-like test (SWT) when the incongruent combinations are mixed with congruent ones.** *Psychologische Forschung*, 1970, Vol. 34(1), 95-96.—Results published by Kalkofen show, contrary to his own conclusions, that interference in a Stroop-like test increases when congruent combinations are added to the incongruent ones. Kalkofen's experiment seems to show that he succeeded in accentuating the S's experience of conflict when confronting the incongruent combinations. It is irrelevant in this context that the reduction in number of conflicting items causes a small decrease in overall reading times.—*Journal summary.*

365. Snapper, Kurt J. & Fryback, Dennis G. (U. Michigan, Inst. of Science & Technology) **Inferences based on unreliable reports.** *Journal of Experimental Psychology*, 1971(Mar), Vol. 87(3), 401-404.—Studied the inferences of 25 male undergraduates based on partially reliable reports. Inferences may be based on direct observation of events or on reports from indirect sources about the occurrence of events. Direct observation will be more diagnostic than a report if the source of the report is not completely reliable. It was found that Ss responded to reduced report reliability by using a formally inappropriate rule that led to overestimation of the diagnostic impact of a report.—*Journal abstract.*

367. Wortman, Paul M. (Duke U.) **Cognitive utilization of probabilistic cues.** *Behavioral Science*, 1970(Jul), Vol. 15(4), 329-336.—Describes a laboratory experiment on a classificatory process similar to medical diagnosis. 10 undergraduates learned the names and descriptions of 16 objects where the cues comprising these descriptions were probabilistic in nature. Ss then solved a number of object identification problems consisting of the presentation of a single cue, followed by a sequence of yes-no questions about the presence or absence of other cues, and terminating with the identification of the object. Results are interpreted as supporting a serial hypothesis-testing model and reveal how such hypotheses are generated and confirmed. The study is viewed as a necessary step toward the creation of a computer model of medical diagnosis. The model is briefly described.—*Journal abstract.*

Problem Solving

368. Duncan, Carl P. (Northwestern U.) **The effect of the shape of distribution of response strength on guessing errors in problem solving.** *American Journal*

of *Psychology*, 1970(Dec), Vol. 83(4), 535-543.—270 undergraduates were given problems each consisting of a stimulus word with its 5, 7, or 9 strongest word associates. Ss attempted to guess the middle-strength (target) associate. Since the hierarchy of strength between a stimulus and its associate responses is such that differences in strength among associates become progressively smaller as strength between stimulus and response decreases, associates weaker than the target associate are more similar in strength to the target than are associates stronger than the target. It was, therefore, expected that in trying to guess the target associate, more errors would be made to weaker than to stronger associates. This was found in all conditions. It appeared that the farther removed in strength—whether stronger or weaker—an associate was from the target associate, the less it was interfering. Giving the Ss a cue to associates stronger or weaker than the target word had some effect on, but in no way eliminated, the strong tendency to make more errors on weaker associates.—*Journal abstract*.

369. Seggie, J. L. (U. New England, Armidale, New South Wales, Australia) **Variables involved in confirming the consistency of a learned concept.** *Australian Journal of Psychology*, 1970(Dec), Vol. 22(3), 225-235.—Examined the reluctance of Ss to use indirect procedures in problem solving. 125 National Service recruits with IQs over 110 were studied in a concept learning experiment with 2 different concepts, 2 methods of instruction, and 3 learning methods. It was found that the greater the Ss' knowledge of the relationship between individual stimuli and classification the greater was the tendency to utilize the logical inverse. It was also found that if the Ss were not familiar with the general type of concept to be learned there was a significantly greater tendency to confirm the learned concept through the inverse. There was also a tendency for Ss learning a conditional concept to utilize the inverse to a greater degree when compared to Ss learning a conjunctive concept. It is concluded that Ss will use complex reasoning processes and that this depends on experimental methods.—*Journal abstract*.

372. Chlebek, Judith & Dominowski, Roger L. (U. Illinois, Chicago) **The effect of practice on utilization of information from positive and negative instances in identifying disjunctive concepts.** *Canadian Journal of Psychology*, 1970(Apr), Vol. 24(2), 64-69.—Previous research by V. Freiberger and E. Tulving has shown that positive instances are used more efficiently than negative instances by naïve Ss attempting to solve conjunctive concept problems, and that this difference diminishes with practice. The present study examined practice effects on the identification of disjunctive concepts with either positive or negative instances presented to 60 undergraduates. Results are the opposite of those of Freiberger and Tulving, with Ss who were shown only

negative instances having systematically lower solution times than those shown only positive instances, and with the difference diminishing with practice. Data were interpreted in terms of the relative efficiency of strategies appropriate to the 2 types of presentation. (French summary)—*Journal abstract*.

373. Fishbein, Harold D., Haygood, Robert C., & Frieson, Dixie. (U. Cincinnati) **Relevant and irrelevant saliency in concept learning.** *American Journal of Psychology*, 1970(Dec), Vol. 83(4), 544-553.—Reports 2 concept-learning experiments. Exp. I, with 72 undergraduates, compared performance under 3 stimulus configurations: (a) with the 2 relevant dimensions highly salient, (b) with 2 irrelevant dimensions highly salient, and (c) with no highly salient dimensions. Performance was best under a, next best under b, and poorest under c. Exp. II, with 64 undergraduates, explored several possible explanations of these results, which are contrary to existing ideas of the effects of irrelevant saliency. Results suggest that the presence of highly salient irrelevant dimensions improved performance because Ss examined them in the early trials of the experiment and then could permanently eliminate them.—*Journal abstract*.

377. Peters, Kenneth G. & Denny, J. Peter. (U. Western Ontario, London, Canada) **Labeling and memory effects on categorizing and hypothesizing behavior for biconditional and conditional conceptual rules.** *Journal of Experimental Psychology*, 1971(Feb), Vol. 87(2), 229-233.—Differences in difficulty of learning conceptual rules have been explained within L. E. Bourne's truth-table strategy theory by the naturalness-unnaturalness of various assignments of instance classes to response categories. However, since this factor cannot explain why conditional rules are learned more easily than biconditional rules, 2 other factors were tested. 56 undergraduates were assigned to 1 of 8 treatment conditions. Results show that when Ss were encouraged by neutral labeling of response categories (a) to learn the rule for both positive and negative categories; and (b) to assign to the negative category only 1 instance class for the conditional rule compared to 2 for the biconditional, they learned the conditional rule more proficiently.

However, when Ss were constrained by positive-negative labeling (a) to learn the rule for the positive category; and (b) to assign to the positive category only 2 instance classes for the biconditional rule compared to 3 for the conditional, Ss learned the biconditional more proficiently.—*Journal abstract.*

378. Shor, Ronald E. (U. New Hampshire) Identifying color concepts from pure and compounded symbolic representations: A broad extrapolation from the logic of the Stroop Color-Word Test. *International Journal of Symbolic*, 1970(Aug), Vol. 2(1), 29-36.—An analysis was made in a sample of 30 Ss of compounded symbol color-word phenomena using a standardized method developed as a broad extrapolation from the logic of the Stroop test. Comparisons were made between different numbers and groups of response alternatives. The interference effect was dimensionalized to include conditions of no mismatching and semimismatching. Equal attention was given to the effect of colors on words as of words on colors. A set of hypotheses was confirmed and further investigations were indicated.—*Journal abstract.*

DECISION & CHOICE BEHAVIOR

379. Bríháček, Václav. (Charles U., Prague, Czechoslovakia) Use of subjective probability in decision making. *Acta Psychologica, Amsterdam*, 1970(Dec), Vol. 34(2-3), 241-253. Discusses general problems concerning theoretical models of decision making. The experimental situations (on the basis of the quantity of information or experience) are divided into 3 categories: (a) exactly known objective probability of individual events, (b) objective probability approximately estimated, and (c) completely uncertain situation without the possibility of determining objective probability. The main research problems are considered to be: (a) extrapolation of verified findings (from the viewpoints of experimental methods used, experimental Ss, and utility of alternatives); (b) criteria of correct decisions (e.g., adequacy of the decision made, latency time, and subjective confidence of correctness); (c) the role of personality characteristics in decision making; and (d) comparative research of various experimental conditions. (43 ref.)—*Journal abstract.*

380. Buriach, Matthias. (Hamburg, 2nd Medical Clinic, W. Germany) An attempt to demonstrate utility of gambling. *Acta Psychologica, Amsterdam*, 1970(Dec), Vol. 34(2-3), 367-374. Compared "male and female undergraduate students for gambles with predictions of these students based on Ss estimates for the prizes of the gambles, and the SEU-model, which does not allow for utility of gambling (UG). Since the gambles had only 2 possible outcomes expected utility, if there is no matter how Sa perceived the probabilities in the gambles. Under these conditions Ss showed higher criteria for gambles than could be explained by the classical SEU model. The concept of positive UG is not cogent, however, since it had been impossible to match the 2 prizes of each gamble sufficiently close to unity. Some possible refinements are discussed which could be used in future studies.—*Journal abstract.*

381. Cohen, John & Whinston, Tom. (Manchester, England) Information of uncertainty: Four aspects of subjects' information and uncertainty. *Journal of Experimental Psychology: Human Perception and Performance*, 1970(Jul), Vol. 6(3), 188-196. By

choosing a number on a 0-100 certainty scale, where 0 was completely uncertain and 100 was absolutely certain, 72 females were asked to indicate their degrees of certainty that: (a) they had picked a blue or yellow ball from an urn containing 1024 tickets, (b) 1 or more balls they had thrown added to a particular sum, (c) a roulette ball had fallen into a red or black space, and (d) their answers yes and no to a series of questions were correct. Actual probabilities of correct response were converted mathematically into information "bits." Mean subjective uncertainty judgments on all the tasks formed a straight line when plotted as a function of log₁₀ "bits," forming a relationship which follows Weber's law.—*R. E. Smith.*

382. Cruse, Donna; Gambino, Blaise, & Myers, Jennifer L. (U. Massachusetts) Two-choice discrimination with alternating trial types. *Psychonomic Science*, 1970(Sep), Vol. 20(6), 345-346. Required 120 Ss to predict what of 2 events would occur on each of 510 trials. 2 signals to respond were alternated, and different events probabilities were associated with each signal. Combinations of the 2 event probabilities were varied over groups. Contrary to A. I. Brody's (see PA, Vol. 33 9785) earlier finding, response probability to 1 signal was influenced by the event probability to the other signal, as well as by the immediately preceding response and event occurrence.—*Journal abstract.*

383. De Leede, E. & Koerts, J. (Interfaculty for Graduate Studies in Management, Rotterdam, Netherlands) Economics and the probability concept. *Acta Psychologica, Amsterdam*, 1970(Dec), Vol. 34(2-3), 265-272.—Discusses the attitude of economists towards several interpretations of the probability concept. In some cases the frequency approach can be used without difficulties. In other cases the personalistic theory is generally accepted. For the large class of problems where only a relatively limited amount of information is available the economists appear to be reluctant to bring personalistic ideas into the model.—*Journal abstract.*

385. Elshorn, Hillel J. (U. Chicago, Graduate School of Business) Use of nonlinear, noncompensatory models as a function of task and amount of information. *Organizational Behavior & Human Performance*, 1971(Jan), Vol. 6(1), 1-27.—Assessed the effect of 2 variables, as they affected the use of nonlinear noncompensatory models in decision making, in 2 tests with 30 graduate students and 30 faculty members and recent PhDs. Variables were type of decision task and amount of information. The former variable was found to have a marked effect on the kind of combination model used by Sa, while the latter had a significant effect on the accuracy with which the various models could adequately represent the decision process. Major findings show considerable use of the nonlinear noncompensatory models with differential use in the decision tasks used. Results for amount of information suggest that Sa use complex combinations of models (compound models) to simplify the situation cognitively. In addition, the claim that decision makers do not use additive models in their strategies is supported by the data. (28 ref.)—*Journal abstract.*

386. Emshoff, James R. A computer simulation model of the Prisoner's Dilemma. *Behavior Science*, 1970(Jul), Vol. 15(4), 304-317.—Presents a simulation model which describes in an interpretable way a player

behavior in the two-way choice game which was given a positive bias. It is suggested that a general theory of decision making in the two-way choice game can only be developed by considering the two-way choice game as a special case of a more general theory of decision making. The theory proposed in this paper is based on the assumption that the two-way choice game is a special case of a more general theory of decision making. The theory proposed in this paper is based on the assumption that the two-way choice game is a special case of a more general theory of decision making. The theory proposed in this paper is based on the assumption that the two-way choice game is a special case of a more general theory of decision making.

decision making, originally developed for repetitive, nonsocial, choice situations, to behavior in the coalition game, which typically employs 3 players. A program of experiments testing the application of the theory is reported. Results indicate strong support for the model. An extension of the theory to 2-person games is also presented and the results of a preliminary test are reported.—*Journal abstract.*

398. Phillips, Lawrence D. (Brunel U., Uxbridge, England) **The "true probability" problem.** *Acta Psychologica, Amsterdam*, 1970(Dec), Vol. 34(2-3), 254-264.—Recommends that the idea of a "true" or "objective" probability be discarded. Probability judgments are considered as the result of an individual's feelings of uncertainty, translated into a numerical response by internal decision processes. Many factors, both internal and external to the assessor, may influence the feelings of uncertainty, or the decision processes, or both. From this viewpoint, a probability cannot be wrong; it can, however, be more or less related to stimulus or task characteristics, and it can to varying degrees be affected by memory and cognitive processes, prior experience and information, social and cultural norms, personality, and cognitive styles. Effective training of assessors can be designed only when the influence of these factors on the naive person's judgments is determined. (15 ref.)—*Journal abstract.*

399. Pitz, Gordon F. (Southern Illinois U.) **On the processing of information: Probabilistic and otherwise.** *Acta Psychologica, Amsterdam*, 1970(Dec), Vol. 34(2-3), 201-213.—Suggests that probability estimation is not a useful method for the study of probabilistic information processing (PIP) of naive Ss. Results from probability estimation studies are considered as providing more information about response processes than about PIP as such. A plea is made for a more serious consideration of descriptive models of decision making behavior. 2 models of opinion revision are described that use Bayes' theorem as a starting point, but include the consideration of human error. Finally, a more complex PIP model, which exists in the form of a computer program, is briefly described. (18 ref.)—*Journal abstract.*

400. Rapoport, Amnon. (U. North Carolina, Chapel Hill) **Minimization of risk and maximization of expected utility in multistage betting games.** *Acta Psychologica, Amsterdam*, 1970(Dec), Vol. 34(2-3), 375-386.—Examines the multistage betting game (MBG) which resembles certain sequential investment processes that have been studied by economists, and generalizes static, 2-outcome, gambling experiments conducted by psychologists. 2 models for MBG are proposed, both of which have been studied by economists and psychologists in the areas of portfolio selection and decision making behavior under risk, respectively. The 1st is a minimization of risk model, assuming that the player fixes an expected value and then attempts to minimize the variance of the gamble. The 2nd is an expectation model, assuming maximization of expected utility. Proportional betting policies are presented for both models, assuming in the latter case linear, logarithmic, or power utility functions. Results obtained from 5 male Ss in a computer-controlled MBG experiment show systematic effects of capital size on betting decisions, which are incompatible with any proportional betting policy. Decision making and learning: A simulated marketing manager. *Behavioral Science*, 1970(Jul), Vol. 15(4), 370-379.—Presents the results of a computerized adaptive learning model. The learner in this case is a hypothetical marketing manager competing with 2 competitors in a common market. The model is free of heuristic rules-of-thumb and relies instead on a search procedure which updates current decisions based on decisions made and experiences realized in the past. It is also adaptable to other learning environments.—*Journal abstract.*

402. Snapper, Kurt J. & Peterson, Cameron R. (U. Michigan) **Information seeking and data diagnosticity.** *Journal of Experimental Psychology*, 1971(Mar), Vol. 87(3), 429-433.—Presents the results of 2 experiments with 16 male undergraduates which examined the effects of differential diagnosticity upon how much information Ss purchase before making decisions. In an optional stopping task, the optimal strategy is to set a stopping criterion and then purchase information until that criterion is reached. The optimal criterion increases with the expected diagnostic value of a datum so that the expected number of data purchased 1st increases and then decreases as the diagnosticity increases. Ss showed a bias to purchase the most information at low rather than intermediate levels of diagnosticity. It is suggested that this bias may be attributed to a sluggishness in changing the stopping criterion with diagnosticity.—*Journal abstract.*

403. Stager, Paul & Muter, Paul. (York U., Toronto, Ontario, Canada) **Instructions and information processing in a complex task.** *Journal of Experimental Psychology*, 1971(Feb), Vol. 87(2), 292-295.—Designed 2 experiments involving a decision task with a static display analog of a radar display similar to that used in air traffic control. 50 male undergraduates were required to detect potential collision situations in a sequence of independent displays. Ss in both experiments either (a) were trained entirely with pictorial displays and provided with assumptions involved in constructing the air traffic situations, or (b) were initially trained with displays containing verbal descriptions of possible situations and not given underlying assumptions. In Exp. I, a secondary loading task was performed concurrently with the decision task. In Exp. II, Ss analyzed both redundant and nonredundant displays. Results indicate that the procedures acquired by pictorially trained Ss were less susceptible to processing overload and that an additional performance advantage derived from their use of redundancy in the displays.—*Journal abstract.*

404. Thornton, Jerry W. (Angelo State U.) **Avoidable and unavoidable shock transfer.** *Perceptual & Motor Skills*, 1970(Dec), Vol. 31(3), 940.—Examined the effects of transfer from 1 shock contingency to another. 20 undergraduates were randomly assigned to 9 transfer conditions of avoidable, unavoidable, and no-shock choice RT trials. Each S received 20 choice RT trials of 1 shock contingency followed by a transfer to 20 choice RT trials of a 2nd contingency. Evidence supports transfer of interference from unavoidable to avoidable shock trials. Implications are discussed in terms of stressor-task relationships.—*Author abstract.*

Sciences, Inst. of Neurology, Moscow) **O sovremennom sostoyanii problemy dominantnosti polusharii golovnogo mozga.** [On the contemporary state of the problem of hemispheric dominance.] *Zhurnal Nevropatologii i Psikiatrii*, 1970(Apr), Vol. 70(4), 521-527.—Presents an analysis of the problem. The data of the literature provide convincing evidence for the joint functioning of the cerebral hemispheres in all forms of human activity. However, at the same time each hemisphere fulfills those functions specific to it, thereby exhibiting the presence of functional asymmetry. One can only speak of hemispheric dominance or specialization with reference to specific functions. In most people sinistral dominance exists for speech and a number of hand movements, whereas dextral dominance exists for: (a) most gnostic functions including gnosis of one's own body, space, and time; (b) several practical forms; and (c) the posturomotor apparatus. (English summary) (27 ref.)—*I. D. London.*

416. **Batuev, A. S.** (Leningrad State U., USSR) **Ob évolutsii lobnykh dolei mozga u mlekopitayushchikh i fiziologicheskikh osnovakh ikh patologii u cheloveka.** [On evolution of the cerebral frontal lobes in mammals and the physiological bases of their pathology in man.] *Zhurnal Nevropatologii i Psikiatrii*, 1970(Jun), Vol. 70(6), 847-852.—Based on data, drawn from the literature and the author's own published and ongoing research, the integrative role of the frontal lobes in rats, rabbits, cats, dogs, simians, and man is discussed. It is concluded that injury to the frontal lobes leads to impairment of (a) the integrative participation of all the cerebral analyzers, (b) perception of the setting in which purposeful activity is to take place, and (c) the possibility of adequate performance of such activity. The frontal areas of the cerebral cortex in primates and especially in man emerge with all their complex and versatile functions as the most important, relatively independent apparatus of the cerebral integrative system. Michigan, Mental Health Research Inst.) **Electrophoretic studies on solubilized proteins of goldfish brain.** *Brain Research*, 1971, Vol. 25, 121-131.—Separated soluble proteins from homogenate of various regions of goldfish brain by gel electrophoretic techniques. Distribution of radioactive proteins formed following injection of a labeled amino acid was studied by direct autoradiography of gel slabs. While dye staining and labeling patterns of electrophoretically separated proteins did not vary among brain regions examined, there were marked differences in the position of stained bands and those detected autoradiographically, suggesting diverse rates of metabolism of these soluble proteins. Unlike the protein staining and labeling patterns, the distribution of multiple electrophoretic bands of solubilized acetylcholinesterase varied among the 5 brain regions examined. Protein bands detected either by dye staining, autoradiography, or by acetylcholinesterase activity did not vary measurably as a result of shock-avoidance training of the goldfish. Further studies with diisopropylfluorophosphate; apparent turnover rates for the multiple forms of acetylcholinesterase in a detergent extract of whole brain were determined. 422. **Makarov, V. A.** (1st Moscow Medical Inst., USSR) **Rol' mindalevidnogo kompleksa v mekhanizme konvergentsii vozbuzhdenii razlichno sensornoi modal'nosti na neuronakh kory bol'shikh polusharii.** [Role of the amygdaloid complex in the mechanism of convergence of modally different excitation in the neurons of the cerebral cortex.] *Doklady Akademii Nauk SSSR*, 1970(Oct), Vol. 194(6), 1454-1457.—Unanesthetized immobilized cats were used to study the relationship of the amygdaloid complex to the convergent interrelationships which develop in the cortical neuron as a result of the stimulation of different systems (the somato- and viscerosensory). Single stimulation of the sciatic and vagus nerves were employed in isolation from and in combination with stimulation of the amygdaloid complex. Extracellular microelectrode recordings were made of the impulse activity of 18 cortical neurons at the peak of maximal activity of the sciatic and vagus nerves (81 and 75 neurons associated with the sciatic and vagus nerves, respectively). 17 of the 81 neurons were polysensory; 14 of the latter. Prior stimulation of the amygdaloid complex exerted considerable influence on the distribution in the cortical neurons of convergent excitation resulting from stimulation of the sciatic and vagus nerves (increase in polysensory neurons, associated with the sciatic and vagus nerves, rising to 29 and 28, respectively). The amygdaloid complex is viewed as modulating the excitation of the subcortical structures and as influencing the processes of excitatory convergence at the cortical level. (15 ref.)—*D. London.*

activity in the cervical and lumbar sympathetic trunk by unmyelinated somatic afferents. *Brain Research* 19 (1970 Vol. 24:2), 207-218.—Studied the characteristics of the sympathetically reflex responses recorded from the lumbar or cervical sympathetic trunk upon electrical stimulation of unmyelinated somatic fibres (C-fibers) in 10 decerebrate cats and in 10 cats anesthetized with chloralose. The vagus and splanchnic nerves were cut. At a repetition rate slower than $\frac{1}{2}$ sec. A + C afferent volleys usually induced reflex discharges that were related to the A-activity only (sympathetic A-reflex). However, if pairs or short trains of stimuli were given a late reflex component appeared (sympathetic C-reflex). The C-reflex was caused by the activity of the C-fibers and disappeared if the stimulus strength was lowered beyond the threshold of the unmyelinated fibres, but persisted if the A-fibre activity was blocked electrically. Large C-reflexes were induced by different stimulus at stimulus repetition rates faster than $\frac{1}{2}$ sec. The size of the reflexes increased with increasing repetition rates. 10-20 stimuli were necessary to obtain the maximal reflex effects (recruitment of sympathetic C-fibers). The C-reflexes were not appreciably affected by the central actions of preceding A-stimuli. The physiological significance and possible mechanisms of the reflexing response are outlined. (24 ref.)—*Journal summary.*

424 Van Twyver, Henry & Allison, Truett, Veterans Affairs Medical Center, West Haven, Conn. Sleep in the opossum *Didelphis marsupialis*. *Brain, Behavior, Sleep, & Clinical Neurophysiology*, 1970 Aug. Vol. 20(4), 181-189.—Studied polysomnographic waking and sleep in opossums. On the basis of many criteria slow wave sleep (SWS) and paradoxical sleep (PS) were judged to very similar to those states in placental mammals. Carotid and hypoglossal activity during waking and both states of sleep were topographically similar. During PS brain temperature increased and blood pressure decreased whereas heart and respiratory rates became irregular. Neck muscle tension was always relaxed during PS. The weak muscle tension during SWS. Using electrical shocks to the chest, thresholds for changing between arousal from sleep during waking and highest during PS. Based on 24-hr recordings, total sleep time averaged 80.8% of total recording time, and PS comprised 24.7% of total sleep time. It is concluded that the phylogenetic preservation of sleep are closely related to mammalian and placental mammals. The large amount of PS is probably due to the fact that this animal is a primarily nocturnal but active animal. Differences in behavioral characteristics of sleep. (25 ref.)—*Journal summary.*

430 Dechelman, Hury S. (Seattle) Test of Medial Hypothalamus. M.H.S. Effect of subcortical lesions on shock induced aggression in the rat. *Journal of Comparative & Physiological Psychology*, 1970(May) Vol. 74(1), 69-79.—Studied 8 experimental groups of 10 pairs of female Long-Evans stock-bred rats for persistence of learned shock-induced fighting behavior. Subcortical lesions included bilateral and unilateral lesions. Adrenalectomy was also used. The groups included medial hypothalamus and 8 with lesions of the amygdala, anterior cingulate cortex, dorsomedial thalamus, medial hypothalamus, and ventromedial hypothalamus. Hippocampal cortical parietal and pyramidal neurons in shock-induced aggression were observed in the medial and ventromedial hypothalamus groups ($p < .05$). Significant decreases in aggression were observed following amygdala and hippocampal lesions ($p < .05$) and no decrease in aggression was observed in the ventromedial hypothalamus group. Shock-induced aggression (24 hr and 48 hr delay).

431 Flood, Nancy R. & Overmier, J. Bruce, Jr. Memory effects of telencephalic and olfactory lesions on appetitive learning in goldfish. *Behavior & Brain Research*, 1970 Nov. Vol. 2(3):207-212.—Studied the relationship between the fish forebrain and learning in groups of 10 normal, 10 telencephalic ablated, and 10 forebrain ablated goldfish which received either 10 or 20 shocks in a reward trial every 48 hr in a T-maze. Reward learning was best. Ablation of the forebrain also had effect on long-term performance, evidence that the forebrain is not essential in acquisition. However, forebrain ablation required subsequent water stimuli trials to maintain but not under massed trials suggesting that the forebrain may be involved in short-term

memory. Extinction was impaired by both ablation of the forebrain and of the olfactory tracts. (15 ref.)—*Journal abstract*

432. Fried, P. A. (Carleton U., Ottawa, Ontario, Canada) Limbic system lesions in rats: Differential effects in an approach-avoidance task. *Journal of Comparative & Physiological Psychology*, 1971(Mar), Vol. 74(3), 349-353. Tested 28 male albino Wistar rats with bilateral septal, dorsal hippocampal, or ventral hippocampal lesions for their ability to change approach behavior into avoidance behavior and vice versa. Lesions of the septal region impaired the ability of Ss to change approach responding into avoidance, but the dysfunction attenuated as the experiment progressed. Dorsal hippocampal lesions resulted in rapid development of approach behavior following avoidance training whereas ventral hippocampal lesions caused a slight deficit in avoidance performance. 436. Land, Jennifer S., Driver, J. I., & Landry, J. G. (University Coll. London, England) Visual control of limb movement following section of optic chiasm and corpus callosum in the monkey. *Journal of Comparative & Physiological Psychology*, 1971(Mar), Vol. 74(3), 374-383. Found aspiration of the olfactory bulbs to increase the lordosis-to-mount ratio in sexually naive and experienced spayed hormone-treated and 14 normally cycling female Long-Evans, whereas the controls (10 unilateral olfactory bulb removal, 15 sham-operated, and 10 nonoperated) played normal copulatory behavior. No difference was observed in the lordosis duration between the bulbectomized and controls. In regular cycling females, the vaginal estrous cycle was not altered by operation. It is suggested that although olfaction appears to have no effect on the regulation of ovarian activity, it does have a direct effect on the lordosis-to-mount ratio. (16 ref.)—*Journal abstract*

and monocular vision, no change was found in preference with changes in visual input following chiasm section. Marked preference for using the contralateral to the seeing eye was shown for an additional section of the corpus callosum with intact monocular vision, and abnormalities in the use of hand ipsilateral to the open eye were evident. A comparison of the speed of retrieval of a moving target was made between normal monkeys and those with chiasm sectioned and those with optic chiasm, corpus callosum, and anterior commissure sectioned. With binocular vision, only the "split-brain" Ss differed from normal, being slower and more erratic in their performance. These findings lead to a theory of gradualization of subcortical visuomotor linkages under the influence of lateralized vision in the absence of the corpus callosum. The repeated use of new visuomotor linkages does not unseat previously established linkages. The utilization of intrahemispheric visuomotor links can clearly disrupt the simultaneous formation of the apparently weaker interhemispheric linkages in the "split-brain" animal. —R. Gunter

450. **Beideman, Larry R. & Goldstein, Robert.** (Malcolm Bliss Mental Health Center, Behavior Research St. Louis, Mo.) **Specificity of carbachol in the elicitation of drinking.** *Psychonomic Science* 1970(Sep), Vol. 20(5), 261-262.—Reports 2 studies in which 9 male albino rats with hypothalamic cannulae were injected with carbachol. All Ss exhibited drinking following injection. In the 1st study this was demonstrated both prior to and following a series of test sessions, and in the 2nd study, at the end only. During the test sessions themselves, only food was available. Ss displayed no tendency to increase their food intake upon carbachol administration during the 16 test sessions. This was contrasted with the ease with which such shifts have been demonstrated with electrical stimulation and suggests a specificity of function that can be detected with chemical but not electrical stimulation.—*Journal abstract.*

451. **Codish, Stephen D.** (Albany Medical Coll., N.Y.) **Actinomycin D injected into the hippocampus of chicks: Effects upon imprinting.** *Physiology & Behavior*, 1971(Jan), Vol. 6(1), 95-96.—Reports an experimental method to test the effect of actinomycin D on a permanent form of memory. Injections of actinomycin D in the hippocampus of chicks 30 min after imprinting blocked the formation of memory of the imprinting response when tested at 4 days of age, whereas injections 1 day after imprinting did not. Since the imprinting response is known to persist for months after its establishment at an early age, and because the lethal effects of the drug have prevented examination of memory retention over extended periods of time, this experimental design is advantageous in demonstrating that actinomycin D, an inhibitor of RNA synthesis, impairs formation of long-term memory.—*Journal abstract.*

452. **Duncan, Perry M.** (U. Washington) **Effect of temporary septal dysfunction on conditioning and performance of fear responses in rats.** *Journal of Comparative & Physiological Psychology*, 1971(Mar), Vol. 74(3), 340-348.—Determined the effect of septal dysfunction on fear conditioning apart from performance effects such as response perseveration and decrement in freezing. 9 male Long-Evans rats were subjected to tone-shock pairings while in a state of temporary septal dysfunction resulting from injection of procaine into the septum via chronically implanted cannulae. 10 non-operated, 6 cannula-only, 8 saline-injected, and 6 delayed procaine-injected Ss were controls. When tested for conditioned suppression in the normal state, Ss that had been conditioned immediately following procaine injection suppressed significantly less than did controls, indicating that septal dysfunction impaired conditioning. The deficit could be partially responsible for previously reported effects of septal damage on passive avoidance. Procaine injection also temporarily reduced freezing elicited by the CS, whereas electrolytic septal damage caused a permanent deficit in freezing behavior.—*Journal abstract.*

454. **Komissarov, I. V. & Talalaenko, A. N.** (Donetsk Medical Inst., USSR) **K analizu retseptivnykh struktur, uchastvuyushchikh v izmeneniyakh povedencheskikh reaktsii koshek, vyzvannykh katekholaminami i serotoninom.** [On the analysis of

receptive structures participating in changes in cat behavioral reactions caused by catecholamines and serotonin.] *Biulleten' Ispytatel'noi Biologii i Meditsiny*, 1970(Sep), Vol. 70(9), 42-45.—31 cats were used to study the receptive structures through which is mediated the action of catecholamines, serotonin, and their antagonists, injected into the lateral ventricle, upon the motor and autonomic components of behavioral reactions. Noradrenaline, adrenaline, mesatone, and serotonin depressed motor activity. Isadrine did not exert a similar effect. Propranolol (β -adrenolytic) and morphine did not alter, whereas d-ergotamine (DET)—an antagonist of catecholamine effects and serotonin D-effects) and phentolamine (α -adrenolytic) did shorten the duration of the depressive effect of noradrenaline, but not of serotonin. Morphine distorted the serotonin-induced reaction, as seen not by any inhibition of motor activity, but by its excitation, which was depressible by DET and LSD. It appears that motor inhibition, due to bioamines, is associated with action of the α -adreno- or M-serotoninsensitive receptors. The inversion of serotonin action is connected with aminergic action on the D-serotoninsensitive structures of the brain. (English summary)—*I. D. London.*

455. **Lovett, D. & Singer, G.** (Macquarie U., North Ryde, New South Wales, Australia) **Ventricular modulation of drinking and eating behavior.** *Physiology & Behavior*, 1971(Jan), Vol. 6(1), 23-26.—In an experiment with 11 male Wistar rats injections of carbachol into the lateral cerebral ventricles of Ss increased water intake in both satiated and deprived Ss and injections of norepinephrine elicited eating. This is in contrast to earlier studies which have failed to elicit drinking under similar conditions and indicates that the ventricle may at least be partially involved in some of the behavioral changes observed after chemical stimulation of specific neuroanatomical structures. In support of previous work, high doses of atropine reduced drinking, as did norepinephrine. The latency to drink to carbachol was also investigated. (24 ref.)—*Journal abstract.*

456. **Reinis, Stanislav.** (York U., Downsview, Ontario, Canada) **Further study of the learning deficit produced by hydroxylamine.** *Physiology & Behavior*, 1971(Jan), Vol. 6(1), 31-34.—Trained 168 male Swiss albino mice in alimentary conditioning, light associated with food pellet. Hydroxylamine injected intracranially from 4 hr to 3 wk after the end of training series interfered with the retention of the learned task. Hydroxylamine injected 4 wk after the end of training and later, was ineffective. In the 6th and 8th wk after the end of training, the forgetting appeared in all groups of Ss. Retraining was possible in all groups. Learning of another task, 1-trial learning situation, parallel with the testing series of sessions, was not affected by previous injection of hydroxylamine.—*Journal abstract.*

457. **Reinis, Stanislav.** (Ghana Medical School, Accra) **Time-dependent learning deficit caused by hydroxylamine.** *Psychonomic Science*, 1970(Nov), Vol. 21(3), 179-180.—In an experiment with 840 Swiss albino mice, the effect of .5-M hydroxylamine injected intracranially was studied on a passive-avoidance task. Hydroxylamine administered 24 hr before the acquisition trial or earlier had no effect on performance. Hydroxylamine injected 2 hr before the acquisition trial impaired the performance of Ss tested 24, 48, 72 hr., or 1 wk later. Hydroxylamine injected 1, 2, or 24 hr. later interfered with the performance of Ss. The later

hydroxylamine was injected, the later the impairment of performance appeared. It is concluded that the effect of hydroxylamine is probably associated with the "mutagenic" action of the drug on activated DNA.—*Journal abstract.*

459. Clarke, Samuel & Trowill, Jay A. (U. Massachusetts) **Sniffing and motivated behavior in the rat.** *Physiology & Behavior*, 1971(Jan), Vol. 6(1), 49-52.—Investigated the effect, in 2 experiments, of rewarding brain stimulation on inspiration rate in 4 male Charles River rats, using a temporal conditioning and a fixed-interval lever-pressing procedure. In early temporal conditioning trials, inspiration frequency was most pronounced following brain stimulation. With conditioning, inspiration frequency became most pronounced preceding brain stimulation. Inspiration frequency in the sniffing range remained part of the unconditional response to rewarding brain stimulation throughout both experiments. In the fixed-interval procedure, inspiration frequency increased just prior to the 1st lever-press of an interval, and continued to increase until reinforcement was delivered. Results suggest that measurement of respiration/sniffing frequency may have relevance to classical conditioning interpretations of motivated behavior. (18 ref.)—*Journal abstract.*

460. Colavita, Francis B. & Szeligo, Frank. (U. Pittsburgh) **Classical conditioning with brain stimulation at one site serving as both CS and US.** *Physiology & Behavior*, 1971(Jan), Vol. 6(1), 41-44.—3 adult healthy cats with chronic electrodes in the inferior colliculus received paired presentations of a weak (CS) and a strong (UCS) electrical stimulus delivered through the same electrode. After 140-200 such pairings, the weaker stimulus was able to elicit a close approximation to the unconditioned motor response elicited by the stronger stimulus. The response eventually elicited by the weaker stimulus was seen to extinguish following a series of presentations of the weaker stimulus alone. 2 additional Ss receiving the same number of unpaired presentations of the weak and strong electrical stimuli, failed to acquire the tendency to make a motor movement in the presence of the weak stimulus. The weak electrical stimulus coming to evoke a response originally elicited only by a stronger stimulus is explained on the basis of classical conditioning rather than pseudoconditioning or sensitization.—*Journal abstract.*

461. DeVietti, Terry L. & Larson, Raymond C. (Central Washington State Coll.) **ECS effects: Evidence supporting state-dependent learning in rats.** *Journal of Comparative & Physiological Psychology*, 1971(Mar), Vol. 74(3), 407-415.—Conducted 2 experiments to test specific predictions of the state-dependency hypothesis concerning the effects of ECS on learning. 145 male Long-Evans rats received a single fear-conditioning trial followed 24 hr. later by 1 of the following treatments: noncontingent footshock (NCFS), NCFS and ECS, or just ECS. Modification of fear conditioning by the various treatments was assessed by a

drink-latency measure 24 and 96 hr. posttreatment. Exp. I demonstrated "amnesia" during the 24-hr test and recovery of memory during the 96-hr test by NCFS-ECS Ss. Exp. II showed that extinction training presented 24 hr. after NCFS-ECS treatment was not retained when testing occurred 96 hr. after this treatment. Results of both experiments clearly indicated that the combination of footshock and ECS can produce state-dependent learning. These data indicate that experiments that have used procedures involving footshock followed closely by ECS to demonstrate the disruption of memory formation as a consequence of ECS are also subject to a state-dependency interpretation. (31 ref.)—*Journal abstract.*

463. Goldrich, Stanley G. & Stamm, John S. (Ohio State U., Lab. of Comparative & Physiological Psychology) **Electrical stimulation of inferotemporal and occipital cortex in monkeys: Effects on visual discrimination and spatial reversal performance.** *Journal of Comparative & Physiological Psychology*, 1971(Mar), Vol. 74(3), 448-458.—Trained 4 stump-tail monkeys with bilaterally implanted occipital and inferotemporal electrodes on pairs of pattern discriminations. Acquisition rates were compared on blocks of testing trials preceded by EEG disturbances set off by electrical brain stimulation. Inferotemporal stimulation had little effect on performance. Slight transient deficits were found during overtraining with inferotemporal stimulation. In Exp. II Ss were trained on a series of spatial reversal tasks after inferotemporal stimulation and without stimulation. No significant behavioral deficits occurred under the former condition. The stimulation technique used was found to be an efficient method of studying the effect of electrocortical impairment on behavior.—*Journal abstract.*

464. Haworth, John T. (U. Manchester, England) **Conditioned emotional response phenomena and brain stimulation.** *British Journal of Psychology*, 1971(Feb), Vol. 62(1), 97-103.—Implanted electrodes into the septal region of 8 male albino rats and into the hypothalamic region in 8 other rats. After stabilizing for lever-pressing rates on a variable interval (VI) schedule for brain stimulation, 4 septal and 4 hypothalamic Ss were given the conditioning procedure for a CER while they could not obtain brain stimulation, and the other Ss were given the conditioning procedure while they were lever-pressing for brain stimulation. Manifestation of the CER was tested while Ss were bar-pressing for brain stimulation and it was found possible to condition a CER in all Ss. Exp. II using 4 hypothalamic Ss showed that the CER was still manifest on a faster VI schedule, the same as that used for the septal Ss. Exp. III using 4 hypothalamic Ss showed that when the group was on a CRF schedule the CER was significantly attenuated even though it was later manifest on a VI schedule. Findings indicate that (a) the CER technique using brain stimulation reinforcement should prove useful for the study of the interaction between motivation and CERs, and (b) comparisons between different brain loci for CER phenomena should be based on parametric studies of schedule reinforcement and current intensity.—*Journal abstract.*

466. Kesner, Raymond P. (U. Utah) **ECS as a punishing stimulus: Dependency on retrograde amnesia, duration of anterograde amnesia, and intensity of pain.** *Journal of Comparative & Physiological Psychology*, 1971(Mar), Vol. 74(3), 398-406.—Tested 257 hooded rats in a step-down apparatus for the development of fear as a result of repeated ECS treatments. Familiarization with the step-down apparatus prior to administration of ECS treatments or presentation of ECS treatments at an optimal step-down response-ECS delay interval facilitated development of fear. On the other hand, morphine, injected immediately after an ECS treatment or increasing the duration of the postictal depression phase which follows each ECS treatment, delayed the establishment of fear. Furthermore, fear did not develop if an aversive experience (footshock) was administered during the postictal depression phase. Results are interpreted as supporting a previously formulated model by R. P. Kesner, W. E. Gibson, and M. J. LeClair (see PA, Vol. 44:20197) which describes the mechanisms accounting for the development of ECS-induced fear.—*Journal abstract*.

New York, Stony Brook) **Behavioral measurement of neural poststimulation excitability cycle: Pain cells in the brain of the rat.** *Science*, 1970(Jan), Vol. 167(3917), 393-396.—A new technique in which elicited behavior of the freely moving rat is used to measure the poststimulation excitability cycle of the central neurons mediating that behavior has been adapted from accepted methods of neurophysiology. A continuous train of pairs of brief pulses was delivered to pain systems in the midbrain of 18 male Sprague-Dawley rats. Rate of lever pressing to achieve 3-sec rests from this stimulation was measured as a function of the interval separating the pulses within pairs. Evidence for latent addition, absolute refractory period, temporal summation, and adaptation was demonstrated. Obtained relationships suggest that 3 sets of fibers may carry the aversive signal and that synaptic integration of pain in the brain may be related to Stevens' power law functions. Western Ontario, London, Canada) **Brain self-stimulation and mechanisms of reinforcement.** *Learning & Motivation*, 1970(May), Vol. 1(2), 186-198.—Rats receiving electrical stimulation of the brain frequently display some form of species-typical behavior, such as drinking or feeding, as well as self-stimulation. The role of this response-elicitation effect in response-reinforcement during self-stimulation was investigated in an experiment with 11 male Wistar rats. Results indicate

that although response-reinforcement accompanies self-stimulation, it is not essential for response-reinforcement. Rather, the sensory feedback from elicited behavior may be another source of afferent input which interacts with an integrative-control system for physiological regulation to influence response reinforcement (34 ref.)—*Journal abstract*.

(Netherlands Central Inst. for Brain Research, Amsterdam) **Induction of sexual arousal in the castrated male rat by intracranial stimulation.** *Physiology & Behavior*, 1971(Jan), Vol. 6(1), 85-86.—Reports that electrical ICS in the medial preoptic area in 2 male Wistar rats caused a drastic increase in sexual activity. Stimulation of a castrated S induced vigorous mounting behavior and even a few intromissions, but no ejaculations.—*Journal abstract*.

479. Van Dis, Huib & Larsson, Knut. (Netherlands Central Inst. for Brain Research, Amsterdam) **Seminal discharge following intracranial electrical stimulation.** *Brain Research*, 1970, Vol. 23(3), 381-386.—Explored various regions of the rat brain for the possible occurrence of seminal discharges produced by various pulse frequencies of electrical stimulation. Electrode placements in 102 Wistar rats were aimed at the medial and lateral preoptic areas, lateral hypothalamus, central gray, mammillary bodies, caudate nucleus, globus

pallidus, and occipital cortex. Seminal discharge was observed in 81% of all Ss in at least 1 of 6 tests following electrical stimulation. Frequencies of 60-100 cps were most effective in producing the response. Findings are compared to those from studies with the squirrel monkey and baboon.—*Journal summary.*

480. Wyrwicka, Wanda & Chase, Michael H. (U. California, Medical School Los Angeles) **Projections from the buccal cavity to brain stem sites involved in feeding behavior.** *Experimental Neurology*, 1970(Jun), Vol. 27(3), 512-519.—Explored the possibility that afferent information from orogastric receptors plays a key role in the regulation of the activity of brainstem feeding centers. Electrical stimulation was applied to the inferior alveolar nerve of 15 immobilized adult cats. Short-latency evoked responses were recorded from the specific thalamic projection nucleus, ventralis posteromedialis. Potentials of longer latency were observed in mesencephalic and diencephalic regions which are involved in the regulation of feeding behavior. The extent to which afferent information from buccal receptors may influence brainstem sites involved in feeding behavior is discussed. (30 ref.)—*Journal abstract.*

481. Young, A. Grant & Day, H. D. (Louisiana State U.) **ECS effects following continuous and partial reinforcement training.** *Psychonomic Science*, 1970(Nov), Vol. 21(3), 131-132.—Trained 32 naive male albino rats to leverpress for sucrose using a free-operant procedure. $\frac{1}{2}$ the Ss were trained on a CRF schedule, and the other $\frac{1}{2}$ were trained on a variable-ratio schedule (VR 2). Following acquisition, for $\frac{1}{2}$ of Ss in each group, a leverpress produced footshock followed by ECS. For the remaining Ss, a leverpress produced footshock only. Results show that (a) suppression of the leverpress response due to footshock was reduced by the ECS, regardless of the acquisition reinforcement schedule; and (b) the VR-trained Ss that received ECS failed to show the partial reinforcement effect in extinction noted in previous studies.—*Journal abstract.*

ELECTRICAL ACTIVITY

482. Barek, J. David. (Windham Coll.) **Hippocampal afterdischarges and conditioned emotional response.** *Psychonomic Science*, 1970(Sep), Vol. 20(5), 297-299.—When footshock in a conditioned suppression task is followed by either local or generalized seizure, no suppression develops. The production of a localized seizure produces the same performance decrement as does electroconvulsive shock. Results suggest that the hippocampus is involved in memory processing. 26 chronically implanted male Wistar rats used previously in passive avoidance served as Ss. (19 ref.)—*Journal abstract.*

483. Bennett, Thomas L. & Gottfried, Jeffry. (Colorado State U.) **Hippocampal theta activity and response inhibition.** *Electroencephalography & Clinical Neurophysiology*, 1970(Aug), Vol. 29(2), 196-200.—To examine T. L. Bennett's hypothesis that theta activity may reflect the role of the hippocampus in response inhibition, hippocampal activity was monitored while 6 adult cats with chronically implanted electrodes learned and were shifted from a CRF to a DRL schedule in an operant conditioning apparatus. If the hypothesis was true, it was predicted that theta activity would occur between correct responses as the S mastered the DRL task and hence improved in his ability to inhibit his

previously CRF response task. Results did not support the hypothesis. It was found that small amplitude, fast desynchronized activity dominated the hippocampal records throughout training. When theta activity occurred, it was always associated with orienting responses. The results cast doubt on W. R. Adey's hypothesis that the appearance of theta activity during learning reflects the role of the hippocampus in decision making and memory consolidation. Also, the findings support E. Grastyán's contention that the main behavioral correlate of hippocampal theta activity during learning is the orienting response. (French summary)—*Journal summary.*

484. Borda, Robert P. (Baylor Coll. of Medicine, Houston, Tex.) **The effect of altered drive states on the contingent negative variation (CNV) in rhesus monkeys.** *Electroencephalography & Clinical Neurophysiology*, 1970(Aug), Vol. 29(2), 173-180.—Studied contingent negative variation (CNV) in 4 female rhesus monkeys using epidural and subcortical platinum-platinum electrodes and long-time constant, capacitor-coupled amplifiers. The study was designed to determine the effects of different levels of drive, as determined by normal diet or total deprivation of food, on the amplitude of the CNV in Ss trained to respond for a food reward. Recordings made over several mo. led to the following conclusions: (a) At least 2 independent negative slow potentials are present during the course of conditioning a task of this type; 1 is present over the frontal regions and the other over more central areas. The 2 potentials may sum to produce the CNV typically recorded at the scalp. (b) The central-dominant potential decreases in amplitude with overtraining, appearing most commonly after periods of food deprivation. The frontal-dominant potential reaches its maximal amplitude early in training and continues to be present as long as the S maintains a high level of performance. (c) The CNV is not related in any simple manner to drive. It is suggested that food deprivation acts to increase the probability of S's detecting the cues and subsequently making a correct response, and that the frontal-dominant potential may, therefore, be the electrical sign of activation of a basic mechanism of selective attention subserved by nonspecific thalamocortical pathways. (French summary) (27 ref.)—*Journal summary.*

485. Carson, Virginia G., Kado, Raymond T., & Wenzel, Bernice M. (U. California Medical School Los Angeles) **Method for recording foot pad impedance in freely moving mice.** *Physiology & Behavior*, 1971(Jan), Vol. 6(1), 77-80.—Measured the foot pad impedance of a freely moving mouse in a shock runway. Foot pad impedance measurement consisted of a constant current circuit for measuring impedance when the current was subthreshold and a constant voltage circuit for measuring impedance when the current was at an aversive level. Both of these circuits are diagrammed and discussed. Foot pad impedance records obtained by this method are shown.—*Journal abstract.*

486. Coquery, Jean M. & Conlmann, Michele. (National Center of Scientific Research, Dept. of General Psychophysiology, Marseille, France) **Variations d'amplitude des réflexes monosynaptiques avant un mouvement volontaire.** [Variations of the amplitude of monosynaptic reflexes before a voluntary movement.] *Physiology & Behavior*, 1971(Jan), Vol. 6(1), 65-69.—Changes in monosynaptic reflexes of triceps surae were tested in 7 male Ss during a voluntary

contraction of either the muscle involved in the test (extension of foot), or the antagonistic muscle (flexion of the foot), or a muscle not involved in the test (clenching the fist). When the foot was extended, the amplitude of the reflexes of triceps surae 1st showed a slight decrease between 500 and 100 msec. before the EMG of the contraction, followed by an increase which built up during the extension phase. A flexion of the foot, however, was preceded by a sustained diminution of the reflexes amplitude. Clenching the fist was accompanied by a rise in the excitability of the motoneurons of triceps surae. In every case, the changes in spinal excitability brought about by the voluntary motor command could be detected at least 100 msec. before the beginning of the EMG of the movement. (Walter Reed Army Inst. of Research, Washington, D.C.) **Somatic and visceral receptive field properties of fibers in ventral quadrant white matter of the cat spinal cord.** *Journal of Neurophysiology*, 1970(Nov), Vol. 33(6), 827-837.—Single fibers were recorded from in the ventral quadrant white matter of the spinal cord of the spinal cat. Widespread excitatory and inhibitory visceral and somatic input was found. Small amounts of barbiturate greatly reduced the size of the excitatory somatic receptive fields but did not eliminate the response to visceral stimulation. No significant differences were found in the properties of those fibers which ascended to supraspinal structures and those that were classified as propriospinal.—*G. Westheimer.*

490. Fowles, Don C. & Venables, P. H. (U. Iowa) **The reduction of palmar skin potential by epidermal hydration.** *Psychophysiology*, 1970(Sep), Vol. 7(2), 254-261.—Simultaneous measurements of palmar skin potential (SP) at 4 levels of epidermal hydration in 10 male staff members and students yielded a difference of 35 mV between the mean values for the least hydrated site (pretreated with polyethylene glycol) and the most hydrated site (pretreated with distilled water) during sweat gland activity. It was also demonstrated that there was a decline in SP during the 1st 15 min. of recording with aqueous electrolyte which can be attributed to the application of an electrolyte to the skin. Thus the hydration effect appears to be a large, uncontrolled source of variance which must be brought under control if physiologically meaningful results are to be obtained with SP measurements. The hydration effect may offer an alternative interpretation of data previously cited as supporting the hypothesis that an epidermal membrane contributes to SP.—*Journal abstract.*

491. Frost, James D. (Baylor Coll. of Medicine, Houston, Tex.) **An automatic sleep analyzer.** *Electroencephalography & Clinical Neurophysiology*, 1970(Jul), Vol. 29(1), 88-92.—Describes a small, portable, special-purpose device which accomplishes automatic on-line evaluation and graphing of an S's sleep status. The instrument performs EEG analysis as an amplitude-

weighted, dominant-frequency meter to define stages awake through Stage 4 sleep, and also considers electrooculogram information to permit detection of the REM state.—*Journal summary.*

492. Gassel, M. Michael & Ott, Kenneth H. (U. California, Medical School, San Francisco) **Motoneuron excitability in man: A novel method of evaluation by modulation of tonic muscle activity.** *Electroencephalography & Clinical Neurophysiology*, 1970(Aug), Vol. 29(2), 190-195.—Describes a technique based on the observation that during tonic activity, motor unit discharge increased with facilitation of the reflex and decreased with inhibition of the reflex. A system was developed for graphic recording of the modulation of EMG activity following a conditioning stimulus. The EMG is passed through an absolute-value rectifier circuit and then summed by computer whose sweeps are triggered by the conditioning stimulus. An X-Y plot is then made of the summed potentials ("modulation curve") representing the graph of activity changes following the conditioning stimulus. The modulation curve resembled but did not reflect precisely changes in central excitability recorded by the classical recovery curve. The modulation curve is rapidly and easily performed. It can be elicited from any muscle, flexor or extensor, and is not restricted to the few large muscles with prominent stretch reflexes as is true in the classical technique. The method is especially adapted to the study of the response characteristics of spontaneous activity in clinical EMG. (French summary)—*Journal summary.*

493. Gavrilskii, V. St. (Higher Inst. of Physical Culture, Sofia, Bulgaria) **Vliyaniye zvukovoi stimulatsii na elektroretinogrammu cheloveka.** [Influence of acoustic stimulation on the electroretinogram in man] *Fiziologicheskii Zhurnal SSSR*, 1970(Sep), Vol. 56(9), 1215-1218.—28 19-25 yr. old Ss participated in a study of the electroretinogram (ERG) changes which occur upon excitation of the optic nerve, simultaneously with excitation of other cortical centers, particularly the auditory cortical center, evoked by the action of an acoustic stimulus. It is shown that acoustic stimulation influences several ERG parameters, probably through inductive interaction between the auditory and visual cortical centers. Data are treated in such a way that the mechanisms in ERG changes are viewed as involving the functional state of 1 or another cortical center. (41 ref.)—*J. D. London.*

494. Goblick, Thomas J. & Pfeiffer, Russell R. (Massachusetts Inst. of Technology, Lincoln Lab., Lexington) **Time-domain measurements of cochlear nonlinearities using combination click stimuli.** *Journal of the Acoustical Society of America*, 1969(Oct), Vol. 46(4, Pt. 2), 924-938.—The interleaving peak structure of poststimulus time (PST) histograms of low-frequency cochlear-nerve-fiber responses to acoustic clicks of both polarities implies that a cochlear neuron is excited by a damped oscillatory waveform, referred to as a click excitation function (CEF) that is $\frac{1}{2}$ -wave rectified. For a stimulus consisting of 2 closely spaced clicks, the amplitude and delay of the 2nd click relative to the 1st click can be adjusted so that $\frac{1}{2}$ cycle of the CEF due to the 1st click nulls or cancels a particular $\frac{1}{2}$ -cycle of the other CEF. A null produced in this manner can be detected from the PST histograms of responses of a particular fiber to both polarities of the click-pair stimulus. This nulling technique has been used to study the responses of cochlear nerve fibers to combination click stimuli. Details of these measurements are given.

and the interpretation of the results leads to the consideration of 2 apparently different nonlinear phenomena. Results and the techniques used to obtain them provide a means by which certain constraints on the mechanisms of the peripheral auditory system can be evaluated.—*Journal abstract.*

495. Goldstein, Sanders. (NASA, Electronics Research Center, Cambridge, Mass.) **Phase coherence of the alpha rhythm during photic blocking.** *Electroencephalography & Clinical Neurophysiology*, 1970(Aug), Vol. 29(2), 127-136.—Examined the pre- to postblocked phase angle relationship of the photically blocked alpha rhythm in light of a pacemaker model. The question is asked whether this pacemaker is in continuous operation during photic blocking even though, within this period, the detected alpha oscillation may vanish. Analysis of data shows 1st, a postblocked alpha rhythm coherence, and 2nd, a mean 0 phase angle between the postblocked and preblocked wave trains. 3 normal human Ss were used. Results are consistent with the idea of a basic pacemaking system, but because of conservation of phase information during the photic block, they are at variance with the concept that photically induced desynchronization must take place at the pacemaker level. The results are discussed further in terms of a visual information intake model used by K. Gaarder, R. Koresko, and W. Kropfl. (French summary)—*Journal summary.*

497. Lentz, William E. (U. Utah) **Augmentation of the averaged electro-encephalic auditory response in passive adults.** *Dissertation Abstracts International*, 1970(Nov), Vol. 31(5-B), 3054-3055.

498. Lykken, David T. (U. Minnesota, Psychiatric Research Unit) **Square-wave analysis of skin impedance.** *Psychophysiology*, 1970(Sep), Vol. 7(2), 262-275.—Describes a method for studying skin impedance phenomena, based on analysis of waveforms of current through the skin produced by square voltage pulses. In several experiments, the method was used to provide data relevant to the choice of an appropriate equivalent circuit for skin. Removal of the stratum corneum eliminated the parallel resistive and capacitive elements, and slightly reduced the series or "ohmic" resistance. During healing the source of skin potential recovered before the other electrodermal parameters had returned to normal. The relationship of these parameters to electrode area, current density, and site temperature is discussed. It is argued that the capacitance of skin may not vary with the frequency of the measuring current, in contrast to traditional views. (15 ref.)—*Journal abstract.*

499. Maltzman, Irving; Harris, Lance; Ingram, Eben, & Wolff, Craig. (U. California, Los Angeles) **A primacy effect in the orienting reflex to stimulus change.** *Journal of Experimental Psychology*, 1971(Feb), Vol. 87(2), 202-206.—Recorded the GSR from 96 undergraduates, $\frac{1}{2}$ of whom entered a dimly lit experimental room and $\frac{1}{2}$ who entered a relatively brightly lit room. The room illumination then changed and changed back repeatedly every 5, 10, or 30 sec., for different groups of Ss. The GSR measure of the orienting reflex evoked by the 1st kind of change was significantly larger than the orienting reflex evoked by the change back to the original level. The significant effect was obtained even in

the 30-sec group. The primacy effect in magnitude of the orienting reflex evoked by different stimulus changes occurred regardless of whether the initial change was an increase or a decrease in illumination, although the increase in illumination induced significantly larger GSRs than the decrease. It is suggested that this primacy effect may reflect the inhibitory influence of orienting reflex may have upon another induced by a subsequent stimulus change.—*Journal abstract.*

500. Mandl, George. (McGill U., Montreal, Quebec, Canada) **Localization of visual patterns by neurons in cerebral cortex of the cat.** *Journal of Neurophysiology*, 1970(Nov), Vol. 33(6), 812-826.—Microelectrode recording from single cells in the visual cortex of the cat was carried out with targets containing straight dark-light borders which were rapidly "flicked" back and forth. Unit discharges were either increased or decreased, and responses could be obtained when the visual border was in several areas.—G. Westheimer.

501. Martin, Randall B. & Dean, Sanford J. (Northern Illinois U.) **Instrumental modification of the GSR.** *Psychophysiology*, 1970(Sep), Vol. 7(2), 178-185.—Investigated the effects of instructions, response-contingent shock, and the latency of the critical response on the GSR in 4 experiments with 109 undergraduates. Using a discrimination procedure, in which responding in the presence of 1 stimulus avoided shock while responding in the presence of another led to shock, it was found that relative to noninstructed, yoked-noncontingent conditions, instructed Ss responded at higher levels to the respond stimuli and at lower levels to inhibit stimuli. The effects of instructions appeared stronger than the effects of the shock contingencies. Only when the "contingent" GSR was of the "anticipatory" latency were differential effects obtained. No effects were observed in the absence of cognitive mediation.—*Journal abstract.*

502. Peregrin, J. & Světlík, J. (Charles U., Inst. of Physiology & Ophthalmological Clinic, Hradec Králové, Czechoslovakia) **Relationship between the intensity of a light stimulus and the amplitude of the reaction in the electroretinogram in man.** *Physiologia Bohemoslovaca*, 1968, Vol. 17(4), 337-342.—Studied the dependence of the potential values of the negative and positive components of the electroretinogram (ERG) in man on the intensity of photostimulation in the range of 5 log u. The relationship between the intensity of light stimuli and the potential value of the ERG—intensity-reaction (I-R) curve—can be expressed mathematically by a logistic function. Mathematical calculations and a comparison with the I-R curve of congenital hemeralopia indicate that the positive component of the ERG consists of a superposition of photopic and scotopic wave at higher intensities. The time values of implicit times of both the negative and positive components of the ERG within the range of light stimuli used are given. (Russian summary)—*Journal summary.*

503. Pfeiffer, Russell R. & Molnar, Charles E. (Washington U.) **Cochlear nerve fiber discharge patterns: Relationship to the cochlear microphonic.** *Science*, 1970(Mar), Vol. 167(3925), 1614-1616.—In an experiment with adult cats, Fourier analysis of discharge patterns in response to sinusoidal acoustic stimulation provided a consistent and repeatable measure of response phase and amplitude. The variation of the fundamental and harmonic components of the patterns as stimulus parameters were changed was strikingly similar to that of cochlear microphonics. Results were significantly different for single fibers with different

characteristic frequencies: variations paralleled those of microphonics recorded from different cochlear turns.—*Journal abstract.*

504. Saunders, James C. & Rhyne, Robert L. (Princeton U., Auditory Research Lab.) **Cochlear nucleus activity and temporary threshold shift in cat.** *Brain Research*, 1970, Vol. 24(2), 339-342.—Investigated the neurophysiological correlates of temporary threshold shift (TTS) in 5 cats. Arbitrarily chosen levels of the frequency following response (FFR) were considered "at a variety of pure tone frequencies before and after exposure to intense noise." Each S was tested twice under sodium pentobarbital. Results show (a) "an inverse relationship between pre-exposure sensitivity and post-exposure TTS changes," and (b) "recovery functions all tended to be somewhat linear in the logarithm of time." It is concluded that FFR was effected by the exposure to intense noise, and that the noise effects were temporary in nature and exhibited a recovery course similar to that previously reported in the cat and man. It is suggested that simultaneous recordings from the CN and other sites in the peripheral auditory system could be used to develop techniques for establishing neural correlates.—*S. Knapp.*

Wisconsin) **The harmonies of movement recorded electromyographically.** *Perceptual & Motor Skills*, 1970(Dec), Vol. 31(3), 1001-1002.—Emphasizes the "rhythm" of movement by using musical notations that highlight the differences between a skilled performer and a novice doing the same activity. EMGs are presented for 3 gymnasts.—*Journal abstract.*

510. Wilson, Glenn F. & Lindsley, Donald B. (U. California, Los Angeles) **Detachable lead holder for human subjects.** *Psychophysiology*, 1970(Sep), Vol. 7(2), 281-282.—Describes a simple electrode lead holder or junction box which can remain attached to an S when he leaves the experimental room for rest periods during long recording sessions. The holder connects by 1 multipin plug to the terminal board or lead-in cable. It can be secured to the S by "a paper clamp attached to clothing and connected to the holder by a short length of heavy jeweler's chain Electrode lead wires with their plug-in tips remain connected to the jacks of the holder throughout the experiment; only the multipin plug is disconnected when the S is removed from the recording situation."—*P. McMillan.*

511. Woody, Charles D., Vassilevsky, Nikolai N., & Engel, Jerome. (National Inst. of Health, Lab. of Neural Control, Bethesda, Md.) **Conditioned eye blink: Unit activity at coronal precruciate cortex of the cat.** *Journal of Neurophysiology*, 1970(Nov), Vol. 33(6), 851-864.—Unit activity was recorded in single cells of the coronal-precrucciate cortex of cats who were either naive, conditioned to blink, or whose conditioning to blink had been extinguished. The cells were grouped according to whether stimulation by means of the microelectrode produced a detectable EMG response in the orbicularis oculi muscle or not. Cells in the former category had higher thresholds to stimulation in the naive group than in the conditioned and extinguished groups. The unit activity preceded the conditioned blink by the appropriate interval.—*G. Westheimer.*

512. Yaremko, R. M., Blair, Marjorie W., & Leckart, Bruce T. (San Diego State Coll.) **The orienting reflex to changes in a conceptual stimulus dimension.** *Psychonomic Science*, 1970(Oct), Vol. 21(2), 115-116.—Recorded the GSR component of the orienting reflex for 4 groups of 12 undergraduates each. Ss were given 10 habituation trials to black on white numeric stimuli presented in seriatum. On Trial 11 an out-of-sequence test stimulus (TS) was delivered and was followed by 1 additional in-sequence number. The TS was either ± 1 or ± 11 places out of sequence. It was found that GSR magnitude to the TS was primarily a function of the amount of disparity provided by the TS, irrespective of the direction of that disparity. Dishabituation to the subsequent in-sequence stimulus was not, however, clearly present. Results are related to E. N. Sokolov's neuronal model of habituation and to previous research.—*Journal abstract.*

Electroencephalography & Evoked Potentials

513. Andreeva, V. N., Kratkin, Yu. G., & Kurbanova, Sh. (Pavlov Inst. of Physiology, Leningrad, USSR) **Vliyaniye dlitel'nosti zvukovykh signalov na analizatornyuyu deyatel'nost' mozga.** [Influence of duration of acoustic signals on cerebral analyzing

activity.] *Fiziologicheskii Zhurnal SSSR*, 1970(Sep), Vol. 56(9), 1193-1207.—Used 5 cats, with electrodes implanted in the auditory and sensorimotor cortex, the mesencephalic reticular formation at the superior collicular level, and a number of the thalamic nuclei, in a study of changes in the EEG and behavioral reactions resulting from progressive shortening of time of signal action from 3–.015 sec. Diminution of acoustic duration to .5–1 sec. had no effect on behavior, but raised the degree of tonic activation in the spontaneous EEG and prolonged cerebral electrical reactions to positive and finely differentiated stimuli. Signals of the order of .1–.2 sec. intensified EEG changes. Disturbances appeared in the effector responses: (a) prolonged afterinhibition; and (b) individual disruptions of fine differentiations, restorable by training. Duration of the order of .015–.030 sec. was extremal, resulting in (a) attainment of the highest level of tonic activation in the spontaneous EEG; (b) persistent desynchronization in response to all acoustic stimuli, even the grossly differentiated; and (c) disorganization of CR activity. Some animals maintained fine differentiation of signals of such duration, but only for the beginning of the experimental session; most retained the ability to respond only to gross differentiation; and all exhibited deep afterinhibition and incorrect reactions to negative stimuli. Continuation of experiments with sounds of extremal duration led to signs of neurosis along with trophic disturbances (bald spots, eczema). (English summary) (34 ref.).—*I. D. London*.

514. Bostock, H. & Jarvis, M. J. (University Coll., London, England) **Changes in the form of the cerebral evoked response related to the speed of simple reaction time.** *Electroencephalography & Clinical Neurophysiology*, 1970(Aug), Vol. 29(2), 137–145.—Studied the relationship between simple auditory RT and form of the cerebral evoked potential in an experiment with 18 normal 19–28 yr. old Ss. Stimuli were presented in a fixed relationship to the S's cardiac cycle, and data were analyzed separately in terms of (a) phase of cardiac cycle at which the stimulus was presented, (b) speed of RT, and (c) time in the experiment. The amplitude and latency of a wave of around 250-msec latency (N_2) were found to relate very strongly, both within and across Ss, to the speed of RT. Amplitudes of earlier components, while also related to RT, were equally or more associated with time in the experiment. The N_2 component was interpreted as an index of the moment-to-moment level of arousal. Neither the form of the evoked response nor the speed of RT was related to the phase of the cardiac cycle at which the stimulus was presented. (French summary)—*Journal summary*.

515. Childers, Donald G. & Perry, Nathan W. (U. Florida, Visual Sciences Lab.) **Alpha-like activity in vision.** *Brain Research*, 1971, Vol. 25(1), 1–20.—Attempts to relate and integrate the diverse findings from experiments covering the spectrum of psychophysical, EEG, visual evoked response, electroretinogram, ganglion cell response, and lateral geniculate body response, focusing upon responses evoked by visual stimuli. The relationship of the resonance and after-discharge phenomena to classical alpha rhythm and alpha-like activity is discussed. Various models and theoretical considerations advanced in the literature to explain these findings are considered. (101 ref.).—*Journal summary*.

516. Denisova, Z. V. & Logunova, G. I. (Inst. of Evolutionary Physiology & Biochemistry, Moscow, USSR) **Ob EEG-komponente igrovogo povedeniya**

rebenka. [On the EEG component of play behavior in the child.] *Doklady Akademii Nauk SSSR*, 1970, Vol. 195(1), 246–248.—Parieto-occipital EEG recordings were obtained from 3–7 yr. old Ss while Ss were engaged in the manipulation of toys. Changes occurred in the mean asymmetry level of EEG phases when Ss were presented with a new toy or as they discovered novel aspects of the toy (as evidenced by verbalizations). In the younger Ss, EEG changes typically took the form of "peaking" in the average asymmetry curve. With increasing age, peaking was replaced by a relative flattening on the EEG curve when novel aspects of the environment were discovered. Such flattening is also found in the adult. Behavioral data indicate that EEG changes occur not as a result of manipulatory activity as such but as a result of sensory processes, and may be present in completely immobile Ss.—*L. Zusne*.

517. Donchin, E. & Smith, D. B. (U. Illinois) **The contingent negative variation and the late positive wave of the average evoked potential.** *Electroencephalography & Clinical Neurophysiology*, 1970(Aug), Vol. 29(2), 201–203.—Stimuli that are task relevant elicit an averaged evoked potential (AEP) that shows an enhanced positive component (P300) with a peak latency between 200–300 msec. The contingent negative variation (CNV) usually terminates with a positive wave with a latency of approximately 300 msec. The possibility that these 2 phenomena are related was investigated. The data indicate that when conditions are appropriate, both the CNV and P300 can be obtained in the same experimental situation, and their relationship should be further elucidated. 10 Ss were used. (French summary)—*Journal summary*.

518. Eason, Robert G., White, Carroll T., & Bartlett, Neil. (U. North Carolina, Greensboro) **Effects of checkerboard pattern stimulation on evoked cortical responses in relation to check size and visual field.** *Psychonomic Science*, 1970(Oct), Vol. 21(2), 113–115.—Studied cortical evoked responses to checkerboard stimulation as a function of check size and visual field. Stimuli were presented to the upper, central, and lower parts of the retina of 5 Ss. Regardless of check size, largest potentials were obtained to lower-field stimulation; central-field stimulation yielded intermediate responses; and upper-field stimulation produced the smallest responses. Maximal responses were obtained to intermediate check sizes during lower-field stimulation and to the smallest checks during upper-field stimulation. Results suggest that the cortical visual system is more responsive to patterned stimuli appearing in the lower viewing field than in the upper, but that the system may be relatively more sensitive to smaller objects appearing in the upper field.—*Journal abstract*.

519. Feeney, Dennis M. (U. New Mexico) **Evoked responses and background unit activity during appetitive conditioning in dogs.** *Physiology & Behavior*, 1971(Jan), Vol. 6(1), 9–15.—In experiments with 9 mongrel dogs, the late components of both the auditory cortex response to stimulation of the medial geniculate and the visual cortex responses to stimulation of the optic radiations were enhanced at the onset of a CS for food reward and depressed later in the trial, just prior to food delivery. Tonic multiple unit activity from the optic radiations was also enhanced following CS onset and declined to a level below control prior to food delivery. The multiple unit activity from the medial geniculate showed a similar enhancement following CS onset. CS onset evoked a behavioral orienting reflex (OR) as does

stimulation of the mesencephalic reticular formation or presentation of novel stimuli. Since these procedures as well as avoidance conditioning produce similar effects on these evoked responses, it is concluded that processes not specific to a single motivational state, e.g., arousal or attention, are operating during the conditioning trial to bring about modulation of the excitability of the central auditory and visual pathways. (25 ref.)—*Journal abstract.*

520. Gerbrandt, L. K., Spinelli, D. N., & Pribram, K. H. (Stanford U., Medical School, Lab. of Neuropsychology) **The interaction of visual attention and temporal cortex stimulation on electrical activity evoked in the striate cortex.** *Electroencephalography & Clinical Neurophysiology*, 1970(Aug), Vol. 29(2), 146-155.—Describes 4 experiments with 6 adolescent rhesus monkeys, 2 of them naive, directed at finding an index of the activity of the inferotemporal (IT) cortex on the visual system. In Exp. I, electrical stimulation of the IT cortex failed to alter recovery functions in the striate cortex of 4 Ss. This result was different from that reported in an earlier experiment, but comparison of the initial recovery functions obtained in the 2 experiments allowed the discrepancy to be attributed to differences in the attentional state of the Ss. This suggestion was tested by developing, in Exp. II, a reliable measure of state in the visual system, a measure responsive to environmental variables inducing attention. This measure was used in Exp. III to select and classify recovery cycles on the basis of the state of the visual system. Only when the attentive state was present were the recovery cycles similar to those recorded in Exp. I. Finally, the measure, a potential evoked in the striate cortex by geniculate stimulation, was shown to be sensitive to IT stimulation only when Ss were in an inattentive state. (French summary) (15 ref.)—*Journal summary.*

521. Globus, Gordon G. (U. California, Irvine) **Quantification of the REM sleep cycle as a rhythm.** *Psychophysiology*, 1970(Sep), Vol. 7(2), 248-253.—Attempted to develop an objective quantitative method for representing the temporal organization of sleep in terms of the period and rhythmicity of REM sleep occurrences. Data on normative human sleep, already scored for stage REM and not stage REM, were subjected to a "binary autocorrelation." The mean period over 92 nights of sleep for 10 young adult Ss was 101.5 min. and quite stable. Data is also presented on variability of the rhythm in terms of an index of rhythmicity. Measures of temporal organization may prove to be as significant for sleep research as amount of the various sleep stages.—*Journal abstract.*

523. Maffei, L. & Campbell, F. W. (National Research Council, Lab. of Neurophysiology, Pisa, Italy) **Neurophysiological localization of the vertical and horizontal visual coordinates in man.** *Science*, 1970(Jan), Vol. 167(3917), 386-387.—Reports that the amplitude of the potential evoked by a moving grating, recorded from the occipital scalp, is less when it is oblique compared with vertical and horizontal. This inequality is not found by recording the electroretinogram (ERG). Thus, orientational effects must arise between the site of origin of the ERG and the evoked cortical response.—*Journal abstract.*

524. Numoto, Mitsuo. (U. Vermont, Medical School) **Evoked potential averager made up from laboratory instruments.** *Psychophysiology*, 1970(Sep), Vol. 7(2), 276-278.—Describes an analog averager which accumulates the signals as density changes on photographic film since the signals modulate the brightness of multiple oscilloscopic tracings. The final averaged response is graphically reproduced by a simple photoelectric densitometer made up from 2 oscilloscopes and a phototube.—*Journal abstract.*

525. Roeser, Ross J. & Price, Lloyd L. (Florida State U.) **Effects of habituation on the auditory evoked response.** *Journal of Auditory Research*, 1969(Oct), Vol. 9(4), 306-313.—The effects of habituation were determined by recording auditory evoked potentials from the intact scalp of 6 normal-hearing Ss for 3 experimental conditions, 1 requiring S to attend to the stimuli by counting each presentation. The 2 remaining conditions did not control vigilance, but signal presentation was varied. Each test session lasted a minimum of 2 hr. Complete habituation was not observed for any of the 3 conditions. There was, however, an observable decrease in response amplitude during the initial 30 min. of testing for all 3 conditions. Following the initial decrease, amplitude measures remained relatively constant. A significant difference in evoked response parameters was noted as a result of S state.—*Journal summary.*

526. Rose, Darrell E., Teter, Darre, & Curtiss, Eskel. (Mayo Clinic, ENT Section, Rochester, Minn.) **Effects of stimulus duration on the averaged acoustically evoked human cortical response.** *Journal of Auditory Research*, 1969(Oct), Vol. 9(4), 335-337.—10 young adults at 0 sensation level (SL) above voluntary threshold, and 12 more at 20- and 40-db SL, were used to examine the effects of stimulus duration (30-300 msec.) on the amplitude and latency of the component voltages of the averaged acoustically evoked response (AER) from the vertex. Duration did not affect the amplitude or latency at 20- and 40-db SL. However, energy integration existed at or near 0-db SL. Thus, it is suggested that AERs could perhaps best be elicited with a stimulus duration of not less than 200 msec.—*Journal summary.*

527. Roth, Walton T., Kopell, Bert S., & Bertozzi, Peter E. (St. Elizabeth's Hosp., Div. of Special Mental Health Research, Washington, D.C.) **The effect of attention on the average evoked response to speech sounds.** *Electroencephalography & Clinical Neurophysiology*, 1970(Jul), Vol. 29(1), 38-46.—Studied the average evoked response to prerecorded sentences and monosyllables in 10 undergraduates. EEG recordings with electrodes at the vertex and left ear were averaged with the use of trigger pulses generated synchronously at the onset of each syllable. 2 tasks were presented. In the 1st, Ss were asked to listen to or to ignore certain sentences on which they were later tested for recall. In the 2nd, they heard a list of monosyllables from which they were to distinguish nonsense from meaningful words. A crucial factor in the size of the response may have been the duration of the silence between stimuli, since the 1st syllable of each sentence was separated from the end of the previous sentence by a 3.5-sec pause, whereas the rest of the syllables were separated only by the much shorter pauses of continuous speech. Attention and nonattention conditions produced differences in the wave forms that were shown by a discrimination index based on multiple cross-correlations between wave forms to be significant.

at the .01 level. These differences were idiosyncratic to the individual S, usually appearing in the N_1 - P_2 region. Sense and nonsense words could not be distinguished by this discrimination index. (French summary)—*Journal summary*.

529. Shucard, David W., Horn, John L., & Metcalf, David. (Langley Porter Neuropsychiatric Inst., San Francisco, Calif.) **An objective procedure for the hand scoring of scalp average evoked potentials.** *Behavior Research Methods & Instrumentation*, 1971(Jan), Vol. 3(1), 5-7.—Describes a method for identifying and scoring average evoked response (AER) components. The method uses background EEG activity as a guide for visual identification of AER components. This procedure provides an advantage in objectivity and precision over most other methods, thus producing an increase in reliability and greater likelihood for interlaboratory agreement in experiments employing measures based upon the AER components.—*Journal abstract*.

530. Soliman, Salah M. (Jefferson Medical Coll.) **The auditory evoked response of mice with different brain weights.** *Journal of Auditory Research*, 1969(Oct), Vol. 9(4), 338-351.—Studied the auditory frequency sensitivity of 3 strains of laboratory mice with different brain weights using the auditory evoked response (AER) from the scalp. This method agreed with previous findings using the unconditioned GSR to map the range of frequency sensitivity of the 3 strains of mice, but disagreed as to the most sensitive frequency for 2 strains: the BALB/cj and MA/j. The AER from unanesthetized Ss consisted of a quick negative peak at a latency of 13-17 msec., followed by a positive peak at 30-40 msec., which sometimes was separable into 2 peaks only in the BALB/cj and MA/j strains, followed in turn by a negative peak at 65-95 msec. These 3 peaks were consistent in the 3 strains. Most of the BALB/cj and MA/j showed 2 further peaks at around 166 and 310 msec., respectively. Latencies of the various components were basically the same in the 3 strains, but were 3 times longer than those obtained by Ralls from mice with electrodes in the posterior colliculus. The amplitudes of the AERs from the BALB/cj and MA/j strains were larger than those from the C57BR/cdj. (15 ref.)—*Journal summary*.

531. Storm, William F. (U. Missouri, Columbia) **Vigilance, habituation, and the cortical evoked response.** *Dissertation Abstracts International*, 1970(Nov), Vol. 31(5-B), 3036-3037.

532. Woody, Charles D. (National Inst. of Health, Lab. of Neural Control, Bethesda, Md.) **Conditioned eye blink: Gross potential activity at coronal-precruciate cortex of the cat.** *Journal of Neurophysiology*, 1970(Nov), Vol. 33(6), 838-850.—Evoked potentials were recorded from the coronal-precruciate cortex of cats and the averages were compared in various states involving conditioning of blinks to a click. By comparing naive, conditioned, and extinguished states it was demonstrated that the evoked potentials in this area reflect activity related to production of the conditioned blink. Responses had a 13-msec latency, were of distinctive waveshape, and were in locations at which

motor representation of the eye blink was found by electrical stimulation.—G. Westheimer.

SENSORY PHYSIOLOGY

533. Battersby, William S. & Sturr, Joseph F. (Queens Coll., City U. New York) (Journal abstract) **Neural limitations of visual excitability: IX. Monocular and interocular changes of sensitivity during flicker stimulation.** *Journal of the Optical Society of America*, 1970(Jan), Vol. 60(1), 121-126.—Studied changes of threshold luminance for a test flash (F) as a function of temporal displacement between 2 conditioning flashes (F_1 and F_2), viewed with either the tested eye (monocular stimulation) or the homologous retinal location in the opposite eye (interocular stimulation) of 2 Os. Under both conditions, the threshold was elevated most near the beginning of F_1 , fell to a minimum between flashes, and rose again to a secondary maximum near the beginning of F_2 . The form of this function changed dramatically as the F_1 - F_2 interval decreased, the greatest effect being obtained with interocular stimulation. When a train of conditioning flashes (F_1 - F_5) at or near fusion frequency was utilized, temporal oscillations of threshold luminance were detectable with monocular but not with interocular stimulation.

534. Cervetto, L., Fiorentini, A., & Maffei, L. (Lab. di Neurofisiologia del C.N.R., Pisa, Italy) **Dynamic interactions in the retinal receptive fields and perceptual correlates.** *Archives Italiennes de Biologie*, 1970(Aug), Vol. 108(3), 485-497.—In electrophysiological studies with cats, ganglion cell response was measured when the center and periphery of the receptive field were illuminated by lights which were sinusoidally modulated either separately or simultaneously. The phase of the response depended upon the relative amplitude of the 2 lights. These results were duplicated in psychophysical studies with 2 human Ss, suggesting that "the dynamics of spatial interactions at all levels of the visual system are similar to those observed in the retinal ganglion cells."—W. A. Wilson.

540. Ross, Strange. (U. Copenhagen, Psychological Lab., Denmark) **Neural excitation and sustained sinusoidal acoustic stimulation.** *Scandinavian Journal of Psychology*, 1970, Vol. 11(4), 220-236.—On the basis of equal-loudness contours expressed in terms of volume velocity of cochlear fluid, a theory is developed for equal loudness at high levels of stimulation. At these levels the theory assumes number of active nerve fibers to be proportional to volume velocity of cochlear fluid, and firing rate of fibers to be limited by the refractory period. Analysis of a set of threshold data seems to confirm these assumptions, and is in disagreement with the theory of power summation at the absolute threshold. (15 ref.)—*Journal abstract*.

BIOCHEMISTRY

543. Curtis, George & Fogel, Max. (Eastern Pennsylvania Psychiatric Inst., Philadelphia) **Creatinine excretion: Diurnal variation and variability of whole and part-day measures: A methodologic issue in psychoendocrine research.** *Psychosomatic Medicine*, 1970(Jul), Vol. 32(4), 337-350.—The variability of creatinine excretion in 4-, 8-, and 24-hr urine samples was determined in 12 Ss. The evidence accumulated shows that creatinine excretion was much less stable than is often assumed. Some Ss were stable excretors as assessed by sequential 24-hr excretion rates, but very few were stable as assessed by sequential rates over periods of less than 24 hr. Not all within-day variability was random. Significant or highly significant diurnal variations were found in 7 of 12 Ss in the present study. (31 ref.)—*W. G. Shipman*.

544. Deguchi, Takeo. (Kyoto U., Faculty of Medicine, Japan) [On the biochemical theory of learning.] *Japanese Psychological Review*, 1969(May), Vol. 12(1), 18-29.—Reviewed recent progress in biochemical research on learning. Hydén and Egyházi reported that when a rat was trained to climb wire, the unclear RNA in Deiter's neuron cell increased and its base composition changed. Similar results were obtained in cortical neuron cell when the dexterity of the left and right side of an S was transferred. From these findings, it is suggested that specific RNA might be produced in the brain during learning. Jacobson attempted to transfer learning through injection of RNA which was extracted from the brain of a trained rat, the untrained S could perform the Skinner box experiment without prior training. Several research groups tried to observe the effects of metabolic

inhibitors on learning. According to Agranoff, intracranial injection of puromycin could erase the CR of goldfish, while Flexner reported that the direct injection of puromycin into the temporal cortex of trained rats could erase the short-term memory.—*Journal abstract*.

545. DiCara, Leo V. & Stone, Eric A. (Rockefeller U., New York, N.Y.) **Effect of instrumental heart-rate training on rat cardiac and brain catecholamines.** *Psychosomatic Medicine*, 1970(Jul), Vol. 32(4), 359-368.—To test the hypothesis that there is a difference in endogeneous levels or utilization of cardiac catecholamines between rats trained to increase and rats trained to decrease heart rate for the reward of brain stimulation, and to determine if sympathetic excitability manipulated by heart-rate training in rats has any effect on brain norepinephrine, 44 male albino Sprague-Dawley rats were rewarded by direct electric stimulation of the medial forebrain bundle in the hypothalamus for either increases or decreases in heart rate. Results showed that rats with learned increases in heart rate had higher endogeneous cardiac and brainstem catecholamine levels than rats trained to decrease heart rate, and the analysis of retention of cardiac H³-norepinephrine suggests that rats trained to decrease heart rate under curare were subjected to greater stress than rats trained to increase heart rate. 546. Frankenhauser, Marianne; Myrsten, Anna L. & Post, Birgitta. (U. Stockholm, Psychological Lab., Sweden) **Psychophysiological reactions to cigarette smoking.** *Scandinavian Journal of Psychology*, 1970, Vol. 11(4), 237-245. Studied dosage and time effects of cigarette smoking in 9 male undergraduate moderate smokers, who participated in a control condition without smoking, and in 2 experimental conditions in which they smoked either 2 weak or 2 strong cigarettes (nicotine content 1.3 and 2.3 mg cigarette, respectively) at the beginning of a 90-min period. The main effects of smoking were to increase adrenaline output, blood pressure, and heart rate, and to decrease skin temperature and hand steadiness, the changes being consistently more pronounced after the larger dose. Peak effects were recorded at the 1st trial after smoking, followed by a gradual return toward base-line levels which, however, were not reached within the 90-min period.—*Journal abstract*.

547. Gaskin, L. Z., Minsker, E. I., Orlovskaya, D. D. & Faïshchevskii, V. A. (Inst. of Psychiatry, Moscow, USSR) **K izucheniyu tsentral'nykh mekhanizmov stressovogo deistviya syvorotki krovi bol'nykh shizofreniei.** [On the study of the central mechanisms of stress-action of schizophrenic blood serum.] *Zhurnal Nevropatologii i Psikhatrii*, 1970(Apr), Vol. 70(4), 576-581. 77 rabbits were used to study. (a) the influence of the blood serum of nuclear schizophrenics on endocrine changes brought on by a standard stressor (electric current), and (b) the action of injected nuclear schizophrenic blood serum on the bioelectrical activity of the posterior hypothalamus and sensorimotor cortex. The data indicate that nuclear schizophrenic blood serum, in contrast to normal serum whose injection failed to trigger the development of a number of adaptational reactions, was capable of inhibiting the development of the stress-syndrome in the afteraction of the standard stressor. Of importance is the fact that, under these conditions, changes, accompanying the stress-state, did not occur in the functional activity of the appropriate structures of the hypothalamus, and the capacity of the

sensory regions of the brain to react to the stimulus remained intact. The facts demonstrate that nuclear schizophrenic blood serum is capable of changing hypothalamic function, thereby accounting for its inhibitory effect on endocrine adaptational reactions. (English summary)—*I. D. London.*

548. Iwahara, Shinkro & Iwasaki, Tsuneo. (Tokyo U. of Education, Japan) [Chemistry of learning.] *Japanese Psychological Review*, 1969(May), Vol. 12(1), 1-17.—Studies on major chemical substances which are assumed to be related to learning and memory, are reviewed under 3 headings: RNA; acetylcholine; and other chemicals substances, e.g., atropine, pentobarbital, serotonin, and phenylalanine. It is noted that some chemical which are believed to affect learning, are potent upon nonassociative factors, e.g., sensitivity, motivation, and activity. (5 p. ref.)—*Journal abstract.*

549. Kolpakov, V. G. & Galaktionov, O. K. (Inst. of Cytology & Genetics, Novosibirsk, USSR) *Genetiko-biohimicheskoe issledovanie audigennoi epilepsii: III. Sravnitel'noe issledovanie biohimicheskikh mekhanizmov audigennoi epilepsii u krysi linii Krushinskogo-Molodkinoi i u myshei linii DBA*. [Genetico-biochemical study of audiogenic epilepsy: III. Comparative study of the biochemical mechanisms of audiogenic epilepsy in rats of the Krushinskii-Molodkina strain and in mice of the DBA strain.] *Genetika*, 1970(Dec), Vol. 6(12), 63-71.—Oxidative phosphorylation and glutamylsynthetase (GS) in the brain were comparatively investigated in sound-sensitive Krushinskii-Molodkina (K-M) rats and Wistar rats and also in convulsive DBA mice and sound-resistant C57BL mice. Adenosine triphosphate level in K-M rats was lower, while adenosine monophosphate level was higher, in comparison with respective levels in Wistar rats. A decrease in GS activity and a statistically insignificant decrease in Na-K-activated adenosine triphosphatase activity were noted. GS activity was lower in both the brain and liver of DBA mice as compared to that in C57BL mice at both epileptic and nonepileptic ages. Despite a difference in the primary hereditary mechanisms involved, the immediate biochemical changes, which result in predisposition to audiogenic seizure in rats, were similar to those in mice. (English summary) (35 ref.)—*I. D. London.*

550. Ley, K. F. & Corson, J. A. (McGill U., Montreal, Quebec, Canada) *Effects of ACTH and zinc phosphate vehicle on shuttlebox CAR*. *Psychonomic Science*, 1970(Sep), Vol. 20(5), 307-309.—Conditioned avoidance responding of Ss receiving subcutaneous injections of ACTH, zinc phosphate vehicle, and physiological saline was studied in the 2-way shuttlebox at 3 UCS intensity levels. In no case did ACTH Ss differ significantly from saline control Ss, but the zinc phosphate vehicle was found to alter performance both during acquisition and extinction. 48 and 20 male Wistar rats were used in 2 experiments, respectively. 552. Brain, Paul F., Nowell, Norman W., & Wouters, Angela. (U. Sheffield, England) *Some relationships between adrenal function and the effectiveness of a*

period of isolation in inducing intermale aggression in albino mice. *Physiology & Behavior*, 1971(Jan), Vol. 6(1), 27-29.—Because an inverse relationship has often been demonstrated between aggressiveness and adrenal function in rodents, a series of experiments, in which manipulations of the pituitary/adrenal axis were carried out, was undertaken to determine whether this had any modulating influence on fighting behavior. The effects are described of adrenalectomy, dexamethasone blocking of the pituitary, and of ACTH injection on isolation-induced aggression in 60 immature, naive or mature, sexually experienced male Tuck albino TT strain mice. It was found that while adrenalectomy reduced aggression, dexamethasone blocking enhanced it, and ACTH injection reduced it, although the differences were not always significant. The possible mode of action of ACTH in reducing aggression and the consequences to natural populations of rodents is discussed. (17 ref.)—*Journal abstract.*

553. Glick, Zvi; Thomas, Donald W., & Mayer, Jean. (Harvard U., School of Public Health, Boston) *Absence of effect of injections of the intestinal hormones secretin and cholecystokinin-pancreozymin upon feeding behavior*. *Physiology & Behavior*, 1971(Jan), Vol. 6(1), 5-8.—Describes 2 experiments with 29 female Charles River CD rats. In a search for gastrointestinal hormones involved in the regulation of food intake, the intestinal hormones secretin and cholecystokinin-pancreozymin were injected via chronic ip and intra-aortal catheters prior to meals taken by fasted Ss, and at the initiation of each spontaneous meal of Ss fed ad lib. In no case did these injections have an effect upon feeding behavior. (17 ref.)—*Journal abstract.*

554. Poe, Richard O., Rose, Robert M., & Mason, John W. (45 Trenton Place, San Mateo, Calif.) *Multiple determinants of 17-hydroxycorticosteroid excretion in recruits during basic training*. *Psychosomatic Medicine*, 1970(Jul), Vol. 32(4), 369-378.—To test the hypothesis that the pituitary adrenal system responds to environmental stimuli other than psychologic ones by defining the effect of psychologic and other variables on 17-hydroxycorticosteroid (17-OHCS) excretion, a mean 17-OHCS level was obtained for 46 Ss, plus a rating of how effectively each was coping with psychologic stress. Individual interviews, observations, and the MMPI were used as ratings. Results suggest that an individual's 17-OHCS level is influenced by psychologic, biologic, historic, and environmental variables. (27 ref.)—*W. G. Shipman.*

555. Rodier, William I. (U. Virginia) *Progesterone-estrogen interactions in the control of activity-wheel running in the female rat*. *Journal of Comparative & Physiological Psychology*, 1971(Mar), Vol. 74(3), 365-373.—Progesterone injections (8 mg/kg/day or larger) resulted in decreased wheel-running activity and an increased rate of body weight gain in 7 female Sherman albino rats. These changes were evident from comparison to previous base-line determinations and to controls. Injections of progesterone (40 mg/kg/day) into 11 ovariectomized Ss had no effect on these measures. Progesterone injections (16 mg/kg/day or larger) were effective in causing decreased activity and increased body weight when administered to 7 ovariectomized Ss receiving estradiol cyclopentylpropionate. Results indicate that progesterone can influence wheel running and body weight through a direct interaction with estrogen, possibly by interfering with the effects of

estrogen on these measures. (21 ref.)—*Journal abstract.*

556. Sandman, Curt A., Kastin, Abba J., & Schally, Andrew V. (Louisiana State U., Medical School, Baton Rouge) **Behavioral inhibition as modified by melanocyte-stimulating hormone (MSH) and light-dark conditions.** *Physiology & Behavior*, 1971(Jan), Vol. 6(1), 45-48.—Administered melanocyte-stimulating hormone (MSH) or a control solution to 50 male albino rats tested with a passive avoidance response (PAR) at the peak (1 hr. after dark) and lowest (in the middle of the light period) level of activity. MSH treatment significantly inhibited the PAR in the dark period. For all Ss, inhibition of response was intricately related to phase of activity. This implies an effect on memory and/or the expression of fear. (27 ref.)—*Journal abstract.*

557. Strutt, George F. & Stewart, Charles N. (Franklin & Marshall Coll.) **The effect of ACTH administration upon activity-related self-starvation.** *Psychonomic Science*, 1970(Sep), Vol. 20(5), 301-302.—32 male Sprague-Dawley rats lived on a 23-hr food-deprivation schedule. 2 experimental groups lived in activity wheels while 2 control groups lived in laboratory cages. 1 experimental and 1 control group received subcutaneous injections of ACTH, while the other 2 groups received injections of physiological saline. The ACTH injection had no effect on the self-starvation phenomenon, and the results are in opposition to the hypothesis of adrenocortical involvement in the phenomenon.—*Journal abstract.*

Drug Effects—Human

558. Cleghorn, J. M., Peterfy, G., Pinter, E. J., & Pattee, C. J. (McMaster U., Hamilton, Ontario, Canada) **Verbal anxiety and the beta adrenergic receptors: A facilitating mechanism?** *Journal of Nervous & Mental Disease*, 1970(Oct), Vol. 151(4), 266-272.—Subjected 6 healthy female Ss to mildly stressful hypnotic suggestions on 6 occasions. During 3 of the trials on each S the beta adrenergic blocking agent propranolol (nderal) was administered. Anxiety levels in recorded speech were measured during each experiment, and changes in plasma free fatty acids were estimated as an indication of beta receptor activation. Results indicate that beta adrenergic blockade with propranolol had no inhibiting effect on psychological anxiety in healthy Ss when an operational measure of anxiety was used, and where bodily symptoms were absent. There is little evidence that the beta receptors participate in a subliminal feedback system which facilitates anxiety, but bodily sensations of anxiety states are believed to intensify psychological anxiety. (32 ref.)—*Journal abstract.*

559. Gupta, B. S. (Government Coll., Kurukshetra, India) **The effect of extraversion and stimulant and depressant drugs on verbal conditioning.** *Acta Psychologica, Amsterdam*, 1970(Dec), Vol. 34(4), 505-510.—Examined the effect of extroversion, dextedrine, and phenobarbitone on verbal conditioning. 90 graduate and postgraduate students served as Ss. Ss were randomly assigned to 3 treatments (stimulant, depressant, and placebo) and 3 extroversion groups (high, average, and low). A 3 × 3 factorial design was replicated 10 times. The technique of sentence completion was used. Results support the following conclusions: (a) introverted Ss are more conditioned than extroverted Ss; (b) dextedrine facilitates and phenobarbitone retards the conditioning process; (c) dextedrine does not improve the

conditioning level of introverted Ss; and (d) variability tends to increase under the influence of drugs. (25 ref.)—*Journal abstract.*

Oklahoma, Medical Center, Oklahoma City) **Dissociate effects of ethyl alcohol.** *Psychonomic Science*, 1970(Sep), Vol. 20(6), 342-343. —Demonstrated that alcohol has dissociative properties in a negative transfer task but not in a relearning task. 40 male undergraduates were Ss. In addition, alcohol was shown to retard the rate of acquisition of new learning.—*Journal abstract.*

568. Weingartner, Herbert; Snyder, Solomon H., Failace, Louis A., & Markley, Herbert. (Johns Hopkins U.) **Altered free associations: Some cognitive effects of DOET (2,5-dimethoxy-4-ethylamphetamine).** *Behavioral Science*, 1970(Jul), Vol. 15(4), 297-303. —Administered DOET (2,5-dimethoxy-4-ethylamphetamine) and d-amphetamine to 10 21-35 yr. old normal males at 2 separate times in a double-blind experimental design. DOET in low doses (1.5 mg/70 kg) produced no gross behavioral or perceptual changes. DOET did, however, alter Ss' free associations at the time of maximal drug uptake. Ss produced lower frequency, less common, free associations with DOET. Although these associations occur less frequently in association norms, they were neither bizarre nor idiosyncratic responses. Also, these associations were at least as reproducible as the associations produced under no drug or amphetamine conditions. This new psychotropic agent, in low doses, appears to be particularly effective in altering normal cognition without producing disorganization in thinking or perception.—*Journal abstract.*

Drug Effects—Animal

569. Baru, A. M. & Bozhko, G. Kh. (Research Inst. of Neurology & Psychiatry, Kharkov, USSR) **Vliyanie nekotorykh inhibitorov i metabolitov obmena katekholaminov na protsessy zakrepleniya i vosproizvedeniya "sledov pamyati."** [*Influence of some inhibitors and metabolites of catecholamine metabolism on the processes of reinforcement and reproduction of "memory traces."*] *Byulleten' Eksperimental'noi Biologii i Meditsiny*, 1970(Sep), Vol. 70(9), 45-48.—80 white rats were used to study the synthesis and transformation of catecholamines (CAs) in the formation and reproduction of the conditioned avoidance response (CAR; an electrodeless reaction in response to an auditory signal as CS), where the CAR is viewed as an experimental model for elucidation of the "biomechanisms of memory." CA synthesis was blocked by 50 mg/kg ip injected disulfiram, which blocked dopamine- β -oxidase. 100 mg/kg subcutaneously injected iprazid blocked CA transformation through deamination. 50 mg/kg subcutaneously injected 3,4-dimethoxyphenylethylamine (DMPEA) was competitive with respect to the CAs. Reproduction of the CAR was attempted 10 min. and 1-72 hr. after injections. Formation of the CAR was attempted following iprazid and DMPEA administration. Disulfiram blocked the synthesis of noradrenaline and sharply inhibited the CAR—an effect which may be prevented by the prior administration of the MAO inhibitor, iprazid, which also exerted a stimulatory effect on formation of the CAR in

animals resistant to learning. Chronic administration of DMPEA impeded the formation of the CAR and inhibited previously developed and stabilized CARs; with single administration it was capable of inhibiting only the initial stages of CAR formation. The data point to a possible role of the CAs in the neurochemical organization of "memory traces." (English summary)—*J. D. London.*

570. Besson, J. M. & Abdelmoumene, M. (Physiological Lab. of Nervous Centers, Faculty of Sciences, Paris, France) **Modifications of dorsal root potentials during cortical seizures.** *Electroencephalography & Clinical Neurophysiology*, 1970(Aug), Vol. 29(2), 166-172.—Studied variations, during epileptic seizures, of presynaptic inhibition, as indicated by the dorsal root potential (DRP) in 14 adult cats. Findings were that (a) metrazol administration causes a series of spontaneous DRPs in addition to the classical electrocortical paroxysm. These DRPs are abolished by spinal section at C1, showing that they are of supraspinal origin. (b) When the paroxysmal effects of metrazol are over, there is a reduction in segmental phenomena but a large increase in those of heterosegmental, heterosensory, and cortical origins. (c) Spinal section at C1 confirms that metrazol has a dual effect on the presynaptic control of transmission in afferent pathways; presynaptic inhibition of local origin is depressed while that of central origin is augmented. (d) The above series of effects is also found during epileptic seizures induced by means other than metrazol administration. The origin of heterosegmental DRPs is discussed. A mechanism for metrazol action is proposed involving a possible duality, functional or structural, in the mechanisms generating peripheral and central presynaptic inhibition. (French summary) (28 ref.)—*Journal summary.*

571. Bliss, Eugene L. & Aillon, Janie. (U. Utah, Medical School) **The effect of lithium upon brain neuroamines.** *Brain Research*, 1970, Vol. 24(2), 305-310.—Fed male Sprague-Dawley rats 175-250 mg. lithium carbonate in their chow for 14 days. Plasma levels of lithium of .5-1 meq/l were attained. Under these conditions, no alterations from controls could be demonstrated in either the absolute levels of brain norepinephrine, serotonin, and dopamine; or in the rate of metabolism of these neuromediators. Results suggest that lithium may produce its therapeutic effects through means other than the general modulation of these systems in brain.—*Journal summary.*

572. Borodkin, Yu. S. (Inst. of Experimental Medicine, Leningrad, USSR) **Neirofizilogicheskie osnovy sudorozhnogo deistviya nikotina.** [*Neurophysiological bases for the convulsant action of nicotine.*] *Farmakologiya i Toksikologiya*, 1970(Jul), Vol. 33(4), 400-404.—50 rabbits under conditions of acute experiment (whole brain, cerveau isolé, premenencephalic section) were used to study the role of the limbic structures and other formations involved in intracranial regulation of the convulsant action of nicotine. It was established that .26-.5 mg/kg nicotine, while exciting the cholinergic system of the reticular formation, enhanced the activity of the caudate nucleus, the cortex of the cerebral hemispheres and septal region, along with simultaneous blockade of the hippocampus, the nuclei of the amygdaloid complex and of the thalamocortical projection system. In large doses (1-2 mg/kg) nicotine exerted a direct exciting effect on the structures of the diencephalon and forebrain. The hippocampus is the

locale for the formation of epileptiform discharges when nicotine is injected in convulsant dosage. Generalization of the convulsant reaction, induced by nicotine, took place only when the connections between the mesencephalic reticular formation and the limbic structures were intact. The convulsant effect of nicotine appeared only when the functional activity of the cerebral cortex was preserved. (English summary)—*I. D. London.*

573. Bukharova, I. K., Syrkin, A. B., & Bodyagin, D. A. (Inst. of Experimental & Clinical Oncology, Moscow, USSR) *Nekotorye farmakologicheskie svoistva fluorodopana.* [Some pharmacological properties of fluorodopane.] *Farmakologiya i Toksikologiya*, 1970(Sep), Vol. 33(5), 602-606.—Mice, rats, and rabbits were used to study the action of a new antitumor preparation, fluorodopane: 4-methyl-5-(2-fluorethyl-2'-chloroethyl) aminouracil, in doses somewhat higher than the therapeutic. Administration of hypnotics and convulsants after maximally tolerated doses of fluorodopane revealed no essential changes in the functional level of the nervous system.—*I. D. London.*

574. Cabibbe, F. (U. Milan, Inst. of Clinical Psychiatry, Italy) *Alcuni aspetti del metabolismo del triptofano in ratti trattati con carbonato di litio.* [Some aspects of the metabolism of tryptophan, in rats treated with lithium carbonate.] *Acta Neurologica*, 1969(Jul), Vol. 24(4), 557-560.—Compared the metabolism of tryptophan with antidepressant and neuroleptic drugs and with lithium carbonate. White rats were given lithium for 4 wk. The maximum level of lithium was reached $\frac{1}{2}$ hr. after the injection, while after 3 hr. lithium was no longer measurable in the blood. Lithium appears to have the same action as neuroleptic and antidepressants. However, lithium accelerates the metabolism of tryptophan in the serotonin and nicotinic pathways. Opposite results occur with neuroleptic and antidepressive type drugs. (English summary)—*A. M. Faraglia.*

575. Calhoun, William H., Smith, Allan A., & Bauer, Robert. (U. Tennessee) *Scopolamine's effect on passive avoidance.* *Psychonomic Science*, 1970(Nov), Vol. 21(3), 165-166.—Compared performance on active and passive retention tests of mice. 19 out of 58 male ICR mice received scopolamine prior to a single passive-avoidance training trial. Controls performed well with either retention test procedure, while the scopolamine group performed well for the active test but poorly for the passive test. Drug effects on memory and behavior are discussed. *Journal abstract.*

576. Capaldi, E. J. & Sparling, Daniel L. (Purdue U.) *Amobarbital and the partial reinforcement effect in rats: Isolating frustrative control over instrumental responding.* *Journal of Comparative & Physiological Psychology*, 1971(Mar), Vol. 74(3), 467-477. Each of 3 runway investigations contained 2 partial reinforcement (PRF) groups of female albino Holtzman rats. Extinction was preceded by injections of either amobarbital or saline. In acquisition injections of amobarbital preceded nonrewarded trials followed by rewarded trials in 1 PRF group and rewarded trials followed by nonrewarded trials in the other PRF group. Only the latter group showed a PRE in saline extinction. Both PRF groups showed a PRE in amobarbital extinction. Saline extinction was little affected by prior amobarbital extinction. Results isolate and identify the PRE trials on which frustration acquires control over the instrumental

reaction and suggest that nonreward occasions conditionally neutral stimuli which can sustain a PRE. (2 ref.)—*Journal abstract.*

578. De Ruiter, L. & Wiepkema, P. R. (State U. Groningen, Netherlands) *The goldthiogluucose (GTG) syndrome in mice.* *Psychiatry, Neurologia, Neurochirurgia*, 1969(Sep), Vol. 72(5), 455-480.—Ethological analysis of behavior results in classification of its elements of behavior into relatively distinct, but interacting behavior systems. The physiological mechanisms of mammalian feeding behavior are briefly discussed. This discussion exemplifies that to explain normal occurring fluctuations in the tendency of an individual to perform a given behavior, account must be taken of changes in the state of the machinery for that behavior and the mechanism of systems with which it interact. Similarly, disturbance of a given behavior may stem from either or both of these causes. The potentialities of this approach are illustrated by a discussion of behavioral abnormalities induced in male mice by injection of GTG. Evidence is presented that the GTG-syndrome may be due to combined effects of injury to the mechanisms of several different behavior systems. In addition the behavioral instability of the GTG syndrome is tentatively ascribed to disturbed interaction between systems. The relative stability of normal behavior is probably due to combined action of within-system positive feedback and reciprocal inhibitory relations between behavior systems. 581. Goff, W. R., Allison, T., & Matsumiya, A. (Veterans Administration Hosp., West Haven, Conn.) *Effects of convulsive doses of 1,1-dimethylhydrazine on somatic evoked responses in the cat.* *Experimental Neurology*, 1970(May), Vol. 27(2), 211-226. Studied the effects of convulsive doses of 1,1-dimethylhydrazine (UDMH) on somatosensory evoked responses (ERs) in 11 cats with chronically implanted electrodes in n. ventralis posterolateralis, in primary somatic cortex (SI), and cerebellar cortex. Stimulation was either to ulnar nerve or to thalamocortical afferent fibers. EEG recordings were made from cerebral cortex and hippocampus. IP administration of UDMH resulted in a small, inconstant increase of the primary positive ER. The enhancement of cortical ERs prior to a seizure was due to increased excitability of superficial cortical layers. The 1st 2 waves of the cerebellar ER were unaffected by UDMH, while the 3rd wave was depressed prior to seizures. Results are consistent with previous suggestions that UDMH and other hydrazines block production of gamma-aminobutyric acid. The large, consistent increase of SI negative response amplitude prior to seizures is discussed for possible applications. *Neurochemical studies of convulsive agents and epilepsies.* (38 ref.)—*Journal abstract.*

difference in the neuropharmacological study on behavior was emphasized. The hypothesis concerning the dreaming mechanism—"dreaming as a CR in sleep"—was introduced. (3 p. ref.)—*Journal abstract.*

590. Matveev, V. F. (Moscow Medical Stomatological Inst., USSR) *Patomorfologicheskie izmeneniya v golovnom mozge eksperimental'nykh zhivotnykh pri khronicheskoi intoksikatsii lizergamidom.* [Pathomorphological changes in the brain of experimental animals in chronic intoxication with lysergamide.] *Zhurnal Nevropatologii i Psikiatrii*, 1970(Dec), Vol. 70(12), 1856-1862.—Ss were 100 3-mo-old white rats. Daily im dosage of lysergamide was 40 µg/kg for 1 mo., with decapitation in lots of 20 at intervals of 1, 2, 3, and 4 wk. (20 controls) for purposes of histological examination. Within 5-10 min. after the administration of lysergamide, a sharp increase occurred in motor activity, reactions to external stimuli, and muscular tonus. With continuing intoxication, a developing apathy, somnolence, and motor inhibition started to take over by the 7th-8th day, intensifying until the end of the experiment. It was established that in the course of intoxication a toxico-organic process developed in the brain as a result of which the death of both individual cells and also whole cellular groups took place. Most changes were observed in the neurons of the cortex, thalamus, and hypothalamus (acute swelling of the cytoplasm and nuclei, followed by chromatolysis, cytoplasmic vacuolization, and cytolysis). Electron microscopic examination provided evidence of the suppression of interneuronal activity, disturbance of intracellular metabolism of DNA and RNA, inhibition of astrocytic and microglial reactions, and changes in the vessels of the brain. 591. McKim, W. A. (U. Western Ontario, London, Canada) *The effects of scopolamine on the extinction of a continuously reinforced response.* *Psychonomic Science*, 1970(Sep), Vol. 20(5), 281-282.—Injected 35 male Long-Evans hooded rats with varying doses of scopolamine, methyl scopolamine, and saline before extinction of a continuously reinforced response. Methyl scopolamine and low doses of scopolamine speeded extinction, whereas higher doses of scopolamine led to responding similar to that of saline controls. It is suggested that the relatively weak tendency to respond after CRF training and the drastic switch to extinction from CRF maximized the disruptive peripheral effects of scopolamine, and as a result higher doses were required to show prolongation of extinction.—*Journal abstract.*

595. Scheel-Krüger, J. (Royal Veterinary & Agricultural Coll., Copenhagen, Denmark) *Central effects of anticholinergic drugs measured by the apomorphine gnawing test in mice.* *Acta Pharmacologica et Toxicologica*, 1970, Vol. 28(1), 1-16.—Induced weak gnawing behavior in female albino mice with a subcutaneous injection of 10-60 mg/kg of apomorphine. 10 mg/kg was without effect. The addition of anticholinergic drugs given 15 min before 10 mg/kg apomorphine potentiated the gnawing behavior. 9 tertiary and 3 quaternary drugs were tested. Among these some quinuclidinylesters, scopolamine, and benzotropine were found to be very active compared with atropine. The quaternary compounds showed much weaker activity than the corresponding tertiary analogs. The gnawing activity produced by atropine plus apomorphine was only weakly antagonized by the apomorphine antagonistic drug spiramide, physostigmine showed a better inhibitory effect, and combined treatment with spiramide and physostigmine gave a pronounced antagonistic effect. Since the apomorphine gnawing behavior is most probably related to an interaction with central dopamine receptors, findings suggest there is a central counter balancing dopaminergic-cholinergic system. 600. Vikhlyayev, Yu. I., Dzhagatspanyan, I. A., & Klygul', T. A. (Inst. of Pharmacology, Moscow, USSR) **Eksperimental'naya kharakteristika osobennosti razvitiya tolerantosti k diazepamu i khloridiazepoksidu.** [Experimental characteristics of the features specific to the development of tolerance to diazepam and chlordiazepoxide.] *Zhurnal Nevropatologii i Psikiatrii*, 1970(Dec), Vol. 70(12), 1867-1872.—White mice and rats were used to study the development of tolerance to diazepam (seduxen, valium) and chlordiazepoxide (elenium, librium, napoton) with a view toward evaluation of the different forms of their action (tranquilizing, sedative, anticonvulsive, activating, myorelaxant, and lethal effects), resulting from prolonged administration of these drugs. Tolerance developed markedly with respect to the myorelaxant, sedative, and anticonvulsive action of the drugs. The uneven development of tolerance, as a result of prolonged usage, with respect to the different forms of action may be connected with the fact that several mechanisms may be basically involved in the action of these tranquilizers. (English summary) (18 ref.)—*I. D. London*.

601. Watts, M. E. & Mark, R. F. (Monash U., Clayton, Victoria, Australia) **Separate actions of ouabain and cycloheximide on memory.** *Brain Research*, 1971, Vol. 25(2), 420-423.—Compared the effects of ouabain (sodium pump inhibitor) and cycloheximide (protein synthesis inhibitor) on short-term memory in 1-day-old cockerels. Memory was tested 10, 30, 60, and 90 min. after a learning trial. Both drugs caused memory decay. The rate of memory loss with ouabain became faster with increasing doses of the drug, while with cycloheximide a maximum rate was reached which could not be increased by increasing the dosage. It is suggested that the drugs interfere with memory at successive stages, "that memory begins with a membrane store of limited time-span involving ionic metabolism and that this is soon supplemented by a process dependent on synthesis of proteins which perhaps alter synaptic properties."—*S. Knapp*.

602. Wike, Edward L. & Chen, Jaw-Sy. (U. Kansas) **Runway performance and reward magnitude.** *Psychonomic Science*, 1970(Nov), Vol. 21(3), 139-140.—Investigated the training, extinction, and retraining

performance of 3 groups of 10 naive female Holtzman albino rats with large (11 45-mg) rewards, small (45-mg) rewards, and small (45-mg) rewards with intertrial feedings (10 45-mg) in a runway. Results are in accord with the generalization that asymptotic performance is directly related to the magnitude of reward and differed from results recently reported by G. McCain (see PA, Vol. 44:16241).—*Journal abstract*.

603. Witters, Weldon L. & Foley, C. W. (Ohio U.) **Effects of agroclavine on wheel-turning activity in mice.** *Psychonomic Science*, 1970(Nov), Vol. 21(3), 175-176.—Injected 25 male Swiss Webster mice with 0, 30, 90, 270, or 810 mg/kg body weight of agroclavine, a drug chemically similar to LSD. Over 5 consecutive days smaller dosage levels either enhanced or produced little change in wheel-running activity, while higher dosages produced a decrement.—*Journal abstract*.

604. Ziff, D. R. & Capaldi, E. J. (Purdue U.) **Amytal and the small trial partial reinforcement effect: Stimulus properties of early trial nonrewards.** *Journal of Experimental Psychology*, 1971(Feb), Vol. 87(2), 263-269.—Gave following limited acquisition training in the runway (3 or 6 trials), 5 groups of 12 naive male albino Holtzman rats each 12 extinction trials. 4 of the groups received large reward (.81 gm.) and comprised a 2 × 2 factorial combining amytal or saline in acquisition with partial or continuous reinforcement. A 5th group received small partial reinforcement (.09 gm.) under saline. All groups were extinguished without amytal or saline. Amytal trained groups ran faster in acquisition but slower in extinction. A PRE was obtained following amytal which was as large as that obtained following saline (absence of a Drug × Schedule interaction). Large partial reward (saline) produced greater resistance to extinction than small partial reward. It is suggested that the present results are more consistent with a conditioning than with a nonconditioning model of small trial phenomena. (21 ref.)—*Journal abstract*.

605. Zoryan, E. V. (Moscow Medical Stomatological Inst., USSR) **Osobennosti deistviya izoprotana v kombinatsii s amidopirinom.** [Features characterizing the action of isoprotane in combination with amidopyrine.] *Farmakologiya i Toksikologiya*, 1970(Sep), Vol. 33(5), 518-521.—White rats and rabbits were used to study the joint pharmacological action of 25-100 mg/kg isoprotane (carisoprodol) and 100 mg/kg amidopyrine, the former chemically close to meprobamate but possessing, in contradistinction to its relative, analgesic properties. The following were investigated: (a) sensitivity to pain, as determined by mechanical and electrical stimulation of the tail in white rats and electrical stimulation of the tooth in rabbits; (b) myorelaxant action, gauged by response to rotation; and (c) influence on higher nervous activity, utilizing defensive CRs in rats. When used together, analgesic action was higher than when used separately. Amidopyrine diminished the myorelaxant properties of isoprotane and its influence on sleep, induced by hexenal (hexobarbital) and chloral hydrate.—*I. D. London*.

CARDIOVASCULAR PROCESSES

606. Buck, Ross W., Miller, Robert E., & Caul, William F. (U. Pittsburgh, Medical School) **Heart rate and skin conductance responding during three attention-direction tasks under distraction conditions.** *Psychonomic Science*, 1970(Sep), Vol. 20(6),

355-357. Investigated the possibility that a failure to find cardiac acceleration to an environmental rejection task in a study by R. Buck, R. E. Miller, and W. F. Caul (see PA, Vol. 43, 7467) was due to insufficient distraction in the experimental situation. The study was replicated, with distracting events added. An environmental intake task was associated with heart-rate deceleration during the 1st 60 sec. Ss were 18 paid male undergraduates. The rejection task and a 3rd task involving attention to bodily events were not associated with significant heart-rate change. There were no differences in skin-conductance responding to the 3 tasks.—*Journal abstract*.

610. Jennings, J. Richard; Averill, James R.; Opton, Edward M., & Lazarus, Richard S. (U. California, Berkeley) Some parameters of heart rate change: Perceptual versus motor task requirements, noxiousness, and uncertainty. *Psychophysiology*, 1970(Sep), Vol. 7(2), 194-212.—Investigated sensorimotor integration and physiological patterns in a modified RT task with 30 male 18-28 yr. old students. Following a ready signal, 1 of 2 discriminative signals indicated that a right or left reaction was to be made to a go signal. For 1 group, the discriminative and go signals occurred simultaneously; for another group, the go signal was delayed 10 sec. In different sessions, shock occurred with the discriminative signal on 0, 33, or 100% of the trials. The basic pattern of heart rate response was the same in all conditions, i.e., acceleration followed by deceleration immediately prior to the discriminative and go signals. All experimental manipulations appeared to contribute to cardiac deceleration; e.g., the greatest decrease occurred prior to the simultaneous discriminative-go signal with 33% shock probability. The least deceleration (and fastest RTs) occurred to the delayed go signal. Anticipation of a motor response and/or shock also accentuated the accelerative limb of the heart rate curve, as well as producing increased skin conductance. Muscle action potentials from the chin showed an equivocal relationship to cardiac acceleration (or less deceleration) and to faster RTs. Results are discussed in terms of an attentional hypothesis, and their relevance to speculations by J. I. Lacey and P. A. Obrist is examined. (21 ref.)—*Journal abstract*.

613. Nowlin, John B., Eisdorfer, Carl; Whalen, Robert, & Troyer, William G. (Duke U., Medical Center) The effect of exogenous changes in heart rate and rhythm upon reaction time performance. *Psychophysiology*, 1970(Sep), Vol. 7(2), 186-193.—Examined the influence of different heart rates (HRs) and rhythm on RT performance in 2 groups of experimental Ss, HR in 1 group being varied by atrial pacing and in the other by ventricular pacing. A mixed preparatory interval series of visual RT trials was employed, with preparatory interval durations of 3, 4, and 5 sec. Study I Ss (10 male 37-46 yr. old patients), exposed to atrial pacing in a cardiac catheterization laboratory immediately before coronary artery cineangiography, demonstrated no change in RT response with the pacing situation when HR was 115 bpm. Response speed was most rapid with the 5-sec preparatory interval, slowest with the exposure to an exogenously-induced tachycardia. Presentation 1st of a variable paced tachycardia following a regular tachycardia was associated with slightly prolonged times in both situations, as compared to RT produced with the reverse order of pacing presentation. These differences were not statistically significant. Presence or absence of cineangiographic evidence or coronary arteriosclerosis within Study I exerted no effect on RT performance. Study II Ss (4 58-64 yr. old patients), paced with an external (Chardack) pacemaker in a quiet laboratory environment, confirmed results obtained from Study I. Data suggest that the level of background HR is unimportant as a determinant of RT response.—*Journal abstract*.

ENVIRONMENT & STRESS

619. Eason, Robert G. & Dudley, Linda M. (U. North Carolina, Greensboro) **Physiological and behavioral indicants of activation.** *Psychophysiology*, 1970(Sep), Vol. 7(2), 223-232.—Demonstrated that various central and peripheral physiological variables are similarly altered by experimentally induced changes in activation while being dissimilarly altered during the course of a trial by unknown factors, i.e., both general and specific physiological changes are demonstrated in a single experiment. Activation level was experimentally altered by having 6 male graduate students (a) react to light flashes under threat of shock, (b) react to flashes without any such threat, and (c) passively observe light flashes. Evoked cortical potentials, heart rate, skin conductance, and muscular tension were similarly affected by these conditions, but the variables showed differential changes over time. It is concluded that these physiological processes simultaneously reflect both generalized arousal and directionally fractionated activity. (21 ref.)—*Journal abstract.*

620. Elliott, Ruth A. (U. Maine) **Some anatomical and behavioral effects of environmental enrichment on genetically heterogeneous mice selectively bred for high and low brain weight.** *Dissertation Abstracts International*, 1970(Oct), Vol. 31(4-B), 2302-2303.

621. Leshner, Alan L., Collier, George H., & Squibb, Robert L. (Bucknell U.) **Dietary self-selection at cold temperatures.** *Physiology & Behavior*, 1971(Jan), Vol. 6(1), 1-3.—24 male albino Sprague-Dawley rats, housed in the cold (2°C), were given the opportunity to select the components of their diets from protein and carbohydrate fractions. Housing in the cold was accompanied by depressed growth, which was not affected by giving Ss the opportunity to select their diets. Ss in the cold increased total caloric intake relative to controls at room temperature (22°C). Selecting Ss housed in the cold

chose a lower percentage of the diet as protein (and, therefore, a higher percentage as carbohydrate) than did controls. Since protein intake levels did not differ as a function of environmental temperature, the altered dietary selection pattern was due to an increase in the absolute amount of carbohydrates consumed. Data suggest that the level of protein selected is determined by age factors and the level of carbohydrate selected is determined by energy requirements.—*Journal abstract.*

623. Maltzman, Irving; Smith, Manual J., Kantor, William, & Mandell, Mary P. (U. California, Los Angeles) **Effects of stress on habituation of the orienting reflex.** *Journal of Experimental Psychology*, 1971(Feb), Vol. 87(2), 207-214.—Gave 10 Ss a series of different innocuous visual and auditory stimuli in a session at the beginning and again at the end of the academic quarter. For 1/2 of the Ss, graduate students, the 2nd session preceded a final oral examination for a seminar in which they were enrolled. For the remaining Ss, undergraduate students, the 2nd session was simply a repetition of the 1st. Measures of the GSR and cephalic vasomotor activity obtained during the habituation and oral examination sessions were taken as indices of phasic and tonic orienting and defense reflexes. Undergraduates showed slower habituation of the GSR and smaller pulse widths than graduates during the 1st habituation session. In the 2nd habituation session, graduates showed slower habituation of the GSR and smaller pulse widths than the undergraduates. These Group \times Sessions interactions suggest that habituation of the orienting reflex is influenced by the arousal state of the individual and by parameters of the physical stimulus.—*Journal abstract.*

624. Paré, William P. (Veterans Administration Hosp., Perry Point, Md.) **Six-hour escape-avoidance work shift and production of stomach ulcers.** *Journal of Comparative & Physiological Psychology*, 1971(Mar), Vol. 74(3), 459-466.—Studied 16 male Long-Evans rats in each of 6 experiments in which they could make either an escape or an avoidance response to grid shock which was presented every 20 sec. Escape-avoidance sessions lasted 6 hr. and alternated with a 6-hr rest period for 21 days. Response rate, body weight, food and water intake, and diurnal consummatory pattern were recorded daily. Adrenal weight and ulcer incidence were noted at the termination of each experiment. Experimental Ss did not differ significantly from yoked controls on the dependent variables recorded. Only a small percentage (7.2%) of experimental "executive" Ss developed ulcers. (25 ref.)—*Journal abstract.*

625. Spear, Norman E., Klein, Stephen B., & Riley, Edward P. (Rutgers State U.) **The Kamin effect as "state-dependent learning": Memory-retrieval failure in the rat.** *Journal of Comparative & Physiological Psychology*, 1971(Mar), Vol. 74(3), 416-425.—Observed state-dependent learning in 185 naive albino Sprague-Dawley rats when learning followed stress by the intermediate-length interval presumed to involve greatest stimulus change, but only if the source of the stress was avoidance learning and not if it was inescapable shocks. Results support a memory-retrieval interpretation of the Kamin effect. (37 ref.)—*Journal abstract.*

626. Weiss, Jay M. (Rockefeller U., New York, N.Y.) **Somatic effects of predictable and unpredictable**

shock. *Psychosomatic Medicine*, 1970(Jul), Vol. 32(4), 397-408.—12 male albino Sprague-Dawley rats were used in 4 experiments to examine the effects of stressor predictability on a variety of stress responses, such as stomach ulceration, plasma corticosterone concentration, and body weight changes. Ss that received electric shocks unpredictably showed greater somatic stress reactions and more stress-induced pathology than Ss that received the same shocks but could predict their occurrence by a signal. Ss in the unpredictable and predictable shock conditions received shock simultaneously through fixed body electrodes wired in series, so that shock was always of exactly the same intensity and duration for the 2 groups.—*W. G. Shipman.*

627. Yakovlev, N. N. (Leningrad Research Inst. of Physical Culture, USSR) *Fiziologicheskie aspekty vyносливности pri myshechnoi deyatel'nosti.* [Physiological aspects of endurance in muscular activity.] *Fiziologicheskii Zhurnal SSSR*, 1970(Sep), Vol. 56(9), 1263-1275.—Based on the analysis of data of biochemical, cytological, physiological, and pharmacological research, (a) the physiology and biochemistry of endurance in muscular activity (MA), and (b) the specific forms which it takes are discussed. The development of endurance is viewed as an adaptational process, dependent on biochemical and functional changes which occur in the organism during MA. Data are presented on (a) the phases of adaptational development in MA, and (b) the influence of biologically active agents on this process. Along with the states of quiet and activity, a 3rd state—rest—is distinguished. (English summary) (63 ref.)—*I. D. London.*

GENETICS

628. Duncan, Nancy C., Grossen, Neal E., & Hunt, Earl B. (U. Washington) **Apparent memory differences in inbred mice produced by differential reaction to stress.** *Journal of Comparative & Physiological Psychology*, 1971(Mar), Vol. 74(3), 383-389.—Tested 51 DBA/2J and 53 C3H/HeJ inbred male mice on a variety of aversively motivated tasks, including passive avoidance, shuttle box, 1-way active avoidance, and a T maze. Open-field activity was also investigated. Between-strain differences were found to exist in the majority of the tasks, and were shown to be the result of different strain-specific responses to stress and stimulus conditions. The observed behavioral differences could not be adequately accounted for by a hypothesis of different memory capabilities in each strain.—*Journal abstract.*

629. Nachman, Marvin; Larue, Christiane, & Le Magnen, Jacques. (U. California, Riverside) **The role of olfactory and orosensory factors in the alcohol preference of inbred strains of mice.** *Physiology & Behavior*, 1971(Jan), Vol. 6(1), 53-59.—Describes 3 experiments with 134 male & BALB/c and C57BL mice. Removal of the olfactory bulbs in 15 Ss of each strain eliminated the aversion to alcohol which is seen in normal BALB/c mice but did not abolish the preference for alcohol seen in normal C57BL mice. This result, along with the fact that BALB/c mice appear to avoid alcohol immediately, without prior experience, led to the hypothesis that BALB/c mice are more responsive than are C57BL mice to alcohol as a sensory stimulus. To test this hypothesis, a conditioning procedure was used in which 20 normal Ss of each strain drank alcohol in a

single bottle test and were then injected with toxic lithium chloride. It was found that BALB/c Ss learned aversions to alcohol, saccharin, and sucrose, whereas C57BL Ss learned aversions to saccharin and sucrose but were deficient in learning an alcohol aversion. It was concluded that BALB/c mice normally avoid alcohol because of its odor but that for C57BL mice, other sensory cues or postingestional factors play an important role in their preference for alcohol. (19 ref.)—*Journal abstract.*

630. Oliverio, Alberto. (Lab. of Psychobiology & Psychopharmacology, Rome, Italy) **Genetic variations and heritability in a measure of avoidance learning in mice.** *Journal of Comparative & Physiological Psychology*, 1971(Mar), Vol. 74(3), 390-397.—Studied individual variability and heritability in 360 CD1 random-bred mice and 360 SEC/1ReJ inbred mice in a measure of avoidance learning (shuttle box). Analysis of variance indicated that a random-bred population of mice is characterized by extremely variable-learning performances while intrasire mating or inbreeding results in a clear reduction of the individual differences. 2 different estimates of heritability were obtained by using full-sib and $\frac{1}{2}$ -sib correlations, and intrasire regressions of offspring on dams. Both estimates of heritability showed that nearly 50% of the variance among intrasire offspring was attributable to additively genetic causes. (27 ref.)—*Journal abstract.*

631. Thiessen, Delbert D. (U. Texas) **The genetic determination of behavior.** *Science Teacher*, 1970(Apr), Vol. 37(4), 53-54.—Discusses physiological pathways and environmental adaptations of a genetically determined response termed negative geotaxis in A/J and C57BL/6J strains of mice. Monotonic relations between angle of incline and response orientation attributed to genotype in each strain are compared. A description and diagram of the tilting incline plane apparatus is presented.—*P. Zell.*

PERSONALITY CORRELATES

632. Edelman, Robert I. (Florida Technological U., Orlando) **Desensitization and physiological arousal.** *Journal of Personality & Social Psychology*, 1971(Mar), Vol. 17(3), 259-266.—Obtained fear hierarchies from 40 male undergraduates selected for 1 or more standard deviations on the MA scale. Fear scenes were determined representing either 100 (high fear) or 25 (low fear) on the subjective anxiety scale. Ss then received 3 training sessions in progressive relaxation or a control relaxation procedure. Both techniques resulted in decreased autonomic, EMG, and behavioral tension, with no differences due to type of training. After termination of the relaxation training, the fear scene determined in the initial session was read to each S, and he was asked to imagine himself in that situation across 5 vicarious presentations of the scene. The major finding was habituation in skin conductance as a function of successive presentations. Central vs. peripheral control of anxiety is discussed. (22 ref.)—*Journal abstract.*

633. Forrest, Marvin & Kroth, Jerome A. (U. Southern California, Medical Center) **Psychometric and physiological indices of anxiety.** *Journal of Clinical Psychology*, 1971(Jan), Vol. 27(1), 40-42.—Groups of 105 Ss each, selected on the basis of high, medium, and low scores on psychometric indices of anxiety, were subjected to a continuous matching task

upon which was superimposed a shock avoidance contingency. Ss with high state anxiety scores exhibited higher systolic blood pressure readings than did the other 2 groups and the findings were consistent with the state-trait theory of anxiety and the emotional reactivity hypothesis. A significant relationship was found between the Trait Anxiety Index and diastolic blood pressure and between the MA scale and diastolic blood pressure.—E. J. Kronenberger.

634. Fredericks, Richard S. (Illinois Inst. of Technology) **Repression-sensitization and pupillary response to pleasant and unpleasant stimuli.** *Dissertation Abstracts International*, 1970(Nov), Vol. 31(5-B), 2982.

635. Gellhorn, E. (2 Fellowship Circle, Santa Barbara, Calif.) **The emotions and the ergotropic and trophotropic systems: I. The physiological control of the emotions.** *Psychologische Forschung*, 1970, Vol. 34(1), 48–66.—Describes the characteristics of the ergotropic and trophotropic systems on the basis of stimulation and lesion experiments. The integration of autonomic and somatic processes is stressed. Muscle tone, hypothalamic and emotional excitability are positively correlated. Willed changes in muscle tone may therefore be used to control emotions. The trophotropic rebound following strong ergotropic excitation represents a physiological mechanism for effectively terminating emotional excitement. It is difficult, however, to utilize this mechanism in social situations arousing emotions.—*Journal summary*.

637. Lambert, W. W., Frankenhaeuser, M., Johansson, G., & Klackenborg-Larsson, I. (U. Stockholm, Sweden) **Catecholamine excretion in young boys and their parents as related to behavior.** *Philippine Journal of Psychology*, 1969(Dec), Vol. 2(2), 35–42.—Examined catecholamine excretion during night rests in 50 boys, aged 8–9 yr., and their parents. The families were sampled from a longitudinal study on growth and mental development, and the catecholamine measures were related to various measures of behavior that had been gathered during the boys' lives as well as to data on the disciplinary procedures employed by the parents. It was shown that: (a) the Ss' noradrenaline excretion rate was positively correlated with that of their mothers, (b) the Ss' adrenaline excretion was positively related to their intellectual level and to some indicators of emotionality, and (c) the fathers' noradrenaline excretion rate was negatively correlated with the frequency at which they "smacked" their children as well as with their social status. Other possible relationships between catecholamine excretion levels of sons, mothers, and fathers and disciplinary procedures are discussed. (24 ref.)—*Journal abstract*.

638. Mead, Philip G. (Tufts U.) **The effect of orientation passages on patient stress prior to dentistry.** *Psychological Record*, 1970(Fal), Vol. 20(4), 479–488.—18 clinic patients underwent 2 dental operations, 1 normal and 1 preceded by orientation passages which emphasized either the disturbing or beneficial aspects of the procedure. Physiological and subjective measures of stress were recorded, and all Ss completed the Denial (Dn) scale of the MMPI. Results demonstrate

that (a) Ss showed marked elevations in stress prior to treatment when read a passage concerning disturbing aspects of dentistry, but indicated significantly less stress following a passage that pointed out the beneficial aspects, and (b) Ss who scored high on the Dn scale of the MMPI indicated less overall stress while anticipating treatment than those scoring low. Findings are discussed in relationship to studies of vicarious stress and to stress research as a whole. (16 ref.)—*Journal abstract*.

639. Paige, Karen E. (U. Michigan) **The effects of oral contraceptives on affective fluctuations associated with the menstrual cycle.** *Dissertation Abstracts International*, 1970(Nov), Vol. 31(5-B), 2963.

640. Passingham, R. E. (Inst. of Psychiatry, London, England) **The neurological basis of introversion-extraversion: Gray's theory.** *Behaviour Research & Therapy*, 1970(Nov), Vol. 8(4), 353–366.—Reviews evidence relevant to the theory put forward by Gray of the neurological basis of introversion-extraversion. It is argued that a crucial prediction from the theory is that prefrontal cortical lesions should produce an increase in extroverted behavior. The literature is reviewed on the effects of such lesions in temperamental traits related to this personality dimension in both man and nonhuman primates. It is argued that it would be premature to conclude that the prediction is, as yet, adequately tested or verified.—A. Barclay.

NUTRITION & GASTROINTESTINAL PROCESSES

641. Liggio, Fernando. (U. Palermo, Clinic for Disorders of the Nervous System, Italy) **Interferenza nella realizzazione delle attività mentali secondaria ad errata alimentazione carente dell'apporto proteico di origine animale e turbe nervose oligosintomatiche complementari reversibili.** [Interference in the performance of the mental activities due to the wrong diet which lacks the protein factor of animal origin and nervous disorders which are complementary and reversible.] *Acta Neurologica*, 1969(Jul), Vol. 24(4), 548–556.—Observed for 1 yr. minors with IQs from 70–90. Ss were sent by their teachers for neuro-psychiatric help because of their notable distractibility in school. The most disturbed Ss had no animal protein in their diets, not even in the form of dairy products. Their diet consisted of bread, potatoes, and pasta. As a result, they were restless, often demonstrating an impulsive tendency to touch everything; their attention span was very low, and they demonstrated an inefficiency in memory test. A modest perimaleolar edema was present. In those Ss whose family followed the dietary advice of 100 gm. of meat daily (in poor families horse meat was used), motor disorders, attention span, and memory improved considerably. (English summary) (45 ref.)—A. M. Farfaglia.

642. Schapiro, H., Wruble, L. D., Britt, L. G., & Bell, T. A. (U. Tennessee, Medical Units, Memphis) **Sensory deprivation on visceral activity: I. The effect of visual deprivation on canine gastric secretion.** *Psychosomatic Medicine*, 1970(Jul), Vol. 32(4), 379–396.—"In 13 dogs with gastric cannulas, a range for gastric acid output and pepsin concentration was established. The vision of each dog was then compromised. A marked inhibition of the gastric secretory output occurred in all dogs over a 4-mo period." (56 ref.)—W. G. Shipman.

on VR, FR, and FFI food-reinforcement schedules. *Dissertation Abstracts International*, 1970(Nov), Vol. 31(5-B), 3034-3035.

ANIMAL PSYCHOLOGY

644. Bertrand, Mireille. The behavioral repertoire of the stump-tail macaque: A descriptive and comparative study. Basel, Switzerland: S. Karger, 1969. xi, 233 p.

645. Firsov, L. A. (Pavlov Inst. of Physiology, Leningrad, USSR) Rol' faktora izbiratel'nosti v organizatsii sledovykh protsessov (pamyati) u antropoidov. [Role of the selective factor in organization of trace processes (memory) in apes.] *Voprosy Antropologii*, 1969, No. 33, 159-167.—5-12 yr. old chimpanzees were used to study the "property of selectivity" (viewed as the external manifestation of definite organic states) in order to determine the length of time that visual traces, resulting from conditioned stimulation, are retained. To accomplish this delayed reactions involving choice were investigated as a function of "functional attunement ('set') to definite forms of reinforcement (variety of alimentary and play items). It is shown that there is a close tie between level of correct choice and the form of UC reinforcement. It is suggested that the signal significance of artificial and natural CSs is determined in each concrete instance through organized sets readying the animal for alimentary or play. A dynamic influence on the mechanisms of memory is exerted by the "systems of the 'alimentary center' and of orienting-investigatory activity" which elicit appropriate behavior when items are presented for choice. In the process of forming "trace behavior," this specialized character of "nervous set" makes it possible for the animal, on perception of the conditioned signal, to make the necessary correctives so as to bring behavior into correspondence with both the "history" of this signal and the current needs of the animal. (26 ref.)—J. D. London.

COMPARATIVE PSYCHOLOGY

646. Beach, Frank. (U. California, Berkeley) It's all in your mind. *Psychology Today*, 1969(Jul), Vol. 3(2), 33-35, 60.—While sex hormones are similar across species, sexual behavior differs so widely from species to species that something other than hormones is at work. Evidence suggests "that the cortex is essential for mating in males of lower species but dispensable for females." Differences in the sexual behaviors of men and women suggest that this relationship also may hold to a degree in humans, e.g., men are aroused by visual stimuli but women are not. There is also a trend for higher animals (those with a more fully developed neocortex) to be more selective in their choice of partners.—E. J. Pasavac.

647. Behrend, Erika R., Powers, Alice S., & Bitterman, M. E. (Bryn Mawr Coll.) Interference and forgetting in bird and fish. *Science*, 1970(Jan), Vol. 167(3917), 389-390.—Measured retention in 24 white Carneaux pigeons and in 24 goldfish 1 day or 2 wk. after the mastery of each of a series of color discriminations. The amount of forgetting in the pigeon increased with the number of prior problems and increased more rapidly at the longer than at the shorter interval. The amount of forgetting in the goldfish was independent, at both

intervals, of the number of prior problems. Results point to the operation of different memory mechanisms in the 2 animals.—*Journal abstract.*

648. Bermant, Gordon. (U. California, Davis) Never mind the birds and bees: Regard the praying mantis. *Psychology Today*, 1969(Jan), Vol. 3(2), 28-32.—Considered the varieties of sexual behavior exhibited by various species of insects, fish, and mammals. It is concluded that: (a) "there is no biological necessity that every animal have 2 parents," (b) there are apparently biological advantages if 2 organisms contribute to the genetic make-up of the new individual, and (c) biological necessities often can account for unique social behavioral patterns. The division of humans into males and females should not, therefore, be taken for granted. On the contrary, the biological meaning of this division and the social milieu in which interaction occurs must be understood.—E. J. Pasavac.

649. Heninger, Owen P. (Utah State Hosp., Provo) Features of "motivation." *Provo Papers*, 1968(Win), No. 4, 1-11.—Discusses 2 aspects of motivation: (a) the stimulation of an individual to make a desired response, and (b) the kinds of patterns already accumulated within an individual which motivate him to act in certain ways. Similarities between the actions and motivations of man and animals are noted and illustrated.

NATURAL OBSERVATION

650. Conrad, Kelley A. & Fidura, Frederick G. (State University Coll. New York, Geneseo) An ethological study of diurnal behavior in woodchucks (*Marmota monax monax*) during the vernal period. *Psychological Record*, 1970(Fal), Vol. 20(4), 509-512.—Studied the diurnal behavior of woodchucks in a selected area within a niche of habitat between April 8 and May 17. Activity in each of 5 behavior categories was found to differ significantly from values predicted from earlier studies. Vernal behavior was predominantly foraging in nature. Daily patterns of activity which changed with the seasonal warming were interpreted as supporting earlier observations that woodchuck activity was tied to temperature changes. Early in the vernal period, activity was characteristically unimodal with a peak at midday. Later, as temperatures were warmer and hours of daylight longer, activity was bimodal, peaking early in the morning and late in the afternoon.—*Journal abstract.*

EARLY EXPERIENCE

651. Bradley, Elspeth A. (Queen's U., Belfast, Ireland) Some effects of rearing young mice in the presence of adult male and female mice of the same strain. *Papers in Psychology*, 1969(Oct), Vol. 3(2), 61-62.—Studied the effects of the odor of male and female mice on (a) the growth, development, and adult behavior of young mice, and (b) on maternal behavior. 18 pregnant mice were exposed to the odor of a male mouse, a female mouse, or no other mice. No significant differences were found between the mice from all litters. There was a tendency, however, for male mice exposed to male odor to gain weight more rapidly and to groom more in the open field. Female mice exposed to male odor tended to mature earlier sexually. Female odors tended to be more disturbing to the mothers. Possible reasons for differences between this study and previous studies are discussed.—S. Knapp.

652. Prescott, James W. (National Inst. of Health, Bethesda, Md.) **Sensory deprivation vs. sensory stimulation during early development: A comment on Berkowitz's study.** *Journal of Psychology*, 1971(Mar), Vol. 77(2), 189-191.—Contrasts 2 theoretical formulations that are derived from sensory deprivation and sensory stimulation studies during early development to account for the results obtained by E. L. Berkowitz. Evidence is cited that a sensory deprivation model had greater predictive validity of later behavior than a sensory stimulation model in accounting for the findings of Berkowitz. Theoretical formulations based upon Cannon's Law of Denervation Supersensitivity was considered more heuristic than an optimal-arousal theory. (18 ref.)—*Author abstract*.

INSTINCTS

653. Christopher, Steven B. (Pennsylvania State U.) **Effects of age and social experience in imprinting in domestic turkeys and chickens.** *Dissertation Abstracts International*, 1970(Oct), Vol. 31(4-B), 2362-2363.

654. Fongemie, Victor X. (U. Maine) **Stimulus intensity and imprinting behavior: A test of the Schneirla-Moltz hypothesis.** *Dissertation Abstracts International*, 1970(Oct), Vol. 31(4-B), 2304.

655. Slater, P. J. (U. Edinburgh, Scotland) **Nest building in the Bengalese finch: I. External factors affecting it and its relation to other behaviour early in the breeding cycle.** *Behaviour*, 1970, Vol. 36(4), 300-319.—Studied the nesting behavior of the male and female Bengalese finch during various stages of the nesting cycle. Incubation duration, carry of nest material, and visits to the nest box were among the dependent variables recorded. The major findings were that males tend to carry nest materials more than females though the female spent more time building within the nest box. While some form of visual contact with a conspecific appeared necessary to stimulate nesting in most males, about 25% were able to build in isolation. The commencement of egg-laying was associated with a decline in male carrying, though carrying persisted throughout incubation if completed nests were removed during the day. By providing "foster eggs" incubation could also be induced in both males and females before the pair produced their own eggs. While reproductive behavior appears to be under the ultimate control of external events it is possible that "external stimuli rely more on hormonally induced permissive states to exert their influence on behavior early in the cycle than they do later on." (German summary)—*S. R. Goldstein*.

MOTIVATION & EMOTION

656. Bauer, Ellen R. (Coll. of William & Mary) **Schedule and quinine induced deprivation in feeding and refeeding.** *Physiology & Behavior*, 1971(Jan), Vol. 6(1), 87-90.—Adapted 20 female albino DUB/SDD rats to either 0 or 23 hr. of food deprivation. 1/2 of each group was then fed .125% quinine sulfate adulterated diet for 7 days. Following the quinine feeding, ad lib feeding (refeeding) was instituted for 14 days. Results indicate that: (a) Ss on a deprivation schedule failed to show a predicted change to regulation on the basis of taste rather than calories; (b) Ss on food deprivation actually increased their relative intake of water; and (c) refeeding after a deprivation schedule did not lead to depression of

initial intake below normal, but otherwise the process of recovery, followed the same course as after total starvation.—*Journal abstract*.

657. Bauer, F. Samuel. (Coll. of William & Mary) **Glucose preference in the guinea pig.** *Physiology & Behavior*, 1971(Jan), Vol. 6(1), 75-76.—Determined the glucose preference profile for 9 guinea pigs (*Cavia porcellus*) of the English variety, by both single and 2 stimulus methods. A concentration of .2 molar was shown to be most highly preferred by both methods. These behavioral results agree with previous electrophysiological measures.—*Journal abstract*.

658. Bertsch, Gregory J. & Leitenberg, Harold. (U. Vermont) **A "frustration effect" following electric shock.** *Learning & Motivation*, 1970(May), Vol. 1(2), 150-156.—Compared the effects of nonreward, punishment by mild electric shock, and their combination in an Amsel double-alleyway situation. 32 male albino rats ran faster following either nonreward, punishment with shock, or both combined than they did following reward alone. There were no differences in the magnitude of these effects. Results extend the empirical evidence for the assertion that mild aversive stimuli, e.g., electric shock and nonreward, often yield equivalent behavioral effects. They also suggest that increased vigor in the performance of behavior following nonreward, heretofore termed a "frustration effect," might be best considered a subset of a more general phenomenon: either escape behavior superimposed upon food motivated behavior, or an "excitatory effect" resulting from mild aversive stimulation. (15 ref.)—*Journal abstract*.

659. Boice, Robert & Witter, Janet A. (U. Missouri) **Motivating prairie dogs.** *Psychonomic Science*, 1970(Sep), Vol. 20(5), 287-289.—Appetitive responding (double alternation and DRL) in 4 tamed prairie dogs (*Cynomys ludovicianus*) was effected with food and water reinforcement. The result was generally inconsistent performance and/or death by starvation or dehydration. While wild prairie dogs did not need drinking water, tamed captives became vitally dependent. This need was met by operant responding only when terms of work were easy; when the terms of work were moderately difficult, some Ss stopped responding and died of dehydration.—*Journal abstract*.

660. Bolles, Robert C. (U. Washington) **The cue value of illumination change in anticipatory general activity.** *Learning & Motivation*, 1970(May), Vol. 1(2), 177-185.—Discusses (a) how the cue value of an environmental stimulus change varies with its proximity to feeding, and (b) how an environmental cue, e.g., a change in illumination, compares in importance with other, presumably internal cues to the time of feeding. 36 male Wistar rats in activity wheels were fed regularly once a day. All Ss were maintained under 12-hr light, and 12-hr dark environmental conditions, but different groups were fed 20, 60, or 180 min. after a change from light to dark or from dark to light. Results indicate that prevailing illumination conditions had a marked effect upon activity level, but that there was no cue effect of changing illumination. Most Ss demonstrated an anticipation of feeding which was quite independent of the environmental cue.—*Journal abstract*.

661. Budgell, Philip. (Inst. of Experimental Psychology, Oxford, England) **The effect of changes in ambient temperature on water intake and evaporative water loss.** *Psychonomic Science*, 1970(Sep), Vol. 20(5), 275-276.—Revealed in 2 experiments, with 6

female albino rats in each, that Ss deprived of water at the same temperature and tested at different temperatures drink different amounts. The conclusion that ambient temperature has a direct effect on drinking is supported by the finding that evaporative water loss at the different temperatures could not account for the differential water intake.—*Journal abstract.*

662. Capretta, Patrick J. (Miami U.) **Saccharin and saccharin-glucose ingestion in two inbred strains of *Mus musculus*.** *Psychonomic Science*, 1970(Nov), Vol. 21(3), 133-135.—In Exp. I, 10 C57BL/6J and 10 DBA/2 J mice received saccharin in daily 1-hr sessions for 19 days while hungry or satiated. Exp. II involved giving the same Ss saccharin or glucose and saccharin plus glucose for 24-hr periods with or without solid food. It was found in Exp. I that saccharin consumption is related to drive; hungry Ss at 1st drank more than nonhungry Ss until the 11th day, after which the former group dropped off and was equaled by the latter. The effect was more pronounced for C57 than for DBA Ss—apparently related to strain differences in natural preferences for saccharin. Both strains drank large amounts of saccharin plus glucose in Exp. II especially when hungry. Results are discussed within the context of research on food habits.—*Journal abstract.*

663. Church, Russell M., Wooten, Carol L., & Matthews, T. James. (Brown U.) **Discriminative punishment and the conditioned emotional response.** *Learning & Motivation*, 1970(Feb), Vol. 1(1), 1-17.—Designed 3 experiments with 108 naive albino Norway rats to evaluate the effect of the addition of a response contingency to signal contingency, i.e., to compare discriminative punishment with the CER procedure. Exp. I showed discriminative punishment of a particular response is more effective than the CER procedure for suppression of that response. In tests with a response-shift procedure (Exp. II) and a concurrent-schedule procedure (Exp. III), however, the magnitude of suppression of an unpunished response of Ss in a discriminative punishment procedure was indistinguishable from that of CER Ss. Thus, the suppression produced by the CER treatment is related to the signal but independent of any particular response, while the suppression produced by discriminative punishment is related both to the signal and to the specific response.—*Journal abstract.*

664. Colotta, V. A., Keehn, J. D., & Gardner, Leslie L. (York U., Toronto, Ontario, Canada) **Control of schedule-induced drink durations by interpellet intervals.** *Psychonomic Science*, 1970(Nov), Vol. 21(3), 137-139.—Reinforced 2 food-deprived naive male albino rats with 45-mg Noyes pellets after simple fixed intervals of 15, 30, 60, and 120 sec. and after alternating 15- and 120-sec intervals. "Postpellet" drink duration varied directly with interpellet intervals in the simple fixed-interval case. In the alternating-interval case, postpellet drink durations (or tube contacts) were greater in 120-sec than in 15-sec intervals. Schedule-induced drink durations appear to be controlled by the probability of availability of food.—*Journal abstract.*

665. Cox, Verne C. (Fels Research Inst., Yellow Springs, O.) **Consumption of a combined glucose-NaCl solution during normal and food deprivation conditions.** *Psychonomic Science*, 1970(Sep), Vol. 20(5), 300-301.—A solution containing glucose and sodium chloride proved highly palatable to 10 female Holtzman albino rats and in the majority of cases was preferred

during food deprivation over a calorically equivalent solution containing saccharin and glucose.—*Journal abstract.*

666. Di Lollo, Vincent & Meyer, Peter N. (U. Western Australia, Nedlands) **Pattern of daily water consumption in relation to intake of saccharin solution.** *Psychonomic Science*, 1970(Sep), Vol. 20(5), 265-266.—Presented 12 nondeprived rats with a bottle (B2) containing .25% saccharin solution for 1 hr/day in addition to the maintenance water bottle (B1). After 14 days (preshift), the contents of B2 were changed to plain tap water for 6 days (postshift). Intake from B1 in the 1 hr. preceding the time of B2 presentation increased during preshift while overnight intake decreased, suggesting the emergence of a B1 drinking schedule as intake from B2 increased. However, detailed aspects of the results were not consonant with this possibility. During postshift, intake from B1 returned to the initial preshift level while intake from B2 rose to a much higher level, suggesting the operation of secondary reinforcement.—*Journal abstract.*

667. Fantino, Edmund; Kason, David, & Stringer, Neil. (U. California, San Diego) **The Yerkes-Dodson law and alimentary motivation.** *Canadian Journal of Psychology*, 1970(Apr), Vol. 24(2), 111-124.—Studied 45 male naive white Carneaux pigeons in a detour problem. S was facing food reward but was behind a wire screen. A 3 × 3 design was employed in which degree of hunger and problem difficulty were varied. Increased deprivation improved problem-solving monotonically and for each level of problem difficulty studied. No evidence was found for the Yerkes-Dodson law, which states that the optimal level of motivation should vary with problem difficulty. The Yerkes-Dodson law has been confirmed often with aversive motivation; the present experiment was the 1st attempt to test this law by varying task difficulty in a problem involving alimentary motivation. 668. Frazier, James R. (U. North Carolina, Child Development Inst., Chapel Hill) **Rat activity as a function of water deprivation and age.** *Psychonomic Science*, 1970(Sep), Vol. 20(5), 299.—4 rats were water deprived for 24, 48, 72, 96, and 120 hr., beginning at ages 37, 59, and 81 days. Naive (37 days) Ss increased activity over base line after 24 hr.; deprivation-experienced Ss showed activity decrements after 24 hr. All Ss sharply decreased activity at 120 hr. at each age interval.—*Journal abstract.*

669. Ginsburg, Harvey J. & Braud, William G. (U. Houston) **Changes in preference for cage environments following habituation and shock in the Mongolian gerbil.** *Psychonomic Science*, 1970(Nov), Vol. 21(3), 183-184.—Tested daily 12 Mongolian gerbils on their preference for their own familiar vs. other novel litter environments. Ss showed a striking preference for the home environment which gradually declined over 6 days of testing. The home litter preference was reinstated following aversive stimulation. Data are discussed in terms of habituation, dishabituation, and fear. Some incidental observations on depth perception in this species are also reported.—*Journal abstract.*

670. Loop, Michael S. (Florida State U.) **The effects of feeding experience on the response to prey-object extracts in rat snakes.** *Psychonomic Science*, 1970(Nov), Vol. 21(3), 189-190.—Measured the responses of 8 young rat snakes (*Elaphe*) to different prey-object extracts after 8 mo of eating mice. Mean

attack/tongue-flick scores at birth revealed no reliable difference in the stimulating value of the prey-object extracts. Mean attack-orientation scores after the mice feedings revealed a clear preference for mice. The scores for other stimuli dropped, while that for mice remained almost identical for initial and postfeeding tests. It is suggested that the initial scores revealed an undifferentiated attack tendency. It is concluded that the "preference for what is available coupled with a retained preference, as compared to water, for what might be more available in the future has clear survival value."

671. Marwine, Alan G. & Collier, George. (Rutgers State U.) **Instrumental and consummatory behavior as a function of rate of weight loss and weight maintenance schedule.** *Journal of Comparative & Physiological Psychology*, 1971(Mar), Vol. 74(3), 441-447.—Examined the functions relating instrumental behavior to percentage body weight loss (%BWL) in 4 groups of 7 male albino Sprague-Dawley rats which lost weight at different rates. Log bar-press rate was a linear function of log %BWL. Rate of BWL had no effect on either the form of the function or the level of behavior. Bar-press rate decreased in Ss maintained at a constant percentage of their expected weights but increased when Ss were held at a constant weight. Results are interpreted as showing that the BWL = behavior function was path-independent, and that BWL should be measured from the value at initial deprivation. The rate increase in constant weight Ss was due to physiological adaptation to water restriction.—*Journal abstract.*

672. Myer, James S. & Kowell, Arthur P. (Johns Hopkins U.) **Eating patterns and body weight change of snakes when eating and when food deprived.** *Physiology & Behavior*, 1971(Jan), Vol. 6(1), 71-74.—Maintained 4 Florida king snakes in a warm (27° C) room with continuous access to water and presented mice to them daily for 17 wk., after which they were not fed for 6 wk. When fed daily, Ss ate large meals at intervals of 4-5 days and increased their body weights an average of 61% during the 17-wk period. During the 1st few days of food deprivation they lost a substantial amount of weight as they digested the last meal, but their weights fell very slowly thereafter. After 6 wk. of food deprivation the average body weight loss relative to weight immediately before the last predeprivation meal was only 6.3%. When feeding was resumed after deprivation, none of the Ss displayed an increase in food intake, and 2 failed to eat for extended periods.—*Journal abstract.*

673. Nash, Richard F., Gallup, Gordon G., & McClure, Michael K. (Tulane U.) **The immobility reaction in leopard frogs (*Rana pipiens*) as a function of noise-induced fear.** *Psychonomic Science*, 1970(Nov), Vol. 21(3), 155-156.—Hypothesized that a loud pre-induction noise should prolong the duration of the immobility reaction by increasing the level of fear or arousal prior to manual restraint. 34 frogs served as Ss, with 1/2 receiving a loud noise just prior to being immobilized, while the remainder served as a control group. Ss exposed to preinduction noise remained immobile significantly longer than controls. Results are discussed as providing additional support for the idea that the immobility response represents an innate fear reaction.—*Journal abstract.*

676. Van Hemel, Paul E. & Myer, James S. (U. Maine, Portland) **Satiation of mouse killing by rats in an operant situation.** *Psychonomic Science*, 1970(Nov), Vol. 21(3), 129-130.—Allowed 20 adult male Long-Evans mouse-killing rats to pace their killing behavior by use of an operant response reinforced with mouse presentation. When tested after intervals of 1, 2, and 4 days without exposure to mice, Ss averaged more than 30 responses and kills before reaching a satiation criterion of 15 min. without a response. In a 10-hr session, during which responding was continuously reinforced, 4 Ss killed 32-57 mice early in the session, then emitted occasional bursts of response during the remainder of the session, obtaining and killing an average of 41 additional mice. Findings contradict a previous report that mouse killing by rats is easily satiated.—*Journal abstract.*

677. Wilson, Arthur S. & Barboriak, Joseph J. (Veterans Administration Center, Wood, Wis.) **Lick volume determined by food schedules in rats.** *Psychonomic Science*, 1970(Sep), Vol. 20(5), 271-272.—The number of licks and fluid consumed were recorded separately for 10 male Sprague-Dawley rats during a 7-day adjustment period followed by a 33-day period during which the Ss were fed for only 2 hr. each day. Significant differences in the number of licks/ml of water consumed between food and no-food periods appeared after the 1st experimental wk. There was a significant decrease in lick rate from the 1st-2nd hr. of each feeding period and also from the feeding to the nonfeeding period. Use of a lick count to determine volumes of fluids ingested on different feeding schedules could be misleading.—*Journal abstract.*

Interaction between appetitive Pavlovian CSs and instrumental avoidance responding. *Learning & Motivation*, 1970(Jan), Vol. 1(1), 18-26.—Trained 3 groups of 5 mongrel dogs 1st to avoid shock by responding to a visual signal. 2nd, these groups underwent appetitive Pavlovian conditioning operations in a different environment. Later when compounded with cue for avoidance in transfer tests, a CS+ which reliably signaled food presentations during Pavlovian

motivation, rather than a limitation of the amount of food that can be consumed.—*Journal abstract.*

Discrimination

700. Farthing, G. William & Hearst, Eliot. (U. Maine) **Attention in the pigeon: Testing with compounds or elements.** *Learning & Motivation*, 1970(Feb), Vol. 1(1), 65-78.—Experimentally naive female pigeons served as Ss in 2 experiments (Ns = 12 and 18). Ss received free-operant go/no-go discrimination training in which the positive stimulus for all Ss was a visual compound, a vertical white line on a blue background. After discrimination training, 2 types of test trials ("elements": blue, green, vertical, horizontal; "compounds": blue-vertical, blue-horizontal, green-vertical, green-horizontal) were presented to each S during extinction. Under most conditions both kinds of trials revealed that responding was more strongly controlled by wavelength than by line-tilt. However, only compound trials proved sensitive enough to consistently reveal differential control within the weaker (line-tilt) dimension; the near-0 response output to vertical or horizontal lines presented alone on the "elements" trials made it very difficult to detect any differential line-tilt control and could have led to the erroneous conclusion that some Ss had not attended at all to the line-tilt dimension. Other comparisons from the present experiments provide information on "blocking" effects and on the influence of different negative stimuli in the development of stimulus control along the wavelength and line-tilt dimensions. (19 ref.)—*Journal abstract.*

(Hofstra U.) **The role of motivational and incentive levels in the determination of successive discrimination reversal (SDR) performance of Chukar partridge.** *Psychonomic Science*, 1970(Sep), Vol. 20(5), 291-292.—Studied the performances of 14 Chukar partridges on a spatial successive discrimination reversal task at 2 levels of drive (D) and at 2 levels of incentive (K). Variation in both D and K led to variation in errors across reversal problems. High D tends to increase errors, while high K yields a decrement in errors.—*Journal abstract.*

704. Hughes, R. N. & Swanberg, Karen M. (U. Canterbury, New Zealand) **Forcing, stimulus-change and alternation.** *Perceptual & Motor Skills*, 1970(Dec), Vol. 31(3), 902.—Observed that 12 male hooded rats approached and entered the previously blocked arm of a

grey T maze more often following forcing to the opposite arm by a black or white barrier than by a grey barrier. Intertrial removal of the former barrier constituted a greater stimulus change than removal of the latter. Ss responded more often to the previously blocked arm following this greater stimulus change.—*Author abstract.*

705. Krames, Lester. (U. Toronto, Erindale Coll., Ontario, Canada) **Responses of female rats to the individual body odors of male rats.** *Psychonomic Science*, 1970(Sep), Vol. 20(5), 274-275.—16 receptive Long-Evans female rats were 1st observed during a 10-min habituation period that consisted of presenting them with 2 empty cardboard tubes housing the odors from the same male. After the habituation period, 1 tube was removed and replaced with a tube housing the odors from a novel male. During the 2nd 10-min testing period, the females spent a significantly greater amount of time with the novel males' odor, after both 5 min. ($p < .02$), and 10 min. ($p < .01$) of testing. The females' response to the novel males' odor indicates that female rats can use olfactory cues to discriminate between individual male rats.—*Journal abstract.*

706. Lynch, Kathleen A. & Sheridan, Charles L. (U. Missouri, Kansas City) **Interocular transfer of a brightness and of a pattern discrimination in albino and pigmented guinea pigs.** *Psychonomic Science*, 1970(Sep), Vol. 20(5), 277-279.—Measured interocular transfer of a brightness and of a pattern discrimination in 20 albino and 20 pigmented guinea pigs. Substantial amounts of transfer occurred regardless of problem type or pigmentation, and neither problem type nor pigmentation had a reliable influence on interocular transfer. Transfer, though considerable, was incomplete (19 ref.)—*Journal abstract.*

707. Richman, Charles L., Gardner, John T., Montgomery, Mark D., & Benewicz, Karol L. (Wake Forest U.) **Effects of body weight loss on position and brightness discrimination tasks.** *Learning & Motivation*, 1970(May), Vol. 1(2), 218-225.—36 male, albino rats were given discrimination training in a T maze. The design consisted of a 3×2 factorial combining 3 levels of drive (95, 85, and 75% mean ad lib body weight loss) and 2 types of discrimination tasks (position and brightness). It was found that discrimination learning was facilitated by increased drive and that Ss reduced to 85 and 75% of their mean ad lib body weights learned the position problem in less days and with fewer errors to criterion than Ss trained on the brightness task. However, as a function of an initially strong tendency for Ss trained under low drive to demonstrate spontaneous alternation behavior, task differences, as measured by errors to criterion, were not found. (18 ref.)—*Journal abstract.*

708. Schrier, Allan M. (Brown U.) **Effect of location of the conditional cue on conditional discrimination learning by monkeys (Macaca mulatta).** *Learning & Motivation*, 1970(May), Vol. 1(2), 207-217.—In 2 experiments with 20 wild-born rhesus monkeys, Ss were trained on conditional discrimination problems consisting of a pair of objects differing in form, or, depending on the problem, in size. The conditional cue was the color of the test tray for $\frac{1}{2}$ the Ss and color of the pair of objects for the other $\frac{1}{2}$. The discriminative response was displacement of 1 of the objects. Original and reversal learning were generally better when the conditional cue was color of the objects. This agrees with the previous findings that monkeys are more likely to

attend to stimuli that they touch when responding than those they do not touch.—*Journal abstract.*

709. Somerville, John W. & Sharratt, Sara. (Southern Illinois U.) **Retinal size in the visual cliff situation.** *Perceptual & Motor Skills*, 1970(Dec), Vol. 31(3), 903-911.—Used 300 1-day-old Kimber Leghorn chicks in 2 experiments. Exp. I tested the hypothesis that unequal retinal size is an insufficient cue for depth discrimination in a visual cliff situation. 1 group of Ss was exposed to mirrors on deep and shallow sides which reflected only their image and a white ceiling. A 2nd group was exposed to white patterns, and a 3rd to stripe patterns equated for retinal size. No significant preferences were found. In Exp. II motion parallax was maximized by the use of 3-dimensional patterns. 1 group was exposed to 3-D patterns equated for retinal size, a 2nd to 2-D patterns unequated, and a 3rd to 3-D patterns unequated. A significant preference for the shallow side was found only for the 1st group. Results of both experiments suggest that the total size of the pattern areas was too small to permit consistent depth discrimination. Implications for studies attempting to define thresholds are discussed.—*Journal abstract.*

710. Sugimura, Takeshi. (Nara U. of Education, Japan) [Discrimination shift learning in animals.] *Japanese Psychological Review*, 1969(May), Vol. 12(1), 62-88.—Reviewed recent studies on the discrimination shift learning in animals under the headings: non-mediational and mediational theories, forced and extinction trials between discrimination and the shift, motivational factors, the role of irrelevant dimensions or stimuli, intradimensional and extradimensional shifts, and training procedures. It is concluded that: (a) effects of the reward magnitude are in line with the Theios' incentive model of discrimination reversal; (b) the presence of irrelevant dimensions is not necessarily related to obtaining the overtraining reversal effect; (c) as long as mediational theories distinguish clearly choice responses from mediating responses, the separate effects of the 2 responses must be specified for various types of shift; (d) in order to assess the relative strength of choice responses and mediating responses, the ease of various types of shift must be compared as a function of degree of original discrimination, and (e) developmental differences in reversal-nonreversal comparison are dependent upon types of shift and stimulus arrangements. (7 p. ref.)—*Journal abstract.*

711. Vom Saal, Walter & Jenkins, Herbert M. (Princeton U.) **Blocking the development of stimulus control.** *Learning & Motivation*, 1970(Feb), Vol. 1(1), 52-64. —2 experiments with 24 male White King pigeons in each, evaluated the possibility that prior discrimination training on red vs. green would block the development of stimulus control by tone vs. noise when both stimulus dimensions simultaneously predicted reinforcement. The key pecking response of pigeons was used in a discriminated trial procedure. In Phase 1 of Exp. I, Group D learned a go/no-go discrimination based on red vs. green, Group N was not run, Group R received reinforced trials only, and Group P received partial reinforcement. In Phase 2, all groups learned a go/no-go discrimination based on tone+red vs. noise+green. When tested after Phase 2, Group D showed less auditory control than any other group. The difference between Groups D and P was confirmed in Exp. II. Results show that blocking occurred, while ruling out a number of other factors that may have

caused apparent blocking in previous experiments. (15 ref.)—*Journal abstract.*

712. Weber, Roseann & Kamback, Marvin. (U. Pacific) **Two-cue discrimination learning by pigtail monkeys.** *Psychonomic Science*, 1970(Sep), Vol. 20(5), 269-270.—12 monkeys were given a discrimination between black vertical and white horizontal rectangles, and then given preference tests with original positive and negative stimuli paired with white vertical, black horizontal, white and black diagonal rectangles, and white and black circles. Ss responded more to circles than to other preference stimuli early in preference testing but less later, suggesting a novelty effect. Preference for the reinforced brightness was significantly higher than for the reinforced orientation.—*Journal abstract.*

714. Wickens, Delos D., Nield, Anthony F., Tuber, David S., & Wickens, Carol. (Ohio State U., Research Center, Experimental Psychological Lab.) **Classically conditioned compound-element discrimination as a function of length of training, amount of testing and CS-UCS interval.** *Learning & Motivation*, 1970(Feb), Vol. 1(1), 95-109.—Investigated in 3 experiments the development of a classically conditioned compound-element differentiation as reflected in the paw withdrawal response of the cat. Adult male and spayed female cats served as Ss. In Exp. I and II, the effects of length of training, the CS-UCS interval, and the presence or absence of test trials during acquisition were studied. Differentiation between compound (a light and a tone with simultaneous onset and termination) and its elements developed only if tests to the elements were given during the 12-wk acquisition period. There was some evidence that differentiation was better with 2000-msec interstimulus interval than with 1 of 500 msec. Exp. III investigated the effects of CS-UCS interval in a within-Ss design. The 8 different CS-UCS intervals used ranged from 150-3000 msec. In general, the longer the interstimulus interval, the better was the discrimination. At a given interval, extinction procedures clearly demonstrated better discrimination than the acquisition measures. Some theoretical implications of the results for compounding and for the effects of ITI are presented. A configural rather than a summation theory of compounding is favored.—*Journal abstract.*

Avoidance & Escape

715. Bintz, John; Braud, William G., & Brown, Judson S. (U. California, Davis) **An analysis of the role of fear in the Kamin effect.** *Learning & Motivation*, 1970(May), Vol. 1(2), 170-176.—Determined whether the retention of fear, indexed in a manner in which the effects of competing responses such as freezing are minimized, is a U shaped or an inverted U shaped function of time. In Exp. I, 36 male hooded Long-Evans rats were given 20 food-rewarded trials in a straight alley runway and then 2 trials in which Ss were given shock in the goalbox. The amount of approach was measured on the 21st trial which was conducted 5 min., 3 hr., or 48 hr. after the fear-conditioning trials. It was found that the amount of approach was greatest at the 3-hr interval. Exp. II, with 18 Ss, was identical except that no fear-conditioning trials were given. It was found that the amount of

approach was the same at all 3 intervals. (18 ref.)

716. Davenport, D. Gene. (St. Louis U.) **The secondary positive reinforcing properties of the cue in "automated" discriminated escape conditioning.** *Psychonomic Science*, 1970(Nov), Vol. 21(3), 149-151.
—Gave 2 albino rats extensive escape training where a leverpress on a variable ratio 5 schedule produced an auditory cue (S^D), in the presence of which a pigeon key response terminated a light and brief shock. Following leverpress extinction, Ss received either the S^D or a neutral auditory stimulus (S^N) on a variable interval 5 schedule, but no escapes. Each of the 4 tests involving S^D for each S showed greater response reacquisition than for S^N tests, demonstrating that the S^D functioned as a secondary positive reinforcer.—*Journal abstract.*

717. Davenport, D. Gene & Eschenbrenner, A. John. (St. Louis U.) **Double-intermittent reward scheduling and secondary-reinforcer strength: Discriminated escape.** *Psychonomic Science*, 1970(Nov), Vol. 21(3), 151-153.—Employed a discriminated escape procedure to train 2 groups of 18 naive male Sprague-Dawley rats to activate a nose press in the presence of a tone to escape a 1-ma shock. Escape was allowed on a continuous or an intermittent schedule. Each group was then divided into 3 subgroups, 2 of which were required to learn a leverpress response where the only reward was the tone, presented on a continuous or an intermittent reinforcement schedule. The 3rd subgroup served as a no-tone control. A durable secondary reinforcer was established which was a function of the secondary reinforcement schedule during testing.—*Journal abstract.*

718. Delprato, Dennis J. & Denny, M. Ray. (Eastern Michigan U.) **Passive avoidance as a function of the duration of nonshock confinement.** *Learning & Motivation*, 1970(Feb), Vol. 1(1), 44-51.—Trained 3 groups of female albino Sprague-Dawley rats ($N = 42$) in a step-down passive avoidance situation in which Ss terminated shock when they failed to inhibit for 60 sec. by escaping into a distinctive postshock compartment. The groups spent 5, 15, or 90 sec. in the safe compartment but all had the same 50-min ITI. As predicted, inhibition was inversely related to time spent in the safe area. A 2nd experiment was a $2 \times 2 \times 2$ factorial with sex, postshock confinement (5 vs. 90 sec.) and similarity of the postshock and platform areas as variables. Again the longer postshock period retarded passive avoidance, this time when the ITI approximated the confinement interval. Similarity of the 2 regions was not a relevant variable, casting doubt on an extinction of fear hypothesis and supporting the interpretation that long postshock confinements produce poor performance in passive avoidance because they increase the approach value of the safe region (relaxation, or relief, theory).—*Journal abstract.*

719. Dua, J. K. (U. New England, Armidale, New South Wales, Australia) **Temporal gradients of CS- and UCS-offset in avoidance conditioning.** *Australian Journal of Psychology*, 1970(Dec), Vol. 22(3), 219-224.—Tested 9 groups of 8 male albino rats each in a hurdle-jumping avoidance situation in a 3×3 factorial experiment. The variables tested were 0-, 1-, and 5-sec delays in the termination of CS and UCS after the S had made the hurdle-jumping response. Both the CS and UCS delays were found to have an adverse effect on the learning of avoidance with the longer intervals having more effect. It is concluded that both CS and UCS offset

provide reinforcement for the learning of avoidance.

720. Egger, G. J. & Livesey, P. J. (U. Western Australia, Nedlands) **Acquisition measures in avoidance learning.** *Psychonomic Science*, 1970(Sep), Vol. 20(5), 285-286.—Trained 10 male albino rats to different criteria on a 1-way avoidance task in order to examine the comparability of these various measures of acquisition. On 2 measures of relearning, it was found that Ss trained to a criterion of 10 consecutive avoidances performed better and were significantly less variable than yoked Ss that had either been given the same number of trials or trained to the same number of avoidances. No differences were found in extinction.—*Journal abstract.*

721. Franchina, Joseph J. & Snyder, C. R. (Virginia Polytechnic Inst.) **Effect of patterns of shock and nonshock training trials on response alternation and extinction in escape training.** *Psychonomic Science*, 1970(Nov), Vol. 21(3), 177-179.—In an experiment with 48 female Holtzman albino rats, escape behavior was trained under 100% shock schedules or 50% schedules of shock and nonshock presented in single-alternation, random, or counterbalanced sequences. Terminal acquisition was highest for 100% shock. For 50% schedules, nonshock trial performance was reliably slower for alternation than for random or counterbalanced sequences; shock trial performance showed no reliable pattern effects. In extinction, performance on early trials decreased reliably for all groups except the 50% alternation group.—*Journal abstract.*

722. Garcia, John; Kovner, Richard, & Green, Kenneth F. (State U. New York, Stony Brook) **Cue properties vs palatability of flavors in avoidance learning.** *Psychonomic Science*, 1970(Sep), Vol. 20(5), 313-314.—When a flavor was immediately followed by peripheral shock, Ss learned to use the flavor cue to avoid shock, but ingestion of that flavor was not reduced outside the shock apparatus. Young adult male rats served as Ss in 2 experiments. In contrast, when a flavor was followed by internal illness, Ss rejected that fluid in or out of the situation where illness occurred. However, motor approach to visual cues previously associated with that flavor is not immediately affected. Thus flavor, used as a cue, acquires generalization properties depending upon the subsequent reinforcer and reflecting differential specialization in mechanisms controlling palatability and locomotor responses.—*Journal abstract.*

723. Kamano, Dennis K. (Galesburg State Research Hosp., Ill.) **Effects of a Pavlovian conditioned fear stimulus on avoidance performance attenuated by experimental extinction.** *Psychonomic Science*, 1970(Nov), Vol. 21(3), 187-188.—Studied the effects on avoidance responding of superimposing a fear stimulus (CS+) after the avoidance response had been inhibited by experimental extinction. 3 male Wistar albino rats served as Ss. The CS+, established by coterminous delay conditioning, enhanced the response rate when presented either early in the extinction process or after completion of it. The same result was obtained for enhancement of response rate following CS+ offset.—*Journal abstract.*

724. Keehn, J. D. & Walsh, Maxine. (Addiction Research Foundation, Toronto, Ontario, Canada) **Bar-holding with negative reinforcement as a function of pre- and release-shock intervals.** *Learning & Motivation*, 1970(Feb), Vol. 1(1), 36-43.—Compared the bar-holding behavior of 8 naive male albino rats on a

procedure which allowed only shock escape with their bar-holding behavior on a procedure which allowed both shock escape and shock avoidance at several response-shock intervals. With the escape procedure, shocks were scheduled to recur a number of sec. after a bar-press; with the avoidance procedure, shocks were scheduled to recur a number of sec. after a bar-release. At equal intervals more bar-holding occurred under the avoidance procedure, and amount of bar-holding was inversely proportional to both the bar-press-shock and bar-release-shock intervals.—*Journal abstract.*

725. Maier, Steven F. (U. Illinois) **Failure to escape traumatic electric shock: Incompatible skeletal-motor responses or learned helplessness?** *Learning & Motivation*, 1970(May), Vol. 1(2), 157-169.—Trained 10 experimentally naive mongrel dogs, the passive differential reinforcement of other behavior (DRO) group, to escape electric shock in a Pavlov harness by inhibiting the head movements normally elicited by that electric shock. 10 other Ss, the yoked group, received in the harness inescapable electric shock equivalent to those taken by the passive DRO group. A 3rd group of 10 Ss, the naive control group, received no experience in the harness. All Ss subsequently received escape-avoidance training in a shuttlebox. The passive DRO group learned to escape-avoid in the shuttlebox more slowly than did controls, but eventually learned. In contrast, $\frac{1}{2}$ of the yoked Ss did not learn to escape. The relevance of these results for a theory of learned helplessness is discussed.—*Journal abstract.*

726. McAllister, Wallace R., McAllister, Dorothy E., & Douglass, W. Keith. (Northern Illinois U.) **The inverse relationship between shock intensity and shuttle-box avoidance learning in rats: A reinforcement explanation.** *Journal of Comparative & Physiological Psychology*, 1971(Mar), Vol. 74(3), 426-433.—Shock intensity (.3 or 1.6 ma.) was combined factorially with ITI (15, 30, or 45 sec.) in a shuttle-box avoidance task using 120 female hooded naive rats ($n = 20$ /group). Following 65 avoidance trials, Ss were allowed, in the absence of both shock and the CS, to jump from 1 compartment of the shuttle box to an adjacent safe box. The 1.6-ma groups made significantly fewer avoidance responses than the .3-ma groups but jumped into the safe box with significantly shorter latencies. The latter finding is contrary to an interpretation of the inverse relationship between shuttle-box avoidance learning and shock intensity which is based on freezing responses but supports a reinforcement interpretation which emphasizes the role of fear of situational cues. (22 ref.)—*Journal abstract.*

728. Padilla, A. M., Padilla, Christine; Ketterer, Terry, & Giacalone, Diane. (State University Coll. New York, Potsdam) **Inescapable shocks and subsequent escape/avoidance conditioning in goldfish, *Carassius auratus*.** *Psychonomic Science*, 1970(Sep), Vol. 20(5), 295-296.—Conducted 2 experiments with 20 and 50 naive goldfish, *Carassius auratus*, respectively, to assess the effects of inescapable shocks on subsequent escape/avoidance conditioning. Results indicate that inescapable shock presentations interfere with later

avoidance training when Ss are tested 0, 24, and 48 hr. following inescapable shocks. However, the interference effect dissipates with time so that in 72 hr. Ss are capable of avoiding shock. Findings confirm the cross-species generality of the interference effect.—*Journal abstract.*

729. Powell, Robert W. & Mantor, Harry. (U. South Florida) **Shaping of free-operant avoidance in the wood rat, (*Neotoma floridana*).** *Psychonomic Science*, 1970(Sep), Vol. 20(5), 263-265.—Uses a shaping procedure with 5 wild wood rats to initiate leverpressing under a free-operant avoidance procedure. Ss eventually developed very effective avoidance, but much higher shock intensities were required than have been employed with domesticated rats to produce similar behavior. Ss did not display warm-up during avoidance, with shocks being rather evenly distributed over time.—*Journal abstract.*

730. Pryor, Gordon T. (Stanford Research Inst., Menlo Park, Calif.) **Escape thresholds to electric shock using a conditioned pole-displacement response in rats.** *Psychonomic Science*, 1970(Sep), Vol. 20(5), 305-306.—72 naive male Long-Evans rats were 1st taught to displace a pole in order to escape a 1-ma shock to the feet. During a subsequent test session, 60 random presentations of several intensities of shock were used to generate psychophysical response curves and estimate escape thresholds. The median escape threshold for 48 Ss was .18 ma. using this procedure. Results are compared to other threshold procedures designed to assess the aversiveness of electric shock.—*Journal abstract.*

731. Rahwan, Ralf G. & Kulkarni, A. S. (Dow Chemical Co., Human Health Research & Development Lab., Zionsville, Ind.) **Age- and sex-related differences in acquisition of a long-term active avoidance response in mice.** *Psychonomic Science*, 1970(Nov), Vol. 21(3), 170-171.—Studied 498 1-12 mo. old albino NCR Swiss mice. A significantly higher level of acquisition of an active jump-out avoidance response was achieved by 3-, 6-, and 12-mo-old male Ss as compared to 1-mo-old Ss. No such age-related differences in performance could be demonstrated in female Ss. 1-mo-old female Ss, however, achieved significantly higher avoidance levels than did males of the same age. The possible role of sex hormones in brain maturation and the tendency of male mice to "freeze" in such a training paradigm are discussed.—*Journal abstract.*

732. Rless, Dave. (Galesburg State Research Hosp., Ill.) **The buzzer as a primary aversive stimulus: I. Unconditioned acceleration and summation of conditioned and unconditioned acceleration.** *Psychonomic Science*, 1970(Nov), Vol. 21(3), 167-169.—Presented 7 male Wistar rats with 1-min buzzer presentations during Sidman avoidance sessions. 4 Ss with a classical conditioning history (light-shock pairings) were also given light presentations alone and light-buzzer presentations during avoidance. The buzzer presentations increased avoidance rates (unconditioned acceleration) and the light-buzzer compound increased rates even further than either stimulus alone (summation effect).—*Journal abstract.*

733. Roberts, A. E., Greenway, L., & Hurwitz, H. M. (Catawba Coll.) **Extinction of free-operant avoidance with and without feedback.** *Psychonomic Science*, 1970(Sep), Vol. 20(5), 283-285.—Studied extinction of free-operant avoidance behavior of 6 adult female hooded rats under conditions in which a response either resulted in a response-contingent event (feedback) or had

no scheduled consequence. Probes and the original conditions of training were alternated. The time to reach the criterion of extinction and the number of responses in extinction were greater when a feedback stimulus was available. Cyclic patterns of responding were observed during both free-operant avoidance and extinction. (18 ref.)—*Journal abstract*.

734. Seligman, Martin E. (Cornell U.) **For helplessness: Can we immunize the weak?** *Psychology Today*, 1969(Jun), Vol. 3(1), 42-44.—Dogs that receive inescapable electric shock do not later learn to escape shock even when it is possible. However, dogs that learn to escape shock who then experience inescapable shock, continue to escape the shock whenever possible. The pretraining with escapable shock seemed similar to an inoculation, giving animals immunity from becoming helpless. Parallels to human behavior suggest that it may be possible to prepare people so that they do not react to failure with total helplessness.—*E. J. Posavac*.

735. Spelt, Philip F. (Wabash Coll.) **Facilitation of shuttle avoidance by handling.** *Psychonomic Science*, 1970(Nov), Vol. 21(3), 164-165.—3 groups of 6 male Holtzman albino rats received shuttle, shuttle + handling, or 1-way shock avoidance training with a tone CS. Results show that the 2-way handled group reached a performance level significantly superior to that of the nonhandled shuttle group. These results, and those of other studies, suggest that the use of a warning stimulus, prior to and distinct from the CS, might serve to enhance performance in the standard shuttle-avoidance task.—*Journal abstract*.

Reinforcement

736. Brimer, C. J. (Dalhousie U., Halifax, Nova Scotia, Canada) **Inhibition and disinhibition of an operant response as a function of the amount and type of prior training.** *Psychonomic Science*, 1970(Nov), Vol. 21(3), 191-192.—Employed a total of 132 male hooded rats in 2 experiments designed to investigate the effect of an extraneous stimulus (light) presented at different stages of extinction. Ss were initially trained with either a CRF or variable interval (VI) food-reinforcement schedule. Presenting the light early in extinction led to inhibition in the CRF Ss and disinhibition in the VI Ss. Later in extinction both groups showed the disinhibition effect. Results suggest that the low response rate necessary to demonstrate disinhibition is a function of both the amount and type of original reinforced training.—*Journal abstract*.

737. Campbell, Edward M. & Meyer, Philip A. (U. South Dakota) **Effects of daily reward sequence on simultaneous and successive negative contrast in rats.** *Journal of Comparative & Physiological Psychology*, 1971(Mar), Vol. 74(3), 434-440.—Investigated the role of sequence in simultaneous negative contrast effects (NCEs). 2 groups of naive albino Sprague-Dawley rats ($n = 10$) were differentially conditioned for 84 trials in a black-white runway for large (L) and small (S) reward. Group SL received no daily L-S transitions; Group LS received no daily S-L transitions. Subsequently, Ss received 15 S trials in their former L runway. Only Group LS evidenced both simultaneous and successive NCEs relative to a small-reward control group (Group SS). Results are interpreted as suggesting the importance of sequential variables in NCEs involving differential conditioning. The implications for both the sequential

hypothesis and frustration theory are discussed.—*Journal abstract*.

738. Di Lollo, Vincent & Allison, James. (U. Western Australia, Nedlands) **Relative magnitude of end-box reward: Effects upon performance throughout the double runway.** *Journal of Experimental Psychology*, 1971(Feb), Vol. 87(2), 248-254.—Gave 2 groups of 24 male albino Holtzman rats 52 acquisition trials and 32 shift trials in a homogeneous black double runway to test the hypothesized similarity between double runway and differential conditioning situations. During acquisition, the control group received 2 45-mg pellets in each goal box; the experimental group received 2 pellets in the 1st box and 10 pellets in the 2nd. During shift, all Ss received 2 pellets in each box. Both groups ran faster in the 1st than in the 2nd runway. In acquisition, both groups ran at the same speed in the 1st runway, but experimentals ran faster than controls in the 2nd runway. A negative contrast effect, confined to performance in the 2nd runway, was obtained during shift. A 2nd experiment, using a black 1st runway and a white 2nd runway, obtained similar results, except that during acquisition the experimental group ran faster than controls in both runways. The relevant results uniformly contradicted the hypothesis. (19 ref.)—*Journal abstract*.

739. Keehn, J. D., Colotta, Victor A., & Beaton, John M. (York U., Downsview, Ontario, Canada) **Palatability as a factor in the duration and pattern of schedule-induced drinking.** *Psychological Record*, 1970(Fal), Vol. 20(4), 433-442.—When bar-pressing was reinforced with 45-mg Noyes pellets scheduled once/min on the average 3 male Wistar albino rats drank more when .4% saccharin was freely available than when the fluid was plain water. They consumed more saccharin than water under extinction (EXT) conditions also, but not under a CRF schedule. Saccharin consumption was less under CRF than under EXT, in accord with the observation that water-drinking occurs only immediately after eating (postpellet), but that saccharin-drinking occurs on other occasions in addition (interpellet). Postpellet drink durations of saccharin and of water were relatively stable within sessions, but interpellet drinking was erratic. Apparently palatability is not a factor in the postpellet drinking responsible for schedule-induced polydipsia, but is a stimulus for drinking in addition to that which is schedule-induced.—*Journal abstract*.

740. Schoel, W. Michael; Davis, Jennifer, & Bitterman, M. E. (U. South Florida) **Adventitious reinforcement in free-operant discrimination.** *Behavior Research Methods & Instrumentation*, 1971(Jan), Vol. 3(1), 8-9.—Found that the discriminative performance of rats trained under conditions in which their responses to S- postponed the appearance of S+, both for themselves and for yoked-control Ss, was superior to the performance of the controls in 2 rather different experiments with 8 albino and 10 hooded rats, respectively. Results demonstrate the pervasiveness of adventitious reinforcement in free-operant discrimination.—*Journal abstract*.

Reinforcement Schedule

742. Capaldi, E. J., Capaldi, Elizabeth D., & Kassover,

Kenneth. (Purdue U.) **An instrumental partial reinforcement effect in the absence of any overt instrumental acquisition training.** *Psychonomic Science*, 1970(Nov), Vol. 21(3), 145-147.—Placed 70 naive male Holtzman rats directly over a food cup or in ordinary runway trials under either partial or consistent food reward, no other acquisition training having been given. Also included was a group that was nonrewarded on all running trials. A gradient occurred in extinction such that type of acquisition training (placed vs. run) exercised less influence over performance, and schedule of reward (partial vs. continuous) exercised more influence over performance both as extinction training progressed and as the goal section was approached. Results suggest that rats make small terminal instrumental reactions on placement trials, reactions which, if strongly conditioned, can support a PRE in the full instrumental reaction, particularly in the goal area. *Journal abstract.*

748. Sgro, Joseph A., Showalter, John R., & Cohn, Neil H. (Virginia Polytechnic Inst.) **Frustration effect following training with continuous and partial delay of reward.** *Journal of Experimental Psychology*, 1971(Mar), Vol. 87(3), 320-325.—Trained 4 groups of 12 male albino rats for 54 trials with either continuous delay, partial delay, continuous reward, or partial reward in the 1st goalbox of a double alleyway. All Ss were then shifted to partial reward in Goalbox 1 for an additional

42 trials. During preshift delay exerted an inhibitory effect on both Alley 1 and Alley 2 speeds. During the postshift session, a significant Preshift Groups \times Goalbox 1 Reward condition interaction for Alley 2 running speeds indicated that speeds following non-rewarded Goalbox 1 trials were depressed for the previously delayed groups. Data are discussed within a frustration-competing response interpretation. *Journal abstract.*

749. Stretch, R., Orloff, E. R., & Gerber, G. J. (U. Western Ontario, London, Ontario, Canada) **Multiple interruptions of responding maintained by a fixed-interval schedule of electric-shock presentation in squirrel monkeys.** *Canadian Journal of Psychology*, 1970(Apr), Vol. 24(2), 117-126.—Recent experiments have demonstrated that the characteristic pattern of responding engendered by a fixed-interval (FI) schedule of food reinforcement can also be established and maintained by response-contingent electric shocks. Under an FI schedule of food presentation, the characteristic pattern of responding survives repeated interruption by stimulus conditions absent at the time of reinforcement. The present experiment, with 3 male squirrel monkeys, demonstrates a similar phenomenon under circumstances in which the sole consequence of FI responding was the delivery of response-contingent shocks. Several possible interpretations of FI performance maintained by electric-shock presentation are discussed. (15 ref.) (French summary.) *Journal abstract.*

750. Walker, S. F., Schnelle, J., & Hurwitz, H. M. (U. Tennessee) **Rates of concurrent responses and reinforcer duration.** *Psychonomic Science*, 1970(Nov), Vol. 21(3), 173-175.—Rewarded 6 male Long-Evans rats concurrently, at equal frequencies, for pushes at the doors in front of 2 reinforcement magazines. The duration of the reinforcer given at 1 magazine was constant, while the reinforcer duration at the other magazine was changed every 6 sessions. For 3 Ss the constant reinforcer was 3 sec. and for 3 other Ss the constant reinforcer was 1 sec. For all Ss the duration of the alternative reinforcer was varied between 1 and 5 sec. Rate of response at the magazine that delivered the constant reinforcer duration was found to vary inversely with the duration of the reinforcer obtained at the alternative magazine. The matching of relative response rate to relative reinforcer duration was poor. Results are attributed partly to the general rate-suppressing effects of long reinforcer durations. *Journal abstract.*

752. Wolach, Allen H., Counts, Maureen, & Adelman, Morris. (Illinois Inst. of Technology) **Sequenced reinforcement in a two-way runway situation.** *Psychonomic Science*, 1970(Sep), Vol. 20(5), 267-269.—Tested E. J. Capaldi's sequential response hypothesis (see PA, Vol. 37:6381 and 39:4421) with a within-S experimental design. A 2-way runway situation made it possible for Ss to experience 1 sequence of reinforcements and non-reinforcements while running in 1 direction and another sequence while running in the opposite direction. The direction in which Ss ran alternated from trial to trial. The sequences Ss experienced in the 2 directions were an N-length of 3 (always 3 nonreinforced trials before a reinforced trial) or N-lengths of 1, 2, and 3 (either 1, 2, or 3 nonreinforcements before a reinforced trial). Greater

resistance to extinction occurred in the direction that was associated with N-lengths of 1, 2, and 3. 14 naive Sprague-Dawley rats were Ss.—*Journal abstract.*

Punishment & Extinction

753. Brown, Judson S. (U. Iowa) **Self-punitive behavior with a distinctively marked punishment zone.** *Psychonomic Science*, 1970(Nov), Vol. 21(3), 161-163.—Investigated self-punitive locomotor behavior in rats in which the distinctiveness of the punishment zone was manipulated in 2 studies with 16 male hooded rats. Contrary to a discrimination hypothesis, conditions designed to enhance the discriminability of the punishment region failed to produce a decrement in vicious-circle behavior. It is suggested that increasing the distinctiveness of the punishment region may either weaken self-punitive behavior, leave it unaltered, or strengthen it. Which results occur is believed to depend upon the general efficacy of other variables e.g. shock intensity, shock location, and training.—*Journal abstract.*

755. Haha, Martin E., Morrison, Bruce J., Simmel, Edward C., & Harris, Connie J. (State U. New York, Binghamton) **Atypical effects of electroshock on emotionality in rats.** *Psychonomic Science*, 1970(Nov), Vol. 21(3), 159-160.—Examined a unique property of shock, i.e., the absence of a clearly perceivable source of the stimulus. 24 male and female Sprague-Dawley rats were divided into 3 groups: object alone, shock alone, and shock + object. Using 3 open-field measures of emotionality, it was found that the group shocked without an object present was significantly more emotional than the group shocked with an object present or the group presented with the object only. It is concluded that Ss who employ shock should control for its means of delivery if the effects of that shock on behavior are being investigated.—*Journal abstract.*

756. Lambert, Joseph V. (Temple U.) **The effect of disconfirming an expectancy of time-out from shock in the double runway.** *Psychonomic Science*, 1970(Nov), Vol. 21(3), 153-154.—Describes a previous experiment in a double-runway apparatus using shock escape as the reinforcement by J. V. Lambert and B. J. Hammond. Results show that the Amsehan frustration effect (FE) manifests itself as a marked slowing down in the 2nd runway, when an expected relief from shock is not forthcoming. The present experiment with 16 male Sprague-Dawley rats was performed to determine if S builds up a particular expectancy of timeout from shock and what the effect might be of disconfirming this expectancy by giving a substantially shorter period of shock relief. The reversed FE again appeared when a particular expectancy of timeout from shock was disconfirmed. Also, Runway 1 speeds were seen to decrease when this frustration treatment was introduced.—*Journal abstract.*

757. Matos, Maria A. (Columbia U.) **Acquisition and extinction of conditioned suppression in the rhesus monkey as a function of probability of unavoidable shock.** *Dissertation Abstracts International*, 1970(Oct), Vol. 31(4-B), 2318.

758. Nyström, Mats. (Lund U., Psychological Lab., Sweden) **The development of stimulus preferences in**

the pecking behaviour of young herring gulls (*Larus argentatus*): VI. The effects of extinction. *Psychological Research Bulletin, Lund U.*, 1970, Vol. 10(10), 3 p.—Studied extinction of the pecking response to different colored stimuli in 40 neonatal herring gulls. Results verified previous findings of psychophysiological investigations of habituation or disinhibition, stimulus generalization, and spontaneous recovery. Divergent findings were (a) stable level in the middle of the extinction series, (b) flat regression to red stimulus, and (c) lack of differences between massed and spaced trial distributions. The motivation models based on the principle of continuous loading of some kind of reaction specific energy are not supported. The adaptive value of the responses are discussed. (20 ref.)—*Journal abstract.*

759. Reiss, Dave. (Galesburg State Research Hosp., Ill.) **Secondary self-punitive behavior: Effects of periodic punishment of Sidman avoidance by Pavlovian CS+.** *Psychonomic Science*, 1970(Nov), Vol. 21(3), 185-187.—Trained 7 naive Wistar albino rats on Sidman avoidance. Following adaptation to 3-sec response-contingent light presentations, Ss received alternate days of variable interval 3-sec classical conditioning in which the light was paired with shock. During testing, the unreinforced light CS was response produced during short periods of the avoidance sessions. Acceleration of avoidance (secondary self-punitive behavior) resulted during these periods. Pavlovian extinction resulted in its rapid attenuation, and Pavlovian reconditioning produced immediate recovery. Mean interresponse times increased linearly as a function of the number of previously punished responses suggesting that the phenomenon is sufficiently delicate that response suppression would probably result if the punishment periods were prolonged. (19 ref.)—*Journal abstract.*

761. Terhune, James G. & Premack, David. (U. California, Santa Barbara) **On the proportionality between the probability of not-running and the punishment effect of being forced to run.** *Learning & Motivation*, 1970(May), Vol. 1(2), 141-149.—Punished drinking in 4 thirsty female Sprague-Dawley rats by forcing each S to run in a motor-driven wheel for a fixed duration upon completion of Slicks. Durations of forced running were converted into a probability of not-running on the basis of a prior and independent measure of the conditional probability that S would not be running at t + n sec. given that it had started at t. Drinking was suppressed when licking forced the thirsty S to run for a short duration. Furthermore, the degree to which the initiation of a drink was suppressed was seen to be a linear function of S's probability of not being in a state of forced running.—*Journal abstract.*

762. Thompson, David W. & Adelman, Morris. (Illinois Inst. of Technology, Chicago) **Extinction following the differential control of a conditioned positive reinforcer.** *Psychonomic Science*, 1970(Nov), Vol. 21(3), 158-159.—Administered CRF to 60 male Sprague-Dawley rats in a lever chamber with water as a primary reinforcer and a water-dipper click as a secondary reinforcer. Ss were then given extinction with no primary or secondary reinforcement. The lever was then removed. Ss were divided into 5 groups which

experienced the following contingencies: (a) placement in the chamber without shock, (b) dipper-click presentations, (c) shock presentations, (d) click and shock presentations that were not contingent on each other, and (e) forward conditioning click-shock pairings. All groups were then given extinction with the click following each response. The groups aligned themselves in extinction from a-e, with e Ss showing the least resistance to extinction. Significant differences in extinction were found between the shock and no-shock groups.—*Journal abstract.*

763. Thompson, Richard W. & Higbee, Mark. (Western Washington State Coll.) **Shock intensity and unconditioned responding in the gerbil.** *Psychonomic Science*, 1970(Sep), Vol. 20(5), 292-293.—Tested 6 male gerbils for their UCR to shock (.0-.9 ma. in .1-mA steps) before and after shaving the tail, feet, and scrotum. Results indicate that Ss were more sensitive after shaving than before. Ss under both conditions made flinch responses at low intensities of shock, reaching a maximum of .1 ma. and then declining. Ss under both conditions showed an increase in locomotor responses from .0-.9 ma. The response topographies for both the flinch and locomotor responses were similar to those of the rat, but were displaced toward low shock intensities.—*Journal abstract.*

764. Tombaugh, J. W. & Tombaugh, T. N. (Carleton U., Ottawa, Ontario, Canada) **Effects on performance of placing a visual cue at different temporal locations within a constant delay interval.** *Journal of Experimental Psychology*, 1971(Feb), Vol. 87(2), 220-224.—Studied the effects of presenting cues at different times within a 7.5-sec delay of reinforcement interval during the acquisition and extinction of a bar-press response by 72 naive female albino Sprague-Dawley rats. In acquisition, the 3 following types of temporal placements were used: (a) a cue presented only at the beginning of the delay interval, (b) a cue occurring throughout the duration of the delay interval, and (c) a cue which was presented only at the end of the interval. In extinction, each group was divided so that $\frac{1}{2}$ of the group received the cue condition and $\frac{1}{2}$ did not. In addition, a no-cue control group was employed in both acquisition and extinction. In acquisition and extinction, the cue conditions tended to produce shorter latencies than did the no-cue conditions. Extinction data further indicate that the greatest resistance to extinction was produced when the offset of the cue was associated with the end of the delay interval. A secondary reinforcement interpretation is advanced to explain these results.—*Journal abstract.*

SOCIAL & SEXUAL BEHAVIOR

765. Alexander, B. K. (U. Oregon, Portland) **Parental behavior of adult male Japanese monkeys.** *Behaviour*, 1970, Vol. 36(4), 270-285.—Analyzed seasonal variations in the parental behavior of male Japanese monkeys with respect to stimulus and physiological factors and with respect to the role of male play in the socialization of the young. The troop was housed on a 2-acre corral in Oregon. Records were kept of affiliative, agonistic, and play behavior during the lactation, breeding, pregnancy, and birth "seasons." Play and affiliative interactions between adult males and juveniles peaked during the pregnancy and birth seasons. Such interactions, however, may be viewed as a manifestation

of a general incremental trend, since play and affiliative increments also occurred toward other adults. During the 1st 3 mo. of life, adult males provided virtually all the agonistic experience for the young. It is suggested that seasonal withdrawal of androgen may increase affiliative behavior and that, the early punitive relationship, though mild, may be important in establishing the authority of dominant males among the young. (German summary)—S. R. Goldstein.

767. Boice, Carol & Boice, Robert. (U. Missouri) **Precedence in feeding and mounting in captive toads.** *Psychonomic Science*, 1970(Sep), Vol. 20(5), 259-260.—Forced 4 groups of captive toads (*Bufo americanus*) (total N=40) in a sexually active state to compete for mealworms as food. Development of resultant feeding hierarchies appeared retarded relative to prior research. Males remained in amplexus for several days during which they did not eat. Systematic preferences for females were not apparent, although males who mounted frequently also ranked high in frequency of aggressive behavior.—*Journal abstract.*

768. Cairns, Robert B. & Nakelski, Joseph S. (Indiana U.) **On fighting in mice: Ontogenetic and experiential determinants.** *Journal of Comparative & Physiological Psychology*, 1971(Mar), Vol. 74(3), 354-364.—Isolated 64 C57BL/10 male mice at 30 days of age or reared them in small groups. Isolated Ss initiated more social-investigation behaviors, were more reactive to dyadic stimulation, and were more likely to attack another mouse than were group-reared mice. These differences were eliminated in adulthood by placing isolate-reared Ss into small groups for an additional 5-10 wk. Observations of test and home-cage interactions indicate that (a) continued exposure to the physical-cutaneous stimulation of others serves to decrease reactivity to such stimulation, (b) heightened reactivity increases the likelihood that dyadic investigatory activity will escalate into fighting, and (c) the effects of early social experiences associated with fighting can be reversed.—*Journal abstract.*

772. Lynch, James J. (U. Maryland, Medical School, Baltimore) **Psychophysiology and development of social attachment.** *Journal of Nervous & Mental*

Disease, 1970(Oct), Vol. 151(4), 231-244.—Reviews some of the genetic, developmental, and conditional origins of canine social attachment to the human, prompted by research reporting large magnitude physiological responses in dogs during social interaction with humans, and by studies demonstrating that the human, especially through tactual contact, can markedly reduce and even eliminate a dog's behavioral and physiological responses elicited by conditioned fear and painful stimuli. The usefulness of this research paradigm in clarifying the physiological substrata of socialization and social interactions are discussed. The understanding of this socio-physiological need system is considered vital in light of the growth of technology, which may be distorting basic sociophysiological processes. To evaluate the effects of TV, teaching machines, medical technology, etc., the physiological correlates of social attachments must be understood. (60 ref.)—*Journal abstract*.

774. Mosig, Dirk W. & Dewsbury, Donald A. (U. Florida) **Plug fate in the copulatory behavior of rats.** *Psychonomic Science*, 1970(Sep), Vol. 20(5), 315-316.—Collected normative data on the fate of ejaculatory plugs following a total of 162 ejaculations attained by 18 male Long-Evans rats each given 3 tests. 69% of the plugs were dislodged, 82% of these after 3 or fewer intromissions. Males ate a total of 65% of the plugs, whereas females ate none. More than 1/2 of the plugs consumed were consumed between the time of dislodging and the next intromission. Plug consumption is a behavioral pattern appropriate for further study.—*Journal abstract*.

775. Mosig, Dirk W. & Dewsbury, Donald A. (U. Florida) **The behavior of rats during copulation as a function of prior copulatory experience.** *Psychonomic Science*, 1970(Nov), Vol. 21(3), 141-143.—Compared the behavioral patterns accompanying the copulatory behavior of 9 male Long-Evans rats with no prior adult copulatory experience with those of 9 Ss that had experienced 4 prior tests. Age was controlled. Effects of experience on standard measures of copulatory behavior were similar to those in earlier work. There were no significant differences in other behavioral patterns as a function of experience. The tendency to display various behavioral patterns during copulatory activity appears to be completely formed prior to the 1st such activity and generally unaffected by adult copulatory experience.—*Journal abstract*.

776. Payne, A. P. & Swanson, H. H. (U. Birmingham, England) **Agonistic behavior between pairs of hamsters of the same and opposite sex in a neutral observation area.** *Behaviour*, 1970, Vol. 36(4), 259-269.—Investigated the agonistic behavior of adult hamsters to identify physical and behavioral factors correlated with dominance and submissiveness in pair encounters. In addition, female dominance over the male was studied in relation to both the estrous cycle and ongoing male behavior. Using a round-robin comparison technique it was found that when agonistic behavior occurred the majority of cases were decided by ritualized sparring displays. In addition, a high positive correlation was found between weight and aggressive success for both sexes, even in the absence of actual fighting. During male-female encounters, in which the pair were equated

for weight, agonistic behavior, which was primarily female-initiated, occurred on nonestrous days during which time there was an increase in male cage marking. It is suggested that during the estrous cycle the females' unreceptive state may be communicated to the male by aggressive behavior rather than by olfactory stimuli. (German summary) (16 ref.)—S. R. Goldstein.

777. Pearce, Burnard L. (U. Oklahoma) **The effects of space, estrus, and coalitions upon the dominance hierarchy of mature, long-term associate, captive chimpanzees.** *Dissertation Abstracts International*, 1970(Nov), Vol. 31(5-B), 2963-2964.

778. Stern, Jeffrey J. & Bronner, Gayle. (U. Michigan, Dearborn) **Effects of litter size on nursing time and weight of the young in guinea pigs.** *Psychonomic Science*, 1970(Nov), Vol. 21(3), 171-172.—Observed 15 female guinea pigs with their offspring for 28 days postpartum. The larger the litter (1-4 animals), the greater the percentage of nursing time. With the exception of the 4 animal litters, the smaller the litter, the greater the weight of the young. There was no relationship between litter size and the number of positive or negative nursing responses directed toward each pup.—*Journal abstract*.

779. Tarantino, S. J. (Florida Atlantic U.) **Effect of cage confinement on social behavior in squirrel monkeys.** *Psychonomic Science*, 1970(Sep), Vol. 20(5), 294-295.—Obtained data on the effects of cage confinement in 6 squirrel monkeys as part of a larger study on social perception. Approach-withdrawal behavior was studied at 3 intervals over a 6-mo period, during which the Ss were confined in individual cages. At the 6th mo. a noticeable change in behavior occurred. During 20-min test intervals the Ss displayed very strong attachment behavior. This was in marked contrast to their earlier behavior.—*Journal abstract*.

780. Westby, G. W. & Box, Hilary O. (U. Reading, England) **Prediction of dominance in social groups of the electric fish, *Gymnotus carapo*.** *Psychonomic Science*, 1970(Nov), Vol. 21(3), 181-183.—Examined the electrical and other behavioral interactions within 22 different pairs of 8 adult *Gymnotus carapo*. High scores on aggressive behavior were inversely related to the time spent in electrical silence. Approach and threat movement scores were positively correlated. There was a perfect positive correlation between electrical pulse frequency and subsequent display of threat movements in social encounters. Results confirm a suggestion that dominance in this type of social grouping can be reliably predicted from the electrical characteristics of the interacting individuals. (16 ref.)—*Journal abstract*.

SENSORY PROCESSES

785. Hansson, S. Birger. (Lund U., Psychological Lab., Sweden) **Visual depth discrimination in young eiders (*Somateria mollissima*).** *Psychological Research Bulletin*, Lund U., 1970, Vol. 10(13), 16 p.—Investigated visual depth discrimination in young eiders by means of a "visual cliff." All Ss were visually deprived from birth. Choice trials examined the reactions of 7 naive Ss, 20 Ss with exposure to the shallow side, and 21 Ss exposed to the deep side of the cliff. Choices, latency-times, and behavioral manifestations were noted. Naive Ss preferred the shallow side, while the other Ss tended to choose in accordance with the type of exposure they had experienced. Results are discussed in terms of inborn tendencies and rival learning signals.—*Journal abstract*.

786. Mitchell, Curt; Gillette, Richard; Vernon, Jack, & Herman, Paul. (U. Oregon, Medical School, Portland) **Pure-tone auditory behavioral thresholds in three species of lemurs.** *Journal of the Acoustical Society of America*, 1970(Aug), Vol. 48(2, Pt. 2), 531-535.—Determined absolute thresholds for pure tones of frequencies 100 Hz. to 40 kHz. by the method of constant stimuli using a 2-bar operant technique. 6 lemurs of 3 subspecies were trained to press a white bar to turn on a tone lasting 5 sec. During the tone, a single press on a 2nd (black) bar resulted in food reward. Failure to respond simply terminated the trial. Response in the absence of tone was scored as a false positive response and resulted in a 1/2-sec shock of from .6-1.3 mA. Thresholds, based on a response probability of .5, indicate a lesser sensitivity in the low and middle frequencies than found in the anthropoid primates, but an apparent extension of sensitivity into the higher frequencies beyond the upper-frequency cutoff points found for the anthropoids. (16 ref.)—*Journal abstract*.

788. Taub, Harvey B. & Raab, David H. (Brooklyn Coll., City U. New York) **Fluctuations of N_1 amplitude in relation to click-intensity discrimination.** *Journal of the Acoustical Society of America*, 1969(Oct), Vol. 46(4,

Pt. 2), 969-978.—Recorded round-window potentials evoked by clicks from 11 female Hartley anesthetized guinea pigs. By comparing N_1 amplitudes on line, it was possible to compute physiological DLs for click intensity. The method requires no assumptions about the underlying distributions of neural effect. Weber functions were generated with and without a continuous masking noise. The effects of click intensity and of background noise paralleled those previously reported for human listeners. A neural model is described in which variability of N_1 amplitude turned out to be the principal parameter. (16 ref.)—*Journal abstract*.

DEVELOPMENTAL PSYCHOLOGY

789. Albott, William L. & Bruning, James L. (Ohio U.) **Given names: A neglected social variable.** *Psychological Record*, 1970(Fal), Vol. 20(4), 527-533.—Reviews the literature regarding guidelines used in the assignment of names and the eventual impact which particular names have on the bearers. Connotative meanings were concluded to affect not only name choice but also self-perceptions, personality development, and behavior patterns in both children and adults. The failure to consider names as independent variables may account for the present lack of empirical research. (27 ref.)—*Journal abstract*.

790. Anandalakshmy, S. & Grinder, Robert E. (U. Wisconsin) **Conceptual emphases in the history of developmental psychology: Evolutionary theory, teleology, and the nature-nurture issue.** *Child Development*, 1970(Dec), Vol. 41(4), 1113-1123.—Discusses the history of developmental psychology in this century within the framework of 3 major trends—evolutionary theory, teleology, and the nature-nurture issue. Perspectives of early theorists, Hall, Thorndike, Gesell, and Watson, are considered in their historical context; and shifts in emphases of later writers are examined. While teleology and evolutionary theory are shown to be significant mainly in being the source of early theoretical concepts, the nature-nurture issue is discussed as a continuing controversy. (37 ref.)—*Journal abstract*.

791. Bailey, Kent G. & Gibby, Robert G. (Virginia Commonwealth U., Richmond) **Developmental differences in self-ratings on intelligence.** *Journal of Clinical Psychology*, 1971(Jan), Vol. 27(1), 51-54.—112 6th graders and 124 12th graders were administered an intelligence test and the Gibby Intelligence Rating Schedule. The results supported the contention that significant developmental differences exist between 6th and 12th graders. 6th graders were more discrepant in their self-ratings and less realistic in estimating their intelligence than 12th graders. Self-ratings of the 12th graders on the Self Test correlated significantly with their IQ but this was not the case for 6th graders. It is concluded that 6th and 12th graders do differ in their self-evaluations on intelligence.—E. J. Kronenberger.

792. Bradley, Paul A., Hoepfner, Ralph, & Guilford, J. Paul. (U. Southern California, Psychological Lab.) **A factor analysis of figural-memory abilities.** *Reports from the Psychological Laboratory, University of Southern California*, 1969(Jun), No. 43, 32 p.—Attempted to demonstrate that 6 visual-figural-memory abilities, hypothesized from structure-of-intellect theory, were distinct from one another and from 10 other abilities by means of 26 new tests designed for the figural-memory

abilities, and 24 marker tests for the reference factors for the other abilities. The test battery was administered to 202 high school students. From the test intercorrelations, 18 principal factors were extracted and rotated to psychological meaningfulness. The 6 hypothesized factors for the 6 figural-memory abilities were well determined, each with 2 or more univocal tests from those designed for the respective abilities. Discriminations from 4 memory factors in the symbolic and semantic categories, 3 figural-cognition factors, 3 production factors, and factors for verbal IQ and sex were fairly good. Thus, the picture of a distinct memory category, constituted as in structure-of-intellect theory, is more firmly established.—*Journal abstract.*

793. Hoving, Kenneth L., Morin, Robert E., & Konick, Dorothy S. (Kent State U.) **Recognition reaction time and size of the memory set: A developmental study.** *Psychonomic Science*, 1970(Nov), Vol. 21(4), 247-248. —Tested 9 male and 9 female kindergartners, 4th graders, and undergraduates on a recognition RT task with memory sets of 2, 3, and 4 items. Though overall RT varied with age, the slopes of the functions relating RT to size of the memory set did not differ significantly as a function of age. Within the context of a theory of recognition memory developed by S. Sternberg (see PA, Vol. 40 10810), results suggest that young children scan memory for familiar pictures as quickly as do adults.—*Journal abstract.*

794. Matulová, Nina & Švancara, Josef. (Purkyne U., Brno, Czechoslovakia) **Zvláštnosti "sociální percepce" v předškolním věku a ve starší.** [Features of "social perception" in preschool and old age.] *Psychológia a Patopsychológia Dieťaťa*, 1970, Vol. 5(3), 209-216.—Studied the development of the ability to interpret facial expression and to differentiate basic characterologic concepts. Methods used were S. G. Vandenberg's Multiple Choice Vocabulary Test and Experimental Test of Social Perception as measured by the interpretation of facial expressions. The 1st stage of the study was represented by 40 preschoolchildren with a mean age of 5.7 yr. and 41 Ss with a mean age of 78.7 yr. While the children did not significantly differ from the adults in recognizing the portraits, there was a marked superiority of the adults in the test of characterologic concepts and in the interpretation of emotional expressions. High intercorrelation between the 2 methods was present in the adults but not in the children. Some indicators showed statistically significant sexual differences. Both Vandenberg's methods appear to be practicable for use with preschoolchildren. The irregular dispersion of the findings, however, suggest a regroupment of the items. (Russian summary)—*English summary.*

795. Miller, Edgar. (U. Hull, England) **Handedness and the pattern of human ability.** *British Journal of Psychology*, 1971(Feb), Vol. 62(1), 111-112.—Examined the visuo-spatial and verbal functions of right- and mixed-handed Ss in order to clarify the opposite findings of J. Levy and M. Annett. 29 right-handed and 23 mixed-handed undergraduates were administered the National Institute of Industrial Psychology (NIIP) Group Test 33 (verbal intelligence) and NIIP Form Relations Test (visual manipulation of shapes in 2 and 3 dimensions). Ss had almost identical mean scores on the verbal test, while right-handed Ss scored significantly higher on the spatial test. The findings of J. Levy are supported. It is concluded that "real differences in ability

between right- and mixed-handers do exist and probably reflect underlying differences in the asymmetrical organization of functions within the brain."—S. Knapp.

796. Nance, R. Dale. (U. Wisconsin, Milwaukee) G. Stanley Hall and John B. Watson as child psychologists. *Journal of the History of the Behavioral Sciences*, 1970(Oct), Vol. 6(4), 303-316.—Compares and contrasts Hall's and Watson's views with respect to child psychology. If Watson's personal "hang-ups" colored his suggestions about child rearing, Hall's wordiness and naive optimism about man's future may be equally taken to task.—C. M. Franks.

797. Siddiqui, Jawaid & Keil, Wolfgang. (U. Mainz Inst of Psychology W. Germany) **Neugierverhalten in der Sprache.** [Exploratory behavior aroused by language stimuli.] *Psychologica Berolita*, 1970(Oct), Vol. 21(4), 270-278.—As Berlyne has demonstrated, 6 characteristics of visual material arouse exploratory behavior: amount of material, irregularity of distribution, heterogeneity of elements, irregularity of forms, discrepancies, and incompatible composition. These characteristics were transferred to language material which was then used as stimuli in test series of preference selection with 193 male adults, 193 female adults, and 193 7-13 yr. old children as Ss. The responses were factor analyzed. More adults preferred irregular variants than children. Children's selections were mainly determined by 3 factors: believability, difference of elements, and orderliness. For adults only 2 factors carried weight: amount of material and heterogeneity.—W. J. Koppi.

798. Švancara, Josef. (Purkyne U., Brno, Czechoslovakia) **Aktuální problémy vývojové psychologie v teorii a praktické aplikaci.** [Current problems of developmental psychology in theory and practical application.] *Psychológia a Patopsychológia Dieťaťa*, 1970, Vol. 5(3), 195-200.—Outlines the problems and range of developmental psychology. A future trend resulting from the employment of a vertical approach is predicted. Emphasis is placed on the necessity to assimilate information of boundary scientific disciplines—genetics, 1st—and on the inevitability of an integration of partial theoretical conceptions. (Russian summary) (27 ref.)—*English summary.*

799. Thomas, Georgelle & Osgood, W. Shirley. (Georgia Southern Coll.) **College students' performance on the "fruit-tree experiment" under varied conditions of color availability.** *Journal of Psychology*, 1971(Mar), Vol. 77(2), 253-256.—Tested 178 college students on the "fruit-tree experiment" under varied conditions of color availability. Apple trees outranked all other trees in each condition except where orange but no red was available. In this condition, orange trees were most often drawn. It was found that college students depict apple trees significantly more often than do children when all colors and when red, green, and yellow only are available. No significant difference was found in frequency of drawing an apple tree, all colors available, and naming an apple tree in response to the word stimulus, "fruit tree."—*Author abstract.*

INFANCY

800. Caldwell, Henry S. (Purdue U.) **The infant cry.** *Dissertation Abstracts International*, 1970(Oct), Vol. 31(4-B), 2274.

human infants. *Dissertation Abstracts International*, 1970(Nov), Vol. 31(5-B), 2955.

802. Desmedt, John E. & Manil, J. (U. Brussels, Brain Research Unit, Belgium) **Somatosensory evoked potentials of the normal human neonate in REM sleep, in slow wave sleep and in waking.** *Electroencephalography & Clinical Neurophysiology*, 1970(Aug), Vol. 29(2), 113-126.—Investigated averaged cerebral potentials evoked by electrical stimulation of the fingers in 34 full-term normal human newborns. The stimuli were delivered at intervals of at least 3 sec. and generally 5-12 sec. to avoid sequential interactions between responses. They were of adequate intensity to evoke consistent responses both at the contralateral parietal projection and at the vertex, but did not interfere with the normal cycles of slow wave sleep (SWS) and of REM sleep (REMS). Sleep stages were identified by pattern of respiration, eye, face, and limb movements, spontaneous EEG, submental EMG, and also by the histogram of heart beat intervals. The somatosensory evoked potentials presented genuine and consistent features in typical REMS and SWS runs. The mean latency and voltage of the initial surface negative component, N_1 , which is characteristic of the newborn response but is no longer developed in the adult, did not differ significantly in the 2 sleep stages. The latency to the peak and the duration of N_1 were significantly increased in SWS. The positive component P_1 which followed N_1 was recorded in both sleep stages. However, a 2nd component, P_2 , was present only in SWS and provided the most typical feature of that stage. As a result, the total duration of the positive deflection was much longer in SWS than in REMS. Late negative N_2 and positive P_2 components were also influenced by the sleep stages. Interesting correlations appeared between the evoked potentials recorded at the hand projection and at the vertex. In waking the evoked potentials appeared rather similar to those in activated REMS. (French summary) (48 ref.)—*Journal summary*.

803. Ellingson, Robert J. (U. Nebraska, Medical Center, Omaha) **Variability of visual evoked responses in the human newborn.** *Electroencephalography & Clinical Neurophysiology*, 1970(Jul), Vol. 29(1), 10-19.—Summed visual evoked responses (VERs) were recorded repeatedly during the various phases of the wakefulness-sleep cycle on the 1st day of life and again 24 hr. later in 6 full-term human newborns. VERs were analyzed in terms of wave form changes and amplitudes and latencies of the various wave components. 1 S showed an invariant wave form throughout a recording session. Only the P_2 wave component was always present in all Ss, and it was the only component of relatively invariant latency within Ss. Amplitudes of all components were extremely variable. Conclusions are: (a) The VER of the human newborn is extremely variable. (b) Only the latency of the P_2 component is consistent enough to be used to characterize a S, but even it does not correlate with its own value a few wk. later. (c) Unless the factors related to its variability can be specified and controlled, the neonatal VER will be of limited value as a tool in clinical measurement or in other individual applications as compared with VERs recorded in older Ss. The principal exceptions would seem to be total absence, extreme distortion, and marked and persistent asymmetry of responses. (French summary) (26 ref.)—*Journal summary*.

804. Emde, Robert N. & Metcalf, David R. (U. Colorado, Medical School) **An electroencephalo-**

graphic study of behavioral rapid eye movement states in the human newborn. *Journal of Nervous & Mental Disease*, 1970(May), Vol. 150(5), 376-386.—In an EEG-polygraphic study of behavioral states (sleeping, drowsing, sucking, fussing, and crying) in 10 full-term newborns, it was found that they are all associated with stage-REM physiology. Independent behavioral and EEG-polygraphic assessments show high agreement in distinguishing these states as a group from other sleep and nonsleep states. The term "undifferentiated" is applied to drowsy-REM, sucking-REM, fussy-REM, and crying-REM because their behavioral and physiological indices are relatively unpatterned and, from the viewpoint of infant development, these states disappear during the 1st 3 mo. of postnatal life. Neonatal REM sleep is also conceptualized as undifferentiated as it shows an initial high variability of physiological patterning which tends toward stability over the 1st 3 mo. This change is concomitant with another major change: at 3 mo., sleep begins with NREM instead of REM sleep. (17 ref.)—*Journal abstract*.

809. Koch, Jaroslav. (Inst. for the Care of Mother & Child, Prague, Czechoslovakia) **Vliv rané pohybové a sociální stimulace na pohybový a psychický vývoj kojence v prvních 6 měsících života.** [The influence of early motor and social stimulation on motor and mental development in the first six months of an infant's life.] *Psychológia a Patopsychológia Dieťaťa*, 1970, Vol. 5(3), 201-208. Studied the effect of early stimulation on human development. Based upon previous experiences with motor development and retardation in 6-8 mo. old infants, the question was raised as to how motor and mental development proceeds in children who, from the 1st wk of their lives, are stimulated to movement more intensely than those brought up traditionally. Preliminary findings are based on an experiment with 10 infants who were exercised and observed from birth to 6 or 7 mo. of age, and with 20 3-10 mo. old infants who were brought up at home and whose mothers received instructions twice/mo. The most striking result was the good motor development of all the Ss who were physically exercised. (Russian summary)—*English summary*.

810. Melson, William H. & McCall, Robert B. (U. North Carolina) **Attentional responses of five-month girls to discrepant auditory stimuli.** *Child Develop-*

ment, 1970(Dec), Vol. 41(4), 1159-1171. Presented an 8-note standard tonal sequence 8 times to 48 5-mo-old girls. Following this familiarization phase, a series of small or large discrepancies from that standard were presented. Attention in terms of cardiac deceleration to the discrepancies was greater if Ss habituated during the familiarization phase than if they did not, and attention was greater if the discrepancy was large than if it was small in magnitude. The response to auditory stimuli could also be predicted by the looking pattern displayed by Ss to a set of visual stimuli given prior to the auditory episode.—*Journal abstract.*

811. Sameroff, Arnold J. (U. Rochester) **Respiration and sucking as components of the orienting reaction in newborns.** *Psychophysiology*, 1970(Sep), Vol. 7(2), 213-222.—Studied respiratory and nonnutritive sucking responses to auditory stimulation in 12 1-5 day old human newborns. Each S was presented 5 stimuli, each 4 times, during 4 sessions at 24-hr intervals. The stimuli varied in intensity and intermittency. Stimulus onset and offset shortened sucking bursts during Sessions I-III, but in Session IV, stimulus offset lengthened sucking bursts. In general, respiration was accelerated by stimulus onset and decelerated by stimulus offset. However, in Session IV respiratory deceleration occurred to both stimulus onset and offset. Respiratory deceleration also occurred to low intensity stimuli in Sessions I-III. Respiratory acceleration and sucking inhibition are discussed as components of the newborn's defense reaction (DR) to most stimulation. Respiratory deceleration was related to appearance of orienting reaction after habituation of DR. Ss' respiratory and sucking responsivity were highly correlated.—*Journal abstract.*

812. Schwartz, Andrew; Rosenberg, Dana, & Brackhill, Yvonne. (U. Denver) **Analysis of the components of social reinforcement of infant vocalization.** *Psychonomic Science*, 1970(Sep), Vol. 20(6), 323-325. Results of 2 studies with 22 normal, full-term infants indicate that infant vocalizations can be conditioned by using only 1 or 2 elements of the traditionally employed composite social reinforcer, consisting of auditory, tactile, and visual stimuli. It was also found that the components, both singly and in pairs, were of relatively equal effectiveness in increasing response rate. *Journal abstract.*

813. Shultz, Thomas R. & Zigler, Edward. (Yale U.) **Emotional concomitants of visual mastery in infants: The effects of stimulus movement on smiling and vocalizing.** *Journal of Experimental Child Psychology*, 1970(Dec), Vol. 10(3), 390-402. Investigated the view that positive emotional responses accompany the gratification of the motive for cognitive effectiveness. Piaget's concepts of assimilation and accommodation were employed to predict the timing of emotional concomitants of visual mastery in 8-18 wk. old infants. The hypothesis that smiling and vocalizing would occur earlier to a stimulus that was assumed to be relatively easy to assimilate than to a stimulus that was assumed to be more difficult was confirmed. A mechanism of cognitive satiation was invoked to account for decrements in the amount of smiling, vocalizing, and visual fixation of the stimulus from 1 session to the next. (23 ref.)—*Journal abstract.*

814. Turkewitz, Gerald; Moreau, Tina; Birch, Herbert G., & Davis, Linda. (Albert Einstein Coll. of Medicine, Yeshiva U.) **Relationships among responses in the human newborn: The non-association and non-**

equivalence among different indicators of responsiveness. *Psychophysiology*, 1970(Sep), Vol. 7(2), 235-247.—To determine whether different responses are equivalent indicators of stimulus effectiveness and whether a single mechanism can account for responsiveness in different systems, cardiac acceleration, ipsilateral eye movements, and finger movements were simultaneously recorded when lateralized auditory stimuli of graded intensity were presented to 21 healthy female 2-day-old infants. Responses were not equivalent indicators of stimulus effectiveness as evidenced by the finding of different thresholds for different responses. It was also found that S's relative responsiveness as defined by 1 response did not predict his relative responsiveness on other responses. Finally the simultaneously measured responses to a stimulus did not co-occur more frequently than would be expected if the responses were independently determined. Results raise serious questions as to the adequacy of concepts of conditioned arousal and unitary orienting response in accounting for behavior organization in the human newborn. (19 ref.)—*Journal abstract.*

815. Vincze, Mária. **Társas kapcsolatok alakulása egy csecsemő-csoportban 3-16 hónapos korig** [Formation of social contact in a group of infants age 3-16 months.] *Magyar Pszichológiai Szemle*, 1970, Vol. 27(1), 25-30.—7 institutionalized infants were observed while playing in a common playpen. At 2-3 mo. attempts were made to establish contact with the O; from the 3rd mo. touching each other became more frequent, at 7 mo. and on toys became functional in social intercourse. (English & Russian summaries)—*M. Moore.*

German: Die Beurteilung des "sozialen Alters" durch Vorschulkinder: Ein Beitrag zur Analyse der Genese der Rollenwahrnehmung.** [The judgment of the "social age" by infants: A contribution to the analysis of the genesis of the perception of roles.] *Dissertation Abstracts International*, 1970(Nov), Vol. 31(8-B), 2971-2972.

CHILDHOOD

817. Balástiková, Blanka & Švancara, Josef. (Inst. for Pediatrics, Brno, Czechoslovakia) **Předběžná zkoušenost a metodou sémantického diferenciatu školních dětí.** [Preliminary experiences with the semantic differential in school children.] *Psychologická Paedagogická Dieťa*, 1970, Vol. 5(3), 217-226.—Presented 50 words with presumed positive, negative, or reversible emotional coloring to schoolchildren to be rated on a 5-point scale of pleasantness-unpleasantness. The words, written very clearly on small cards, were to be placed by the Ss into 1 of 5 boxes labelled very pleasant, indifferent, unpleasant, and very unpleasant. 2 basic hypotheses, developmental and environmental, were followed in 50 healthy school children (twins), 20 surgical Ss, and 20 of the same age in an orthodontia department. Findings confirm the hypothesis about there being changes in emotional evaluation of words depending on age (changes of word order, significantly more frequent use of the neutral rating category in older Ss, and significantly higher frequency of maximum positive ratings in younger Ss. Different experiences with various medical institutions were found to be statistically significant only in a smaller number of concepts. (Russian summary)—*English summary.*

818. Cairns, Nancy U. & Steward, Margaret S. (Emory U.) **Young children's orientation of letters as a function of axis of symmetry and stimulus alignment.** *Child Development*, 1970(Dec), Vol. 41(4), 993-1002.—Examined the effects of axis of symmetry and relative position of stimuli by means of a letter-orientation task administered to 60 male 4-6 yr. old children. S variables examined were age and eye-hand dominance (mixed vs. unilateral established). Left-right awareness and knowledge of names of stimulus letters were found to correlate with error scores. Significant effects were found for age, axis, axis \times age, axis \times position, and age \times axis \times position. Results are discussed in terms of implications for reading. (31 ref.)—*Journal abstract.*

819. Cairns, Robert B. (Indiana U.) **Meaning and attention as determinants of social reinforcer effectiveness.** *Child Development*, 1970(Dec), Vol. 41(4), 1067-1082.—Conducted 3 experiments with 140 primary-grade children to determine whether the effectiveness of a verbal event ("right") as an outcome could be influenced by experimentally manipulating its signal function. Each experiment had a parallel condition in which a neutral nonverbal event (light-bell combination) was submitted to identical experimental operations. In accord with earlier studies, both "right" and the nonverbal event were found to be ineffective as outcomes when they occurred without a prior instructional set or as discriminative signals. Results were largely consistent with an interpretation of social reinforcer effectiveness which emphasizes the contextual signal properties of these events. Certain implications of the research for the problem of "social satiation" and the nonefficacy of social reinforcement events are discussed. (23 ref.)—*Journal abstract.*

820. Cantor, Gordon N. & Moeller, Thomas G. (U. Iowa, Inst. of Child Behavior & Development) **Negative evidence regarding energization effects of simple, unchanging stimulation.** *Psychonomic Science*, 1970(Sep), Vol. 20(6), 351-353.—46 7th and 8th grade boys viewed picture exposures that alternated with a lever-pulling response. Group SUN (simple, unchanging, nonmeaningful) viewed 12 60-sec presentations of a constant simple geometric form. Group CCM (complex, changing, meaningful) viewed 6 10-sec exposures of nonrepeated meaningful pictures on each of 12 trials. Group SUN responded with nonsignificantly smaller amplitudes, with nonsignificantly longer latencies, and with significantly longer durations. It is concluded that no clear evidence was obtained for energization effects of simple unchanging stimulation. The duration finding was interpreted as indicating that Group SUN Ss were responding so as to provide themselves with additional (kinesthetic) stimulation.—*Journal abstract.*

821. D'Angelo, R., Walsh, J., & Lomangino, L. (Catholic Charities Guidance Inst., New York, N.Y.) **IQs of Negro Head Start children on the Vane Kindergarten Test.** *Journal of Clinical Psychology*, 1971(Jan), vol. 27(1), 82-83.—The Vane Kindergarten Test (VKT) was administered to 255 48-71 mo. old Negro children enrolled in a Head Start program. Negro girls tended to score higher than boys on all measures in the 2 youngest age groups. Other sex and age findings were noted. Use of the VKT with children below the age of 54 mo. is questioned. "Further study is suggested to determine whether absence of expected findings is due to limitations in the Vane's discriminatory value or to general

change in the mode of Negro functioning."—E. J. Kronenberger.

822. Davis, S. Elizabeth. (Temple U.) **Reading disability: Perception and reading.** *Proceedings of the Annual Reading Institute*, 1968(Mar), Vol. 7, 33-37.—The senses most involved in reading are sight and hearing. Unless seriously impaired through prenatal, natal, or postnatal injury, individuals are born with the potential for development of adequate use of all the modalities. Within each modality there are 3 factors which must be working together if the modality is to be strong and well-developed—discrimination, patterning, and memory. As a child grows from infancy, he seems to grow through several levels of perceptual development. These levels are (a) the input-output stage, (b) the level at which the child does make associations and understands what he wants to say, and (c) a level which includes not only understanding and making associations but organization as well. Learning to read is affected by knowledge of and exposure and attention to the symbolic language used in writing.—S. Diamond.

823. Einhorn, Jane. (Newark State Coll.) **A test of Piaget's theory of moral judgment.** *Canadian Journal of Behavioural Science*, 1971(Jan), Vol. 3(1), 102-113.—Tested Piaget's theory that children's moral development is a function of their peer group experiences and age. 48 8-yr-old children, in 16 cohesive and 16 low-cohesive groups of 3, competed for prizes on 4 paper-and-pencil tasks, unaware that their cheating could be detected. The procedure was repeated with 48 5 yr. olds. Prior social experience was inferred from sociometric data. Findings are: (a) 5 yr. olds cheated significantly more than 8 yr. olds, supporting Piaget's belief that moral autonomy increases between ages 5 and 8; (b) at age 8, but not at age 5, cheating was an inverse function of the degree of cohesiveness, supporting Piaget's theory that group ties produce moral autonomy at age 8, but not at age 5; and (c) prior social experience bore a significant inverse relationship to cheating at age 8, but not at age 5, supporting Piaget's theory that such experience is the principal factor responsible for moral autonomy at age 8, but not at age 5. (French summary)—*Journal abstract.*

824. Fast, Irene. (U. Michigan) **A function of action in the early development of identity.** *International Journal of Psycho-Analysis*, 1970, Vol. 51(4), 471-478.—The child's purposeful activity is important in his development of self and identity. Initial self-boundaries are established when pleasurable events are incorporated into the self and painful events are excluded. Imposters—the "as-if" personalities—have identity through impersonations not based on actual accomplishments or purposeful activity. They learn the embellishments not the activity of their new roles. Therapy is difficult where reality cannot be tested as in the case of the "as-if" patients.—J. Chyatte.

825. Glushkova, Ye. **Deti u televizora.** [Children at the television set.] *Doshkol'noe Vospitanie*, 1970(Nov), Vol. 43(11), 66-69.—Describes the possible maleficent effects of the misuse of TV watching on children. Investigations and measurements made by an institute of health in the Soviet Union with 2-9 yr. olds were studied. Factors involved were: (a) the physical capacity of the child at the beginning and at the end of TV watching; (b) maximum watching duration; and (c) proper physical surrounding conditions. It was shown that maximum watching time should be 30 min. for preschoolchildren

and 1 hr. for a lower grade child, and only 2-3 times wk. Proper light, distance from screen, and sitting position must be observed. Private physicians' available reports indicate the appearance of symptoms, e.g., irritability, fatigue, psychic disturbances, and convulsions ("television epilepsy") after 2-3 hr. spent watching TV.—*J. Hulse*.

828. Harbison, J. J. (Queen's U., Belfast, Ireland) The behaviour of normal adolescents on a group form of the Bannister Fransella Test of Thought Disorder. *Papers in Psychology*, 1969(Oct), Vol. 3(2), 52-56.

Administered a group form of the Bannister-Fransella Test of Thought Disorder to 184 normal 11.11-16.11 yr. old Ss. Sex and intelligence were not important determinants of test behavior. Age was an important factor up to 13 yr. Ss over this age show similar results to the standardization sample. Different cutoff points are suggested for the 12-yr-old group.—*Journal abstract*.

829. Hollenberg, Clementina K. (U. California, Berkeley) Functions of visual imagery in the learning and concept formation of children. *Child Development*, 1970(Dec), Vol. 41(4), 1003-1015.—Tested individually 64 elementary school children scoring in the upper and lower quartiles of their grades on tests of visual imagery in an experimental situation simulating the learning of verbal labels. High imagery Ss were significantly superior to low-imagery Ss (matched for sex, age, and IQ) in the initial learning of the names of objects; but low-imagery Ss were significantly superior to high-imagery Ss in grasping the concepts underlying a series of objects with the identical name. The low-imagery group also had a superior recall of objects with a given name, apparently as a function of their superior concept formation. Increasing age obliterated the discrepancy between the 2 imagery groups in concept formation but not in name learning. (17 ref.)—*Journal abstract*.

830. Insel, Paul & Wilson, Glenn D. (Inst. of Psychiatry, London, England) Measuring social attitudes in children. *British Journal of Social & Clinical Psychology*, 1971(Feb), Vol. 10(1), 84-86.—Describes the 50-item Children's Conservatism (C) Scale, modeled after the Wilson and Patterson C Scale. The Children's C Scale was administered, along with the original scale, to 185 12-16 yr. old girls (100 from a Catholic convent school and 85 from a state school) in the same area. Hypotheses that (a) the 2 scales should be highly correlated, and (b) both should display internal consistency and the ability to discriminate between the schools are supported. Results indicate the promise of a scale modeled on the original C Scale for measuring social attitudes in children.—*P. Hertzberg*.

831. Ireton, Harold; Thwing, Edward, & Gravem, Howard. (U. Minnesota, Health Sciences Center) Infant mental development and neurological status, family socioeconomic status, and intelligence at age four. *Child Development*, 1970(Dec), Vol. 41(4), 937-945.—Explored the relationship of infant mental development (Bayley Mental Scale, 8 mo.) to 4-yr Stanford-

Binet, L-M, Short Form IQ in the context of the study sample's neurological and socioeconomic characteristics for a sample of 536 full-term children. The sample was approximately normal or average in terms of infant mental scores, infant neurological status, socioeconomic status (SES), and 4-yr IQ. The SES showed the highest relationship to 4-yr IQ but infant mental score also showed meaningful correlation with 4-yr IQ. The SES showed no correlation with infant mental scores. Categorical analysis showed that low mental score was a better predictor of low 4-yr IQ ($IQ < 85$) than was low SES. High SES was a better predictor of high 4-yr IQ ($IQ > 115$) than was high mental score.—*Journal abstract*.

833. Keasey, Charles B. (U. California, Berkeley) The modification of moral opinions and reasoning in preadolescents. *Dissertation Abstracts International*, 1970(Oct), Vol. 31(4-B), 2257-2258.

834. Királyné-Déval, Margit. (Hungarian Academy of Sciences, Psychological Inst., Budapest) A társadalmi környezet szerepe a 3-6 évesek verbális erkölcsi ítéleteinek kialakulásában és fejlődésében. [The role of social environment in the formation and evolution of verbal moral judgments at 3-6 years of age.] *Magyar Pszichológiai Szemle*, 1970, Vol. 27(1), 43-57.—10 empirical categories of moral conduct were established. Family and nursery-school influence on moral development was found to increase with age. (English & Russian summaries)—*M. Moore*.

835. Kirkendall, Don R. & Ismail, A. H. (U. Kentucky) The ability of personality variables in discriminating among three intellectual groups of preadolescent boys and girls. *Child Development*, 1970(Dec), Vol. 41(4), 1113-1118.—Studied 205 10-12 yr. old children to evaluate the ability of personality variables, as measured by the Children's Personality Questionnaire (Form A) to discriminate among three intellectual groups of preadolescent children, to determine (a) the relative importance of these variables in the discrimination, and (b) the ability of the personality variables in classifying Ss into intellectual groups. In addition, some discussion of the multivariate approach used (discriminant-function analysis) is provided. It is concluded that children of different intellectual levels differ in their personalities, and that children with high intellectual ability tend to be more emotionally well-adjusted.—*Journal abstract*.

836. Kunz, Jean & Moyer, Joan E. (Scripps Coll.) A comparison of economically disadvantaged and economically advantaged kindergarten children. *Journal of Educational Research*, 1969(May), Vol. 62(3), 392-395.—Conducted 2 studies concurrently to determine whether there are significant differences in selected characteristics between 25 economically disadvantaged and 18 economically advantaged 5 yr. olds. The areas investigated included physical, social, and language skills, intelligence, emotional disturbance, creativity in the use of materials, curiosity, attention to and interest in stories, preference for rewards, sensory discrimination ability, problem solving ability, and ability to conserve. 1 null hypothesis was supported, 3 null hypotheses were not supported, and 3 null hypotheses were partially supported.—*Journal abstract*.

837. Lee, Lee C. (Cornell U.) The concomitant

development of cognitive and moral modes of thought: A test of selected deductions from Piaget's theory. *Genetic Psychology Monographs*, 1971(Feb), Vol. 83(1), 93-146.—195 boys, equally represented at 5-17 yr. of age, were given a series of 6 Piagetian cognitive tasks. Each boy's performance on these cognitive tasks was used to predict his response to 9 different morally conflicting story situations. Children's cognitive and moral development (with social class, sibling position, and IQ held constant) was hypothesized to progress sequentially, and concomitantly (a) from a beginning period of preoperational thought where moral judgments are based mainly on an authority oriented approach, (b) to the next stage of concrete operational thought where cooperation and reciprocity are used as a base for moral judgments, and (c) finally to the formal operational stage of thought where moral judgments involve idealistic ideological orientation. The findings support Piaget's thesis of concomitant "growth" of the 2 modes of thought. (41 ref.)—*Author abstract*.

838. Lurçat, Liliane. (National Center of Scientific Research, Paris, France) **La reproduction du dessin du cube chez le jeune enfant.** [The reproduction of a cube design by young children.] *Bulletin de Psychologie*, 1969/1970, Vol. 23(4-5), 239-253. Preschool children and those in the 1st primary grades were tested for their capability to reproduce a 3-faced cube juxtaposed and a 6-faced cube superimposed. Preschoolers showed various developmental stages. The easiest task for them was a simple quadrilateral. Difficulties appeared in juxtaposition and superimposition of orthogonal polygons. Obliqueness presented an additional difficulty. Archaic reproduction forms disappeared between the 1st and 3rd grades when parallels and obliques could be reproduced. Various developmental approaches for successful reproduction are discussed.—*R. E. Smith*.

839. Morin, Robert E., Hoving, Kenneth L., & Konick, Dorothy S. (Kent State U.) **Are these two stimuli from the same set? Response times of children and adults with familiar and arbitrary sets.** *Journal of Experimental Child Psychology*, 1970(Dec), Vol. 10(3), 308-318.—Describes an experiment in which 20 4th grade children and adults decided whether 2 stimuli were from the same or different sets. RT data suggest that the Ss used an encoding strategy if the sets had familiar names and a search strategy if the sets were arbitrarily grouped elements. 20 kindergarten Ss showed some signs of encoding, but also exhibited behavior suggestive of deficiencies in mediation and rehearsal, and a dependence on visual cues.—*Journal abstract*.

840. Muralidharan, Rajalakshmi. (National Inst. of Education, New Delhi, India) **Developmental norms of children aged 2½-5 years: A pilot study.** *Indian Educational Review*, 1969(Jan), Vol. 4(1), 67-91.—Studied a sample of 38 2½-5 yr. old children drawn from 10 nursery schools of New Delhi, to trace the pattern of child development during these yr. Other objects were (a) to develop, modify, and adapt to Indian condition the testing equipment in Gesell's Developmental Schedule in the fields of motor, adaptive, language, and personal-social development; (b) to develop observational record blanks for all the tests included in this study; and (c) to develop standard procedures for administering the different tests. How the above objectives were pursued is described.—*Journal abstract*.

841. Ricciuti, Henry N. (Cornell U.) **Malnutrition, learning, and intellectual development: Research**

and remediation. In F. F. Korten, S. W. Cook, & J. I. Lacey (Eds.), "Psychology and the problems of society" (See PA, Vol. 46:Issue 1) 237-253.

842. Samuels, S. Jay. (U. Minnesota) **Recognition of flashed words by children.** *Child Development*, 1970(Dec), Vol. 41(4), 1089-1094.—Investigated the effect of associative connections between words on speed of word recognition. The hypotheses were: recognition speed would be faster when an anticipated word was presented; recognition would be faster when the target word was preceded by an associate; and recognition would be slower when the target word was preceded by a nonassociate. 20 4th graders recognized words under 5 treatment conditions in a counterbalanced design. Data support the hypotheses. Results indicate many similarities between adults and children in word recognition. However, 2 important differences were found. Ss responded more quickly than adults when anticipated target words were presented in isolation, and less quickly than adults when nonanticipated associatively connected words were shown. These differences suggest somewhat different strategies in word recognition. Explanations of these differences are discussed.—*Journal abstract*.

845. Williams, Phillip; Davies, Pat; Evans, Roy, & Ferguson, Neil. (Open U., Bletchley, England) **Season of birth and cognitive development.** *Nature*, 1970(Dec), Vol. 228(5276), 1033-1036.—Discusses the evidence concerning a relationship between level of intelligence and month of birth, which suggests a greater incidence of handicapped children among the summer born. A study of British school children showed "no evidence of a 'season of birth' effect among 5-yr-old children entering the British school system." It is suggested that "the 'season of birth' effect in handicapped children is likely to be a product of the educational system itself." Ways of modifying the school system to reduce the incidence of handicapped children among the summer born are considered. (22 ref.)—*S. Appelle*.

Learning

846. Bradshaw, Jo A. (U. Oklahoma) **Situational variables in verbal conditioning with children using a paired-associate paradigm.** *Dissertation Abstracts International*, 1970(Nov), Vol. 3(5-B), 2952.

847. Brown, Ann L., & Lloyd, Barbara B. (U. Illinois) **Criteria of success in a developmental study of oddity learning.** *British Journal of Psychology*, 1971(Feb), Vol. 62(1), 21-26.—Tested 80 3-7 yr. old boys and girls in 5 equal groups of restricted CA and IQ on a standard 3-position planimetric oddity problem. The relationship of CA and oddity learning was examined for instrumental and verbal criteria. 4 experimental conditions assessing the effects of form (both geometric and life-like) and color as the vehicle dimension for oddity were employed. The instrumental criterion was 1st met by a majority of Ss in the 5-yr-old group. Majority achievement of the verbal criterion 1st occurred in the 6-yr-old group. Verbal justification shifted from "same" to "difference" explanations with age. Initial training on

either form stimuli set led to greater success than initial color training.—*Journal abstract.*

848. Bryant, P. E. (U. Oxford, England) **Discrimination learning and the study of transfer in young children.** *British Journal of Psychology*, 1971(Feb), Vol. 62(1), 1-11.—Investigated the possibility that what has been described as dimensional transfer may be transfer of a response to a specific location within the visual display in discrimination learning experiments. In Exp. I, with 40 5-yr-old children. Ss were able to transfer on the basis of the location of the relevant cues within the visual display. In Exp. II, with 160 5-7 yr. old children, the strengths of dimensional and locational transfer were directly compared. 5-yr-old Ss showed stronger locational than dimensional transfer, while 7-yr-old Ss showed only dimensional transfer. Implications for the use of discrimination learning techniques, the study of perceptual development, and the study of pattern recognition are discussed. (17 ref.)—*Journal abstract.*

849. Cantor, Joan H. (U. Iowa, Inst. of Child Behavior & Development) **Facilitating and interfering effects of stimulus naming on children's motor paired-associate learning.** *Journal of Experimental Child Psychology*, 1970(Dec), Vol. 10(3), 374-389.—Investigated the effects of stimulus naming on the concurrent acquisition of motor responses to the stimuli. In Exp. I, with 120 8th and 9th graders, similar names were either familiar or unfamiliar; in Exp. II, with 172 12-14 yr. old Ss, names were either dissimilar and familiar, or similar and unfamiliar. In both experiments, conditional probabilities provided strong evidence that verbal and motor responses are learned in pairs, with resultant facilitating and interfering effects on motor performance. These effects were attributed to the development of name-button associations that tended to produce mediated correct responses and errors. Comparison of naming conditions suggested that name-button associations develop faster when the names are familiar and dissimilar. Results are also discussed in terms of their implications for an alternative interpretation of stimulus pretraining effects in more traditional transfer experiments.—*Journal abstract.*

850. Collins, W. Andrew. (Stanford U.) **Learning of media content: A developmental study.** *Child Development*, 1970(Dec), Vol. 41(4), 1133-1142.—Tested 168 3rd, 6th, 7th, and 9th grade middleclass children for learning of essential and nonessential content from a media presentation for which they received no instructions to learn. It was expected that, even when Ss were unaware they would be tested on the media content, they would consider some information relatively more important than other information. Predictions were based on a hypothesized increase in learning ability with age and the ability of adolescents to attend selectively to information inputs. Results show that learning of essential content increased as a linear function of age. Nonessential content was found to be a curvilinear function of age. A post hoc analysis using a score based on Ss' evaluations of the film (i.e., whether it was entertaining, whether they were similar to characters or to their roles, aspired social class, etc.) showed that Ss who gave the film a high evaluation learned more nonessential content than Ss who gave the film a low evaluation. (16 ref.)—*Journal abstract.*

851. Croll, William L., Knauss, Mary J., & Duke, Ann W. (U. Iowa) **Sequential contiguity and short-term memory in children's discrimination learning.** *Journal of Experimental Child Psychology*, 1970(Dec), Vol. 10(3), 337-343.—Describes 2 experiments in which preschoolchildren's performance on a successive discrimination was an increasing function of sequential contiguity (the probability that presentation of a given stimulus is followed by another presentation of that same stimulus rather than by presentation of a different stimulus). An explanation of this sequential contiguity effect is supported in terms of short-term memory processes.—*Journal abstract.*

852. Deichmann, John W. (St. Louis U.) **Developmental trends in the effects of item pronunciation on verbal discrimination learning and associative recall.** *Dissertation Abstracts International*, 1970(Nov), Vol. 31(5-B), 2957.

853. Dick, Stuart & Landau, Jeffrey S. (Adelphi U.) **Attribute learning in preschoolchildren: Mediation and selection mechanisms.** *Psychonomic Science*, 1970(Oct), Vol. 21(2), 105-107.—Taught 30 3.5-4.5 yr old children to respond to a black vertical line (S+) and tested for orientation, form, and color generalization under 2 test procedures. Results indicate that (a) procedure which approximated successive generalization testing (N) provided little evidence that any of the tested-for attributes were learned, whereas a procedure which contained dimensional "orienting" properties (O) indicated that each tested-for S+ attribute was learned, and (b) group analyses of the O procedure suggested a hierarchical arrangement of learned attributes. However, additional analyses failed to reveal hierarchies for individual Ss. Results suggest that during training the S+ complex activates for different individuals either 2, or 3 attribute mediators and that during testing properties of the test operate to select activated mediators to control test behavior.—*Journal abstract.*

854. Dornbush, Rhea L. & Basow, Susan. (New York Medical Coll.) **The relationship between auditory and visual short-term memory and reading achievement.** *Child Development*, 1970(Dec), Vol. 41(4), 1033-1044.—Presented bisensory memory spans, in which rate of presentation, modality of presentation, and order of report were varied, to 72 1st, 3rd, 5th, and 9th grade Ss. Intelligence was held constant; Ss in each grade were subdivided according to reading ability—good and poor—as measured by the Gates-MacGinitie Reading Test. It was found that performance on memory tasks was not affected by reading level and that young Ss do not operate in terms of storage; they ignore what they cannot immediately handle. (24 ref.)—*Journal abstract.*

855. Goulet, L. R. & Williams, Kerry G. (U. Illinois) **Children's shift performance in the absence of dimensionality and a learned representational response.** *Journal of Experimental Child Psychology*, 1970(Dec), Vol. 10(3), 287-294.—Compared the transfer performance of 6- and 8-yr-old children on reversal (R) and $\frac{1}{2}$ -reversal (HR) shifts under treatments where the same or a new set of responses were used on the shift lists. Performance on the R shift was superior to that on the HR shift only for treatments where the responses were identical (I) on the 2 lists. Additional comparisons with performance under a control treatment (involving new stimuli and responses on Lists 1 and 2) indicate strong positive transfer on the R-I treatment and negative transfer on the R-C treatment (where the responses were changed on Lists 1 and 2). The pattern of results was functionally identical for both groups of Ss. The performance on the R-I treatment was attributable to Ss

use of a nonmediational "response-switching" strategy.—*Journal abstract.*

857. Locke, John L. & Fehr, Fred S. (U. Illinois, Champaign) **Young children's use of the speech code in a recall task.** *Journal of Experimental Child Psychology*, 1970(Dec), Vol. 10(3), 367-373.—EMG and sound recordings were taken from 12 4- and 5-yr-old males and females during a recall task in which they saw pictures whose names contained or did not contain labial phonemes. Subvocalization, suggested primarily by labial-nonlabial tracing discrepancies, occurred during picture presentation but not during a subsequent rehearsal period which preceded Ss' oral recall. The relevance of these findings to mediational- and production-deficiency hypotheses in young children, the implications of implicit speech for short-term memory coding, and the use of EMG as a technique in the study of verbal mediation, are discussed. (18 ref.)—*Journal abstract.*

868. Dale, L. G. (Australian Council for Educational Research, Hawthorn, Victoria, Australia) **The growth of systematic thinking: Replication and analysis of Piaget's first chemical experiment.** *Australian Journal of Psychology*, 1970(Dec), Vol. 22(3), 277-286. Replicated B. Inhelder and Piaget's 1st chemical experiment and analyzed the structure of the problem, using 200 6-16 yr. old children. When responses to questions were listed and the frequency of each response for each age group was calculated, a significant difference was found between the sexes. Combinatorial thinking was found to develop linearly from 6-16 yr. Findings reveal many differences from those described by Inhelder and Piaget. Implications for those who wish to apply Piaget's findings to children generally and for those who would use success in solving the 1st chemical problem as a criterion for the attainment of formal thinking are discussed.—*Journal abstract.*

869. Davine, M., Tucker, G. R., & Lambert, W. E. (Queen's U., Kingston, Ontario, Canada) **The perception of phoneme sequences by monolingual and bilingual elementary school children.** *Canadian Journal of Behavioural Sciences*, 1971(Jan), Vol. 3(1), 72-76.—Compared 121 3rd and 4th grade students, some schooled monolingually in either French or English, and some schooled bilingually in both English and French, for their ability to differentially discriminate initial phoneme sequences. This ability was tested with an ABCX discrimination procedure. A significant interaction between method of instruction and category of stimulus sound indicates that the bilingually taught Ss had developed a sensitivity for the sound system of their 2nd language, but that this training had not resulted in a generalized facility in discriminating sound systems by the 4th grade. (French summary)—*Journal abstract.*

870. Elmas, Peter D. (Brown U.) **Effects of memory aids on hypothesis behavior and focusing in young children and adults.** *Journal of Experimental Child Psychology*, 1970(Dec), Vol. 10(3), 319-336.—In Exp. I, 128 2nd graders in 5 groups were administered a series of blank-trials problems under the following testing conditions: (a) with standard procedures, (b) with a reduced set of potentially correct hypotheses (Hs), (c) with a memory aid, (d) with memory plus recoding aids, and (e) with memory and recoding aids in addition to having the Ss' attention closely directed to the potentially positive Hs. In Exp. II, 80 undergraduates in 4 groups were given a similar series of blank-trials problems with 16 rather than 8 potentially correct Hs. Condition b was omitted. In both experiments, all groups reliably used H-defining response sequences on the blank trials. Also, the focusing functions for all groups receiving training aids closely approximated an ideal focusing function and were reliably different from the functions for the groups

Concepts & Language

865. Auerbach, Judith A. (Purdue U.) **Verbalization**

trained under standard conditions. The improvements in focusing were closely matched by higher levels of performance on the component process of coding, recording, and retention of remote outcome information, supporting the assumption that a complex process, e.g., focusing, can be analyzed into measurable components. It is further concluded that deficiencies in focusing may be a function of the unavailability of the relevant information rather than an absence of the necessary rules, as has often been assumed with young children. —*Journal abstract.*

871. Gorelov, I. O nekotorykh osobennostyakh rechi i myshleniya mladshikh doshkol'nikov. [On some of the specific features of speech and thinking in young preschoolchildren.] *Doshkol'noe Vospitaniye*, 1970(May), Vol. 43(5), 34-37.—Reports results of an analysis of 100 words actively utilized by 20 kindergarten children indicating (a) the existence of a serious divergence between the speech and thinking capabilities of young preschoolchildren, and (b) the importance of a qualitative study of their vocabulary, in order to enhance the effectiveness of the rearing process. While speech plays a great role in the development of the child, the identification of speech with thinking should be avoided along with too simplified an understanding of the connections between them.—*I. 872. Greer, G. Brian. (Queen's U., Belfast, Ireland) A preliminary investigation of the learning of the mathematical concepts of set union and intersection by primary school children. *Papers in Psychology*, 1969(Oct), Vol. 3(2), 63-65.—Conducted 2 experiments and a pilot study with 7-14 yr. old boys. Exp. I involved the learning of union and intersection by inductive theory. Instances were predetermined by the E and the tests given as group tests. Exp. II used concrete apparatus manipulated by the S, and tests were presented individually as chosen by the Ss. Results were (a) Ss as young as 8 yr. old could learn both rules by induction, (b) the union rule was generally easier than the intersection rule, (c) Ss were able to perform generalization from color to numbers, (d) learning curves followed predictable patterns, (e) Ss in Exp. II were able to infer the logical structure of the apparatus and express it in general terms, and (f) some form of guided discovery seems to be more effective than pure discovery. It is concluded that the results support the "belief that children of this age can learn quite sophisticated Mathematics if it is presented in an appropriate way."—*S. Knapp.*

874. Houston, Susan H. (Northwestern U.) A re-examination of some assumptions about the language of the disadvantaged child. *Child Development*, 1970(Dec), Vol. 41(4), 947-963.—Although research on the language of the disadvantaged child is now receiving much impetus, few extant studies have been helpful to the teacher. A body of misconception and mythology has developed, centering around the notion of linguistic deprivation, and from this incorrect concept no useful correction programs can stem. Widely held misconceptions about disadvantaged-child language are reexamined in the light of modern linguistic and psycholinguistic advances, including ideas that (a) the language of the disadvantaged child is deficient, does not provide

him with an adequate basis for abstract thinking, and should not be changed since it represents his culture; (b) the disadvantaged child does not use words properly; and (c) to the disadvantaged child, language is dispensable, since such children tend to communicate non-verbally in preference to verbally. (39 ref.)—*Journal abstract.*

875. Jennings, J. Richard. (Walter Reed Army Inst. of Research, Washington, D.C.) The effect of verbal and pictorial presentation on class-inclusion competence and performance. *Psychonomic Science*, 1970(Sep), Vol. 20(6), 357-358.—J. F. Wohlwill (see PA, Vol. 42:13496) reported that young children correctly answer more class-inclusion questions when these items are presented entirely verbally as compared to when verbal presentation is supplemented by pictures. Wohlwill interpreted these results as showing that perceptual factors influence the ability to apply class-inclusion operations. Wohlwill, however, did not explore adequately the cognitive basis of the children's answers. In the present study of 78 kindergarten to 3rd grade boys, cognitively justified class-inclusion answers were facilitated by pictorial rather than verbal presentation, particularly among older boys. Verbal items produced some facilitation in kindergarten boys, but only for unjustified correct answers.—*Journal abstract.*

876. Kress, Roy A. (Temple U.) Reading disability: Cognitive factors. *Proceedings of the Annual Reading Institute*, 1968(Mar), Vol. 7, 47-52.—Asserts that it is the way a child is able to process the raw materials for learning that determines the degree of ability or disability in reading which he develops. The child 1st learns to discriminate the various stimuli, sort out those which are relevant to his activity of the moment, and focus his attention on them. Once having achieved this focus, he is ready to begin the 2nd stage of his activity in moving from the presence of stimulation to cognitive manipulation of the results of the stimulation. During the early stages of his life, the child is going through this sort of process with mainly nonlanguage stimuli. As his cognitive structures and his physical abilities develop, he begins to join the language world as an expressor instead of being merely a receptor. Factors interfering in the word perception facet of reading are discussed.—*S. Diamond.*

877. Larsen, Gary Y. & Flavell, John H. (U. Minnesota) Verbal factors in compensation performance and the relation between conservation and compensation. *Child Development*, 1970(Dec), Vol. 41(4), 965-977. Tested 80 kindergarten and 32 2nd grade children for their understanding of (a) compensation of height-width relations (anticipation of water level in a container), under 3 methods of verbal presentation and for containers both wider and narrower than the standard; (b) compensation of length displacements; and (c) conservation of length. Anticipation of levels for wider containers proved to be the more difficult (and probably the more valid) test of compensation skill, and a less abstract method of presentation significantly facilitated compensation performance only when Ss' anticipations bore on these containers. Results do not provide clear evidence that compensation is a developmental mediator of conservation in the case of length.—*Journal abstract.*

878. Modigliani, Vito. (Wesleyan U.) On the conservation of simple concepts: Generality of the affirmation rule. *Journal of Experimental Psychology*,

1971(Feb), Vol. 87(2), 234-240.—Tested the generality of the affirmation rule as a function of transformations (T), boundedness (B), and age (A) with 32 Ss including undergraduates and children in each of the age groups —6-7, 8-9, and 11-12. Transformations produced test stimuli by substituting, adding, or deleting values from training stimuli. Bounded, but not unbounded, stimuli could be considered as overall integrated meaningful units. Concept conservation occurred if a test stimulus containing the defining value was classified as an instance of the concept. It was found the T, B, as well as the $T \times B$ and $T \times A$ interactions were significant at the .001 level. It is concluded that contrary to the usual meaning of the affirmation rule, the presence of the defining value is necessary but not sufficient for a stimulus to be identified as an instance of the concept. The boundedness effect is attributed mainly to a coding process. The single age effect accounting for the $T \times A$ interaction is attributed to sampling fluctuations.—*Journal abstract.*

881. Neimark, Edith D. (Douglass Coll., Rutgers State U.) **Development of comprehension of logical connectives: Understanding of "or."** *Psychonomic Science*, 1970(Nov), Vol. 21(4), 217-219.—Administered a 16-item test for comprehension of set inclusion and exclusion, set intersect, and set union to 162 high school students in Grades 9-12 to assess the development of comprehension of "or" in this age range. Following completion of the 1st test, an alternate form was administered to provide additional information on sources of error in dealing with set union. Analysis of number of correct responses revealed that comprehension of "or" develops during the high school age range. Analysis of errors on set union questions suggests that (a) dealing correctly with set union requires formal operations, and (b) most errors result from inadequate applications of concrete operations.—*Journal abstract.*

884. Sebastian, Lois P. (Temple U.) **Language learning: The cognitive domain.** *Proceedings of the Annual Reading Institute*, 1968(Mar), Vol. 7, 39-46.—Meaning is not inherent in the word or organism, but learned as a result of personal experiences. In all the theories of language learning there is the commonality of the same formula—experience and behaving. Piaget's theory of cognitive development is reviewed and applied

to language learning. There is a sequence to learning meaning. Disregarding this, there has been too much emphasis on reading too early. Teachers do too much telling and not enough facilitating. Intelligence can be developed through interaction with the environment, and language must be viewed as a facilitator of intellectual development and thought. Educators must have the patience to permit a child to develop an adequate foundation for the subsequent complex tasks he faces in the areas of reading and thinking.—*S. Diamond.*

885. Sjöberg, Lennart; Höijer, Birgitta, & Olsson, Ingegerd. (U. Uppsala, Sweden) **Teaching conservation of weight by means of verbal instructions.** *Scandinavian Journal of Psychology*, 1970, Vol. 11(4), 266-273.—Assigned 49 boys and 49 girls, aged 5.6-6.8 yr., to 1 of 4 experimental groups. 3 groups were given verbal instructions as to the invariance of weight in spite of transformations of shape. Instructions were phrased according to the principles of reversibility, decentering, and addition-subtraction, respectively. A 4th group received no verbal information but only external reinforcement. Verbally instructed groups were superior to control and nonverbal groups on a posttest. On transfer and counter-suggestion items the addition-subtraction group had a tendency towards superior performance. (31 ref.)—*Journal abstract.*

887. Young, Maureen M. (Queen's U., Belfast, Ireland) **Children's ability to define words as a function of (a) intelligence and (b) social class.** *Papers in Psychology*, 1969(Oct), Vol. 3(2), 71-72.—Matched 30 middle-class children in P6 classes in 3 schools with 30 working-class children for sex and intelligence. On a task requiring Ss to give as many meanings as possible for each of 30 words (10 had 1 meaning, 15 2, and 5 had 3 meanings), it was found that intelligence level, as measured by the Primary Mental Abilities Test, was a much more important factor than social class.—*S. L. Warren.*

Abilities

888. Arnold, Richard D. & Wist, Anne H. (Purdue U.) **Auditory discrimination abilities of disadvantaged Anglo- and Mexican-American children.** *Elementary School Journal*, 1970(Mar), Vol. 70(6), 295-299.—Developed an auditory discrimination test with a Mexican-American scale of 20 items, an Anglo-American scale of 10 items, and a control scale of 10 items. All items were presented in word pairs requiring aural discrimination of 1st, middle, or last position. 90 disadvantaged 6-9 yr. old Anglo-Americans and 93 Mexican-Americans were selected and assigned to 3 age groups. Results of the test indicate that Anglo-American Ss scored significantly ($p < .01$) better than the Mexican-Americans. The only nonsignificant result was between the youngest Ss on the Anglo-American scale. Implications for education of disadvantaged Mexican-Americans are discussed.—*S. Knapp.*

889. Dewing, K. (U. Western Australia, Nedlands) **Some correlates of creativity test performance in seventh grade children.** *Australian Journal of Psychology*, 1970(Dec), Vol. 22(3), 269-276.—Correlated scores on selected tests of divergent thinking ("creativity"), intelligence, academic achievement, and socio-

economic status in 394 Grade 7 West Australian children from 10 metropolitan schools. The relationship with intelligence was small, positive and significant, and greater for verbal than nonverbal creativity. In most schools the relationship with academic achievement was almost 0. A significant negative correlation was found between creativity and popularity in 3 schools; correlations were not significant in the other 7. There was a highly significant relationship between mean creativity scores for each school and rated socioeconomic level of the district. (28 ref.)—*Journal abstract.*

Perception

894. Becker, John T. (John Carroll U.) **Spatial orientation and visual discrimination.** *Perceptual & Motor Skills*, 1970(Dec), Vol. 31(3), 943-946.—Administered an experimental Visual Discrimination Test of Words to 2 groups of 32 kindergartners, matched for CA, IQ, and sex. 1 group was identified as having visual perceptual problems in spatial orientation on the Bender Visual Motor Gestalt Test for children; the other group displayed adequate spatial orientation on the Bender. Data indicate that the experimental task discriminated between Ss with adequate spatial orientation and Ss with poor spatial orientation on the Bender. Ss with developmental lag or deficits in spatial orientation tended to do poorly on both the word-related and non-word-related tasks.—*Journal abstract.*

895. Becker, John T. & Sabatino, David A. (John Carroll U.) **Reliability of individual tests of perception administered utilizing group techniques.** *Journal of Clinical Psychology*, 1971(Jan), Vol. 27(1), 86-88.—4 individual tests of visual and auditory perception and auditory-visual perceptual integration were administered to 169 kindergarten and primary grade children to investigate the reliability of the instruments when administered by group testing techniques. Results indicate that the tests could be administered through group administration techniques with a substantial savings in administration and scoring time. It is suggested that group screening programs could provide reliable and systematic perceptual-motor behavioral data as early as the 1st grade.—*E. J. Kronenberger.*

896. Costa Molinari, José M. & Corominas Busqueta, José. (U. Barcelona, Spain) **Teoría de la información y percepción taquistoscópica.** [Theory of tachistoscopic information and perception.] *Anuario de Psicología*, 1969, Vol. 1, 137-144.—100 14-16 yr. old children were tachistoscopically tested with 10 series of diapositives (in the out-of-context form of numbers, letters and numbers, and geometric figures), presented at a constant velocity of 1/250 sec. It was found that (a) letters had high recognition rates; (b) when letters and numbers were randomly shown, correct responses favored the numbers; (c) the more complicated the test material became, the more indecision increased; (d) when each number contained the same amount of information, the set was recognized in approximately the same proportion; (e) Ss would better recognize materials situated on the left due to previous test experience; and (f) certain geometric figures (e.g., the cross and the circle) elicited higher recognition rates than others. Results are discussed in relation to information theory.—*P. Hertzberg.*

897. Crowder, Aletha M. & Hohle, Raymond H. (U. Iowa, Inst. of Child Behavior & Development) **Time estimation by young children with and without informational feedback.** *Journal of Experimental Child Psychology*, 1970(Dec), Vol. 10(3), 295-307.—Investigated accuracy of time estimation by 112 preschool and elementary schoolchildren, using a reproduction method in which Ss attempted to reproduce the time required for a hidden toy to travel along a path to a designated point. In Exp. I, 1/2 the Ss were given feedback information after each reproduction trial, providing both the direction and magnitude of error, whereas a 2nd group simply made reproductions of the time interval after each presentation of the standard interval. All age groups in both feedback and no-feedback conditions showed initial tendencies to underestimate the standard, but all groups except the preschool Ss in the no-feedback condition showed increasingly accurate estimations over trials. Average relative estimation errors on the last trial block (Trials 13-15) were 5 and 1% of the standard for the preschool and elementary-school Ss in the feedback conditions, and 34 and 1% for these age groups in the no-feedback condition. Results of Exp. II, carried out with preschool Ss only, indicate that these Ss were unable to learn accurate time estimations without informational feedback between test trials; motivating praise in the absence of error-correcting information resulted in decreasing accuracy over trials.—*Journal abstract.*

898. Gaines, Rosslyn. (U. California, Berkeley) **Children's selective attention to stimuli: Stage or set?** *Child Development*, 1970(Dec), Vol. 41(4), 979-991.—Measured the reliability of young children's selective attention to color and form dimensions among 2 S types: 158 color and form selector Ss were assigned either to experimental training (on a dimension different than their dominant selection), to same training on their dominant choice dimension, or a no-training control group. Trained Ss had either hard or easy discrimination training over a 5-wk period. Results indicate significant changes in selective attention among both color and form selectors given hard training and among color selectors given easy training. Form selectors given easy training showed change trends in the appropriate direction. Control color and form Ss showed no significant changes in selection. Results show selective attention to color or form can be experimentally changed

and is not developmentally determined for all Ss. Other sources of attention to color and form dimensions are discussed. (29 ref.)—*Journal abstract.*

899. Girgus, Joan S. & Hochberg, Julian. (City Coll., City U. New York) **Age differences in sequential form recognition.** *Psychonomic Science*, 1970(Nov), Vol. 21(4), 211-212.—Prepared 3 stimuli, an outline square, cross, and block E for whole and sequential form presentation. 12 3-10 yr. old children viewed each stimulus under the 2 presentation schemes and identified the shapes by reference to a confusion matrix. All Ss demonstrated 100% accuracy under the whole form presentation. Significant differences were found in the sequential presentation with the older children showing much better recognition. Recognition errors among the 3 stimuli were only marginally significant.—S. Knapp.

900. Hermelin, B. M. & O'Connor, N. (Medical Research Council, Developmental Psychology Unit, London, England) **Children's judgements of duration.** *British Journal of Psychology*, 1971(Feb), Vol. 62(1), 13-20.—Investigated the ability of 120 5-yr-old children to distinguish a short from a long duration signal. Findings indicate that: (a) though Ss do not tend to orientate spontaneously towards a temporal stimulus dimension, such orientation increases with specific instructions; (b) the difference between the ability to make nontemporal as compared with temporal judgments is more marked when visual than when auditory stimuli are given; and (c) duration of lights and sounds is judged more efficiently when the stimuli are presented simultaneously rather than successively. This is in contrast to the results from nontemporal judgments, particularly where tones are concerned. Pitch discrimination is easiest when the 2 tones to be discriminated are heard 1 after the other.—*Journal abstract.*

901. Horka, Susan T. & Farrow, Bobby J. (U. Notre Dame) **A methodological note on intersubject communication as a contaminating factor in psychological experiments.** *Journal of Experimental Child Psychology*, 1970(Dec), Vol. 10(3), 363-366.—Investigated "the confounding effects that may stem from communication among Ss employed in the same research project." 95 5th and 6th graders were given a test involving the identification of embedded figures in a perception task. $\frac{1}{2}$ of the Ss were tested in the morning and $\frac{1}{2}$ in the afternoon. Results show that although morning Ss were asked not to repeat what had happened in the experiment, both partial and complete communication between the 2 groups was evidenced by the response patterns of the afternoon Ss. It is concluded that stronger control methods are needed to prevent inter-S communication, especially in an institutional setting.—P. McMillan.

902. Kugelmass, Sol & Liebllich, Amia. (Hebrew U., Jerusalem, Israel) **Perceptual exploration in Israeli children.** *Child Development*, 1970(Dec), Vol. 41(4), 1125-1131.—Tested 100 4-9 yr. old Israeli children and 22 undergraduates in an attempt to replicate and extend D. Elkind and J. Weiss's (see PA, Vol. 41:10213) study of Perceptual exploration. In general, results support the view that patterns of exploration may be described by the principles derived from psychomotor development. The influence of school experience was marked in all indices examined and could most specifically be seen in the right-left directionality expected to result from learning to read Hebrew.—*Journal abstract.*

903. Lewis, Michael & Baumel, Marcia H. (Educa-

tional Testing Service, Princeton, N.J.) **A study in the ordering of attention.** *Perceptual & Motor Skills*, 1970(Dec), Vol. 31(3), 979-990.—Hypothesized that there is an ordering in which environmental changes elicit differential degrees of attention. Data were gathered concerning the effect of various stimulus changes after stimulus repetition on 24 3-4 yr. olds. Results indicate an order of attending, with color, size, number, and rotation changes, in that order, showing the greatest orienting responses. Other data consistent with these results are reported and the argument is made that orienting reflex orders reflect important differences in cognitive function. (19 ref.)—*Journal abstract.*

904. Locke, John L. (Children's Research Center, Champaign, Ill.) **Acoustic vigilance behavior in four-year-old children.** *Psychonomic Science*, 1970(Oct), Vol. 21(2), 111-112.—Tested 40 male and 40 female 4-yr-old children on an acoustic vigilance task in which they were to signal the presence of pure tones which appeared irregularly, infrequently, and at faint supra-threshold levels. In several significant aspects these young Ss behaved similarly to adults. Acoustic vigilance testing is discussed as a potentially useful framework in which to assess and observe children's attentional behavior.—*Journal abstract.*

905. Olmsted, Patricia P. & Sigel, Irving E. (U. Florida) **The generality of color-form preference as a function of materials and task requirements among lower-class Negro children.** *Child Development*, 1970(Dec), Vol. 41(4), 1025-1032.—Investigated the generality of color-form preferences by administering several color-form tasks to the same group of Ss. These tasks employed geometrics, familiar objects, and pictures of these objects as stimuli; and sorting, categorizing, and matching-to-standard as procedures. It was hypothesized that preferences for individual Ss would be task specific. 41 lower-class black boys and 34 girls 61-76 mo. old served as Ss. Results indicate that the predominant mode of response varied with the tasks employed. Color-form preferences by age, sex, and school yielded no significant difference. Results also demonstrate the substantial role played by particular tasks in eliciting responses. It is concluded that generalizations regarding color-form dominance cannot be made for this population since preferences are task specific.—*Journal abstract.*

906. O'Reilly, Edmond & Steger, Joseph A. (Bard Coll.) **Children's use of context in judgment of weight.** *Child Development*, 1970(Dec), Vol. 41(4), 1095-1101.—Using the standard psychophysical experimental paradigm employing the anchor as a frame of reference, 25 children, ages 5, 6, 7, 9, and 11, judged a series of 5 weights. Results show that all Ss over 6 yr. old could both order the series (seriate) and shift their judgment of the whole series when presented with an anchor (transitivity). 5-yr-old Ss could not do either. Results suggest that seriation and the use of a relative frame of reference are cognitively confounded. The age at which these Ss performed these tasks is younger than has been previously noted. (20 ref.)—*Journal abstract.*

907. Ruuth, Egil. (Lund U., Psychological Lab., Sweden) **Afterimage perception and size-distance judgement in preschool children.** *Psychological Research Bulletin, Lund U.*, 1970, Vol. 10(14), 19 p.—Investigated perceptual development in 22 5-7 yr. old children. Color and size dimensions of projected visual afterimages and size-distance judgments were evaluated. Ss with a positive afterimage color made the least

size-constant judgments. When the 2 afterimage dimensions were used in a combined criterion, findings indicate an ontogenetic pattern of successive low-, high-, and intermediate-size constancy. Results are discussed in relation to the phenomena of overconstancy found in adults and extra- and intracognitive factors in perception.—*Journal abstract.*

908. Smith, Gudmund J. & Sjöholm, Lena. (Lund U., Psychological Lab., Sweden) **Afterimage change in children following reversal of the experimenter's theoretical message.** *Psychological Research Bulletin, Lund U.*, 1970, Vol. 10(9), 10 p.—Cross-validated a previous finding by G. J. Smith and L. Sjöholm (see PA, Vol. 44:20671) that children's afterimages (AI) may be affected by the AI theory presented to them. 29 9-10 yr. old children were given 3 measures of cognitive maturity. 14 Ss were then informed that AIs were a physical reality largely independent of the O, and the remaining Ss were informed that AIs were projected by the S himself. After 5 AI productions, the E pretended to have given the wrong instructions and gave the other set followed by 5 additional AI productions. It was found that instruction effects were facilitated both by S's ability to comprehend the instruction and the degree of correspondence between the "theoretical" message and the S's level of maturity.—*Journal abstract.*

909. Smith, Gudmund J. & Sjöholm, Lena. (Lund U., Psychological Lab., Sweden) **Projected afterimages after manipulation of cognitive schemes in children.** *Scandinavian Journal of Psychology*, 1970, Vol. 11(4), 274-279.—Predicted that telling 1 group of Ss that afterimages are a physical reality largely independent of the O and another group that afterimages are projected by the S himself, would result in differing reports of afterimages. In all 10 pairs of 9-yr-old boys and girls, matched with respect to cognitive maturity, the S getting the former instruction reported more size-constant and/or positive afterimages than the S getting the latter instruction.—*Journal abstract.*

910. Snyder, Robert T. & Pope, Peggy. (Prince George's County Board of Education, Upper Marlboro, Md.) **New norms for and an item analysis of the Wepman test at the first grade, six-year-level.** *Perceptual & Motor Skills*, 1970(Dec), Vol. 31(3), 1007-1010.—Conducted an item analysis and normative study of the Wepman Test of Auditory Discrimination with 204 6-yr-old 1st graders selected to be representative of the population at large. Serious discrepancies with the published norms were found not only with the criterion for identifying a child having problems of auditory discrimination but with the utility of the validity checks of excessive error counts (X errors) and the missing of same-sound phonemes (Y errors). For these Ss the mean error was 7 (standard deviation = 3.5) which would identify 67% as having auditory discrimination problems. Further, only 1 S would have been eliminated by the use of Y errors, and none of the 6 Ss who made excessive X errors missed 2 or more Y validity items. Those items which are hard for the 1st grader (sheaf-sheath, 76% miss) and which are easy (gum-dumb, 1/2% miss) are identified. Pearsonian correlations with other learning modalities, socioeconomic level, and a measure of reading readiness are offered.—*Journal abstract.*

911. Williams, Tannis M. (Purdue U.) **Some determinants of young children's responses to random forms.** *Dissertation Abstracts International*, 1970(Oct), Vol. 31(4-B), 2334.

Personality

913. Bergmann, Erzsébet. (Child Mental Health Care Center, Budapest, Hungary) **Pubertás korú tanulók személyiségképe Lakóhely-Konstruktív-Próba és Rorschach-jegyzőkönyv összehasonlítása alapján.** [Personality description of puberty-age schoolchildren based on comparing "Dwelling-Place Construction Test" data and Rorschach records.] *Magyar Pszichológiai Szemle*, 1970, Vol. 27(1), 72-77.—Presents case studies.—*M. Moore.*

914. Clack, Gerald S. (Washington U.) **Effects of social class, age, and sex on tests of perception, affect discrimination, and deferred gratification in children.** *Dissertation Abstracts International*, 1970(Oct), Vol. 31(4-B), 2275.

915. Clifford, Thomas & Cross, Michael S. (Kenya Coll.) **Response enhancement in children as a function of blocking at different distances from start and goal.** *Psychonomic Science*, 1970(Sep), Vol. 20(3), 327-329.—14 2nd and 3rd grade boys played a game in which they attempted to fill a tube to various levels with marbles. E blocked their progress at numerous points in an attempt to assess the contributions of distance from the start, distance from the goal, and total game length on S's response of hitting a dowel following blocking. Results suggest that distance from the start is a more potent variable affecting response strength following blocking than either distance from the goal or total game length.—*Journal abstract.*

916. Gochman, David S. (U. Michigan) **Some steps towards a psychological matrix for health behavior.** *Canadian Journal of Behavioural Science*, 1971(Jan), Vol. 3(1), 88-101.—Predictions related perceived internal control inversely to health problem expectancies and directly to probabilism, or uncertainty, within these expectancies. Questionnaire responses from 134 7-17 yr. old boys and girls revealed a significant relationship between probabilism and perceived internal control, but questioned the measurement and generality of internal control constructs. Perceived internal control and probabilism were directly related to age. Significant correlations suggest that (a) perceived vulnerability to health problems is a personality characteristic, and is the degree of probabilism within health problem expectancies exhibits the same organizational qualities shown in other perceptual-cognitive phenomena. Perceived internal control was not related to health problem expectancies. (French summary) (18 ref.)—*Journal abstract.*

917. Kent, James T. (U. Michigan) **Behavioral style and adjustment: A study of sibling differences.** *Dissertation Abstracts International*, 1970(Nov), Vol. 31(5-B), 2990.

918. Kolaříková, Olga. (Czechoslovak Academy of Sciences, Brno, Czechoslovakia) **Zájmové odpovědi na věku 10-13 let a jejich difference v závislosti na pohlaví a některých druzích abnormalnosti.** [Interest responses at the age of ten to thirteen years and their differences depending on sex and some other abnormalities.] *Psychológia a Patopsychológia Dieťaťa*, 1970

Vol. 5(3), 227-247.—Studies differences in interest responses in 10-13 yr. old children, with regard to sex and 2 kinds of abnormalities, i.e., institutional education and psychiatric morbidity. 2 normal groups of Ss and 4 abnormal ones were investigated. Interest responses were assessed by a reduced form of the original inventory, consisting of items relating to 16 fields of special interests. The normal group, differing in sex, showed dissimilarities which, as a whole, are in agreement with other findings. Furthermore, signs were found distinguishing the normal and abnormal groups with respect to interest responses. High scores in the interest fields, "adventure-exceptionality," appeared to be a sign of the normal groups, whereas the abnormal groups scored high in fields concerning "interpersonal relationships" and "art." When comparing the normal groups, some of the scores seemed to be masculine and others feminine signs. However, when comparing the normal and abnormal groups, some appeared simultaneously as a sign of abnormality. This is supported by other findings. (Russian summary) (20 ref.)—*English summary*.

920. Trunova, N. Ob izuchenii émoitsii u detei. [On the study of emotions in children.] *Doshkol'noe Vospitanie*, 1970(May), Vol. 43(5), 28-34.—10 3-3½ yr. old children were used to study the possibility of utilizing certain physiological indices in order to detect the emergence of "complex emotions" resulting from exposure to slides depicting scenes from fairy tales. Indices utilized were (a) pulse rate, (b) respiratory rate and ratio of inspiration to expiration time, and (c) GSR. The findings show that very young children are not non-participatory Os of events without direct relation to the latter. They actively experience the complex situations in which the characters of the fairy tales find themselves. Changes in automatic functions are shown to agree with observed behavior during the viewing of the slides. However, the former give a more complete and exact picture of the changes in emotional states.—*J. D. London*.

Social Behavior

922. Alden, Steven E., Pettigrew, L. Eudora, & Skiba, Edward A. (U. Bridgeport) *The effect of individual-contingent group reinforcement on popularity.* (*Child Development*, 1970(Dec), Vol. 41(4), 1191-1196. Investigated whether individual-contingent group reinforcement, when used in conjunction with verbal reinforcement, is an effective technique for increasing popularity in the classroom. Ss were 45 12-14 yr. old students, who were the 9 "least chosen" from 5 7th grade classes, as measured by a sociometric test. Results indicate that individual-contingent group reinforcement plus verbal reinforcement can increase popularity as measured through sociometric test scores. —*Journal abstract*

tative responses as a function of socioeconomic class, incentive-oriented set and reinforcement. *Dissertation Abstracts International*, 1970(Oct), Vol. 31(4-B), 2252.

924. Honig, Alice S., Caldwell, Bettye M., & Tannenbaum, Jordan. (Syracuse U.) *Patterns of information processing used by and with young children in a nursery school setting.* (*Child Development*, 1970(Dec), Vol. 41(4), 1045-1065. —Presents data using an observational technique, APPROACH, which describes the behaviors of young children in naturalistic social situations. Emitted behaviors are recorded on a tape recorder, transcribed, and then coded numerically for computer analysis. Results of assessments of information processing for 1.3-4.6 yr. old children show substantial changes in the way age groups handle information. The technique is structured to provide data on the incidence of growth-fostering or growth-inhibiting behaviors. (15 ref.)—*Journal abstract*.

925. Macrae, Julie A. (Queen's U., Belfast, Ireland) *Interpersonal perception: Some determinants and variables.* (*Papers in Psychology*, 1969(Oct), Vol. 3(2), 69-70.—Found significant positive and negative relationships when 32 6th form grammar school Ss were tested with respect to "cognitive complexity," "role-taking ability," "accuracy of prediction," "assumed similarity," and "personality congruence." The independent variables of sex, friendship, and sibling status were not found to be significant factors.—*S. L. Warren*.

926. Mumbauer, Corinne C. & Gray, Susan W. (George Peabody Coll. for Teachers) *Resistance to temptation in young Negro children.* (*Child Development*, 1970(Dec), Vol. 41(4), 1203-1207. —Employed a game-like situation to investigate the resistance to temptation of 48 female and 48 male disadvantaged 5-yr-old Negro children. Sex of I, sex of S, and father absence or presence were varied. Expectations based on potential influences of father absence were not confirmed. Boys and girls from father-absent homes did not differ significantly in their resistance to temptation. Boys from father-present homes resisted temptation more with a female I while girls resisted temptation more with a male rule giver. Findings are discussed in light of previous research by other investigators. A satiation-deprivation of social reinforcement explanation is suggested to account for the findings. —*Journal abstract*.

935. Bugental, Daphne E., Love, Leonore R., & Gianetto, Robert M. (U. California, Los Angeles) **Perfidious feminine faces.** *Journal of Personality & Social Psychology*, 1971(Mar), Vol. 17(3), 314-318.—Rated videotaped verbal and nonverbal (smiling) behavior of parents in interaction with their children. The socioeconomically matched sample included 20 families containing a disturbed child and 20 normal control families. An interaction was predicted and confirmed ($p = .05$) between parent sex and facial

expression; i.e., when a father smiled, he was making a friendlier or more approving statement than when he was not smiling; for mothers, there was no difference in the evaluative content of verbal messages when she was smiling vs. when she was not smiling. This pattern was found to be unrelated to child disturbance. Findings were, however, limited to middle-class families because the majority of lower-class mothers in this sample did not smile at all. (16 ref.)—*Journal abstract*

936. Makarenko, A. O. **roditel'skom avtoritete.** [On parental authority.] *Doshkol'noe Vospitanie*, 1970(May), Vol. 43(5), 51-55. Presents an analysis of the different forms of parental authority directed toward preschool-children: "suppression, distraction, swagger, pedantry ["bureaucratic perfectionism"], reason, love, kindness, friendship, and bribery." Their characteristics and effects are described and evaluated. It is necessary to distinguish genuine from false authority, based on arbitrary principles and striving to obtain obedience by any means whatsoever.—*J. D. London*.

937. Osofsky, Joy D. (Cornell U.) **Children's influences upon parental behavior: An attempt to define the relationship with the use of laboratory tasks.** *Genetic Psychology Monographs*, 1971(Feb), Vol. 83(1), 147-169.—Studied the socialization process in terms of the effects of children upon parents. Parents ($N = 65$ white, middle-class mothers) were observed interacting with role-playing children (age range, 10-12 yr.), who were not their own, in 3 structured laboratory situations using the Object Assembly Picture Arrangement, Block Design tasks. Results indicate that differences in children's behavior in the situations resulted in 1 consistency and several task specific differences in parental responses. The findings lent support to the proposal that children influence parental behaviors, just as parents influence children's behaviors in the socialization process. (37 ref.)—*Author abstract*.

940. Thoman, Evelyn B., Turner, Ann M., Leiderman, P. Herbert, & Barnett, Clifford R. (Stanford U., Medical School) **Neonate-mother interaction: Effects of parity on feeding behavior.** *Child Development*, 1970(Dec), Vol. 41(4), 1103-1111.—Developed a procedure for the study of feeding patterns of mothers with their newborn infants. By means of an automated recording system, time measures of components of bottle feedings were obtained without the presence of an O. The measures clearly discriminated the feeding behaviors of 22 18 38 yr. old primiparous and 22 multiparous mothers with their 2-day-old infants. Total observation times, including feeding and nonfeeding activities, were significantly longer for the primiparous pairs. The feeding portion of the observations was also longer for the primiparas. Although these mothers were more persistent in their feeding endeavors, they were also less effective in their efforts, as indicated by a lower total consumption of formula by their infants and by a lower rate of formula intake. Findings are related to studies of parity effects on the newborn and research on birth-order effects on older children.—*Journal abstract*.

957. Kessel, Frank S. (U. Alberta, Center for Advanced Study in Theoretical Psychology, Edmonton, Canada) **Social psychology, experimental psychology and the social psychology of the experiment.** *Canadian Journal of Behavioural Science*, 1971(Jan), Vol. 3(1), 114-126.—Discusses the recent growth of experimental social psychology which has involved wholesale adoption of classical methodology as conceived by experimental psychology. Paradoxically, research and writings on the "social psychology of the experiment" raise serious questions about certain assumptions implicit in classical methodology, i.e., those concerning the nature of the subject matter and the relationship between E and S. The views of R. Rosenthal, M. T. Orne, and others are discussed in this context and general implications considered in the light of the humanistic

movement in American psychology. The general conclusion is that the values and criteria for all experimentation in psychology may be destined to undergo a radical reorientation. (French summary) (32 ref.)—*Journal abstract*.

958. **Pechoux, Michel.** (U. Paris at the Sorbonne, France) **Sur la conjoncture théorique de la psychologie sociale.** [The theoretical unification of social psychology.] *Bulletin de Psychologie*, 1969-1970, Vol. 23(4 5), 290-297.—Discusses social psychology, its general aims, methodology, subject matter, and its historical antecedents and recent developments.—*R. E. Smith*.

959. **Wiesner, Jerome B.** (Massachusetts Inst. of Technology) **The need for social engineering.** In F. F. Korten, S. W. Cook, & J. I. Lacey (Eds.), "Psychology and the problems of society." (See PA, Vol. 46:Issue 1) 85-94.

CULTURE & SOCIAL PROCESSES

960. **Adler, Kurt A.** (Alfred Adler Inst., New York, N.Y.) **Adlerian view of the present-day scene.** *Journal of Individual Psychology*, 1970(Nov), Vol. 26(2), 113-121.—The scenes examined are the school, psychotherapy, drugs, the professional's social responsibility, guidance of youth, and rebellion and progress. Emphasis is placed on Alfred Adler's views that "the honest psychologist cannot shut his eyes to social conditions which prevent the child from becoming a part of the community. . . . Thus the psychologist must work against nationalism when it is so poorly understood that it harms mankind as a whole; against wars of conquest, revenge, and prestige . . . and against all other obstacles which interfere with the spreading of social interest."—*A. R. Howard*.

961. **Alger, Ian.** (New York Medical Coll.) **The superego in time of social conflict.** *Journal of Contemporary Psychotherapy*, 1970(Sum), Vol. 3(1), 51-56.—Examines values, social conflict, and superego development. Language is described not only as the method by which a culture codifies its values, but also as a method of delimiting reality. The current distrust of the value systems is seen as developing from many factors: (a) television, rapid transportation, and family mobility; (b) computerization; (c) the possibility of nuclear destruction; (d) the deterioration of the environment; (f) the population explosion; and (g) the emphasis on ethnicity. These stresses, conflicts, and exposures to new experiences and different values challenge the values of the society and the internalized values of the individual. The pressure of the times is for diffuse and flexible superegos capable of dealing with "situation ethics." It is suggested that group therapy may help the individual who seeks therapy for superego anxiety to interpret and clarify his current values and to reinforce the possibility of new value systems. The use of videotaped replay in this conjunction is described.—*S. Knapp*.

962. **Bennis, Warren G.** (State U. New York, Buffalo) **A funny thing happened on the way to the future.** In F. F. Korten, S. W. Cook, & J. I. Lacey (Eds.), "Psychology and the problems of society." (See PA, Vol. 46:Issue 1) 431-450.—Reviews earlier predictions of democratization of organizations and the rise of new, rapidly-changing temporary systems. Dilemmas requiring new perspectives on the future of the democratic process are discussed: the breakdown of legitimacy,

conflict of populist vs. elite functions, interdependence and complicity in the environment, lack of correct metaphor, and discontinuities between micro and macro systems. In conclusion forecasts of new trends for public bureaucracies are made.—*Author abstract*.

963. **Brody, Eugene B. (Ed.)** (U. Maryland, Medical School) **Behavior in new environments: Adaptation of migrant populations.** Beverly Hills, Calif.: Sage, 1969, 479 p. \$12.50.

964. **Bulatao, Jaime C.** (U. Manila, Philippines) **Mapping Manila society by photographs and factor analysis.** *Philippine Journal of Psychology*, 1969(Dec), Vol. 2(2), 6-11.—16 photographs of individuals taken in Manila were described through the use of 12 adjectives in a Q-technique and were intercorrelated. 20 male undergraduates served as Ss. The resulting matrix was factor analyzed and yielded 3 factors, which were interpreted as social classes, phenomenologically arrived at, i.e., (a) Westerner-Provinciano Filipino, (b) urban Filipino, and (c) Chinese.—*Journal abstract*

965. **Cheln, Isidor.** (New York U.) **The concept of power.** In F. F. Korten, S. W. Cook, & J. I. Lacey (Eds.), "Psychology and the problems of society." (See PA, Vol. 46:Issue 1) 327-343.

967. **Gagné, Raymond.** **Le Canada français: Les rapports intimes entre culture, langue et personnalité.** [French Canada: Close relationships between its culture, language and personality.] *Interprétation*, 1970(Jul), Vol. 4(3), 25-53.—Defines the concepts of culture, language, personality, and structuralism in the perspective of present-day sciences, attempting to demonstrate how clearly the structuralist hypothesis illustrates the close and inextricable relationships between these concepts; and describes the critical balance of dominant forces (the social dynamics making possible the preservation of a society's peculiar aspect in spite of constant internal and external pressures which tend so greatly to modify it from the linguistic and cultural viewpoint). As a result of linguistic and cultural confusion, the French Canadian is afflicted by "diverse linguistico-cultural psychoses." Inextricable ties between culture, language, and personality are seen at the base of the political and social disturbances in French Canada. If the French language and culture are not preserved in Quebec, they will not survive elsewhere in Canada.—*T. N. Webster*.

969. **Liff, Zanel A.** (Postgraduate Center for Mental Health, New York, N.Y.) **Impasse: Interpersonal, intergroup and international.** *Group Process*, 1970(Sum), Vol. 3(1), 7-30.—Discusses the impression that our society is currently characterized by an unwillingness to compromise or to reconcile, and that psychologically we avoid conflict resolution in favor of the impasse.—*A. Barclay*.

970. **Mangalam, J. J. & Schwarzweller, Harry K.** (U. Guelph, Ontario, Canada) **General theory in the study of migration: Current needs and difficulties.** *International Migration Review*, 1968(Fal), Vol. 3(1), 3-18.—Discusses the need for a more comprehensive,

general theoretical approach to the study of migration. Against a background of recent trends in migration research, drawn from the current literature, probable reasons are suggested for this lag in general theory building. In addition to a number of misconceptions about the nature of migration, and difficulties stemming from the sources of migration data which reinforce those misconceptions, the study of migration has suffered from a lack of concern on the part of our leading sociological theorists. (French, Spanish, & German summaries) —*Journal abstract.*

971. McCleary, Roland D. (Mark Twain School, Northlake, Ill.) **The violence of the privileged in the U.S.A.** *International Journal of Offender Therapy*, 1970, Vol. 14(2), 81-85.—Endeavors to explain the roots of violence noted in radical students, especially the children of the successful. The harshness and shortness of life in the historical past is contrasted to the extension of dependency and education required by present society. "We have actually extended the rivalry between father and son into a much later age than is healthy and by so doing we are setting up situations so complicated, frustrations so intense and hostility so guilt-ridden that no decent boy can turn on his self-sacrificing parents. Therefore, he must make the system the target for his violence." Compounding the souring of the old opportunities and the inadequacy of overprotective parents, the technological emphasis on immediacy leads the young to think that the solution to social problems is equally amenable to immediate solution. (French, German, & Spanish summaries)—*S. Knapp.*

972. Naftalin, Arrthur. (U. Minnesota) **The urban problem and action research.** In F. F. Korten, S. W. Cook, & J. I. Lacey (Eds.), "Psychology and the problems of society." (See PA, Vol. 46:Issue 1) 108-114.

973. Northway, Mary L. (Brora Center, Toronto, Ontario, Canada) **The sociometry of society: Some facts and fancies.** *Canadian Journal of Behavioural Science*, 1971(Jan), Vol. 3(1), 18-36.—Presents facts which have recurred in many sociometric studies and findings emerging from current research. The presentation is divided into 5 parts: sociometric affinities and diffinities; sociometric differential; persistence of personal relations; difference in sociometric structure of apparently similar groups; and developmental sociometry. Implications from each of these for guidance of the social growth of the individual and for amelioration of social organization are stressed. A point of view regarding the nature of society is described, i.e., that the affinities and diffinities among individuals provide the psychological basis for the human existing as a social being and form the groundwork that has made it possible for human society to develop. (French summary) (38 ref.)—*Journal abstract.*

974. Orpen, Christopher. (U. Cape Town, South Africa) **Prejudice and adjustment to cultural norms among English-speaking South Africans.** *Journal of Psychology*, 1971(Mar), Vol. 77(2), 217-218.—Tested the argument that adjustment to cultural norms is the crucial variable underlying the holding of intolerant attitudes toward outgroups in settings with prejudiced norms. 101 English-speaking white South African schoolchildren (average age = 16) were given 2 measures of intolerance toward minority groups and measures of the personal and social aspects of the degree of their accommodation to cultural norms—susceptibility to cultural pressure (social conformity) and adherence to culturally-approved

values (South Africanism). The significant correlations obtained between the prejudice, social conformity, and South Africanism scales are interpreted as supporting the argument.—*Author abstract.*

975. Rosner, Menachem. (Kibbutz Reshafim, Israel) **Communitarian experiment, self management experience and the kibbutz.** *Group Process*, 1970(Sum), Vol. 3(1), 79-100.—Discusses the possible interrelationships that might exist between communal experiences exemplified in the kibbutz, and their potential application to American culture. Certain aspects of the kibbutz movement and its relevance for present communal movements within the United States are reviewed.—*A. Barclay.*

976. Weidman, Hazel H. (U. Alabama, Medical Center) **Anthropological theory and the psychological function of belief in witchcraft.** *Southern Anthropological Society Proceedings*, 1968, No. 1, 23-35.—Reviews anthropological and psychiatric views in an attempt to explain witchcraft by a synthesis of the 2 systems. C. Kluckhohn's work on witchcraft, emphasizing ambivalence as the central dynamic factor, is considered in light of current psychiatric theory's stress on ego functioning. Focus is on the interrelationship of social ambiguity and psychological ambivalence. The inherent ambiguity of many social and individual situations is discussed, and it is concluded that witchcraft beliefs function in the maintenance of social and personality systems. "Belief in witchcraft may well serve the needs of a psychologically integrative process which helps to prevent a pathological reliance upon projection in the form of markedly psychotic episodes or in the form of elaborate delusional systems." This analysis is explained for different societies, and ongroup and individual levels. (22 ref.)—*C. R. Vestal.*

977. Wenk, Michael G. (Dept. of Immigration, Research & Information Div., Washington, D.C.) **Adjustment and assimilation: The Cuban refugee experience.** *International Migration Review*, 1968(Fal), Vol. 3(1), 38-49.—Describes a study of Cuban refugees in the United States. An 85-item questionnaire was sent to a sample of 200 Cuban families representing 534 adults and 593 children. Topics covered included questions concerning background, education, family composition, acceptance of the new environment, and degree of assimilation in the new culture. Results are detailed and suggest that the Cuban is self-sufficient, progressive, and eager to adapt to his new surroundings, and "possesses the will and energy to become a productive and beneficial member of society."—*P. McMillan.*

like everyone else, Oscar. *Psychology Today* 1970(Sep), Vol. 4(4), 26-32.—Oscar Lewis has written that the poor share a culture of poverty which poisons itself. However, lengthy interviews in 1960 with a 1960 survey of 100 poor Puerto Rican families suggest that "even small changes in the life of the poor in this society can bring about distinct changes in their values." Limited but real improvements in economic welfare of these people have given them a feeling that upward mobility is possible for anyone who sheds his vices and works very hard.—E. J. P. ... 989 Singh, N. P. (Delhi U., India) Different attitudes of agricultural entrepreneurs towards social and economic goals. *Indian Journal of Social Work* 1970(Jul), Vol. 31(2), 177-182.—Investigated the attitudes of progressive-traditional and successful-unsuccessful entrepreneurs (agricultural) of Delhi. Results from 80 Ss from 4 progressive and 4 traditional villages indicate that progressive successful Ss had a positive rating of their economic progress, liking for the profession for their sons, and a positive attitude toward modernization. The traditional and unsuccessful Ss had very different attitudes in the opposite direction. Implications of the findings are discussed.—J. W. Kane

989 Starny, H. G. & Green, R. I. (U. Strathclyde, Glasgow, Scotland) Working-class conservatism: A review and an empirical study. *British Journal of Sociology* 1971(Feb), Vol. 10(1), 10-20.

Examines the characteristics of manual working-class Conservatives. Intergeneration downward mobility is shown to make a substantial contribution to working-class conservatism. The embourgeoisement, social protest, and deference explanations of working-class conservatism are critically reviewed. A survey exploring the organization of attitudes in the working class is reported. A total of 69 variables constituting a questionnaire completed by 302 Ss produced differences between working-class Conservative and Labour supporters which correspond fairly well with the pattern of attitudes in a complementary survey of white-collar Ss. The deference explanation is reexamined on the basis of these results. S. L. Lipietz's analysis of working-class authoritarianism is also discussed. (35 ref.)—*Journal of ...*

marital role tension was related to the husband's acceptance of physical intimacy between mother and child, and his own psychophysiological condition. Enhancement of the wife's self-image, specifically her sexuality, was related to role differentiation in the basic family organization. Enhancement of the husband's self-image and level of communication were related to aspects of socioeconomic status and specifically to the wife's continued confidence in him as a husband 1st, then a father, when she becomes a mother. Sexual gratification and the reported frequency of integrative events are related to current and projected body image. The frequency of disintegrative events is related to naive romanticism.—*Journal abstract.*

Connecticut) **Images of man in early American sociology: II The changing concept of social reform.** *Journal of the History of the Behavioral Sciences*, 1970(Oct), Vol. 6(4), 317-334.—To give an overview of the major viewpoints on social reformism in the first era

of American sociology, a study of the 1st 5 presidents of the American Sociological Society—Sumner, Ward, Giddings, Small, and Ross—is presented.—C. M. Franks.

1014. **Spaner, Fred E.** (National Inst. of Mental Health, Community Mental Health Center Consultation, Chevy Chase, Md.) **The psychotherapist as an activist in social change: A proponent.** In F. F. Korten, S. W. Cook, & J. I. Lacey (Eds.), "Psychology and the problems of society." (See PA, Vol. 46:Issue 1) 58-62.

1015. **Ulrich, Roger & Wolfe, Marshall.** (Western Michigan U.) **Research and theory on aggression and violence.** *Science Teacher*, 1969(May), Vol. 36(5), 24-28.—Presents results of research on experimentally induced aggression in animals. Various aversive stimulation conditions and the aggressive behaviors they arouse, are discussed in terms of operant and classical conditioning of animal and human behavior. In contrast to these findings, the reaction to racial social movements in the United States is typified by a marked disregard for the application of behavior conditioning principles derived from animal experimentation. Thus, the non-violent solution to racial problems advocated by Dr. Martin Luther King was met with general apathy, while the violent demonstrations in Watts, California, and similar aggressive outbursts in other parts of the country, provoked an immediate reaction from the white community toward social reform. Implications for the application of behavior conditioning principles to social change and programs are discussed. (27 ref.)—P. Zell.

1016. **Kipnis, David & Vanderveer, Richard.** (Temple U.) **Ingratiation and the use of power.** *Journal of Personality & Social Psychology*, 1971(Mar), Vol. 17(3), 280-286.—Investigated the effect of subordinates' behavior on a leader's use of rewarding powers. It was predicted that an appointed leader would allocate more rewards to an ingratiating subordinate when faced with a hostile, rather than an inept, or no-problem, subordinate. An experimental test of this prediction with 30 male university freshmen received no support. It was found that the ingratiating subordinate received more than his share of the rewards, regardless of the presence or absence of a problem worker. The presence of a hostile subordinate caused the leader to dispense more rewards to all compliant subordinates. Results are discussed in terms of the effects of perceptual contrast on interpersonal perception.—*Journal abstract.*

SEXUAL BEHAVIOR

1017. **Bell, Robert R. & Chaskes, Jay B.** (Temple U.) **Premarital sexual experience among coeds, 1958 and 1968.** *Journal of Marriage & the Family*, 1970(Feb), Vol. 32(1), 81-84.—Presents a 1968 replication of a 1958 study of premarital sexual behavior and attitudes, using the same questionnaire with a sample of 250 coeds in the same university. The most important finding of the study was that the commitment of engagement has become a less important condition for engaging in premarital coitus and for whether or not guilt feelings will exist about their experience.—*Journal abstract.*

1018. **Berkov, Beth.** (U. California, Berkeley) **Illegitimate births in California.** *Milbank Memorial Fund Quarterly*, 1968, Vol. 46(4), 473-506.—Presents a methodology for statistical estimation of numbers, proportions, and rates of illegitimate births by age and race of mother. Better identification of illegitimate birth statis-

tics is derived from a coding system of birth certificates designed to protect mothers from public knowledge of concomitant factors of birth, e.g., congenital malformations, infant death, or illegitimacy. The sample consisted of 30% (N=18,125) of the birth records forwarded to the California State Health Department in the 1st 9 wk. of 1966. Results are reported by geographical distribution of live births and illegitimate live births by age and race of mother and birth order in the study sample in comparison with data from California, selected states, and the United States. Findings are compared with previous studies which attempted to discern underlying racial and social factors in illegitimate birth statistics. (19 ref.)—*P. Zell.*

1019. Gagnon, John H. & Simon, William. **They're going to learn in the street anyway.** *Psychology Today*, 1969(Jul), Vol. 3(2), 46-47, 71.—Suggests that meaningful sex education must develop out of the natural experiences of the child. This is complicated by the existence of great differences in the patterns of sexual development and interests of individual children. Males and females also have very different approaches to sex during adolescence. In order to have adequate sex education the adults must clarify their own goals and deal with honest issues of sexual relationships. Sex education cannot be truly successful until there is considerably more useful knowledge of how sex fits into the lives of people.—*E. J. Posavac.*

1020. Maranell, Gary M., Dodder, Richard A., & Mitchell, David F. (U. Kansas) **Social class and premarital sexual permissiveness: A subsequent test.** *Journal of Marriage & the Family*, 1970(Feb), Vol. 32(1), 85-88.—Tests I. L. Reiss' hypothesis that among conservatives those of higher social status are less permissive than those of lower status, while among liberals the relationship is in the opposite direction. Measures of fundamentalism, idealism, academic orientation, and authoritarianism were used independently to identify liberals and conservatives in a sample of 437 undergraduates. Both a chi-square and a sign test were applied to the data; neither confirmed Reiss' hypothesis. An extraordinarily strong relationship between permissiveness and the sex of the person, however, was found. Consequently the data was reanalyzed, while controlling for sex, to investigate the possibility that the validity of the hypothesis is contingent upon the sex of a person, but again the hypothesis was not confirmed.—*Journal abstract.*

1021. Simon, William. (Inst. for Juvenile Research, Chicago, Ill.) **Sex.** *Psychology Today*, 1969(Jul), Vol. 3(2), 23-27. Changes in the sexual climate of America appear to be profound if the openness with which sex is discussed is taken as the measure of such changes. The actual changes in behavior are often less profound, however. There does appear to be a greater tolerance for deviation from traditional sexual patterns partially as a result of a desire for more intense experience. Also, new directions in sexuality may be indicated by increasing emphasis on sexual competence.—*E. J. Posavac.*

Birth Control & Abortion

1022. Clark, Elizabeth W. (U. California, Berkeley) **A study of particular factors and their association with the adoption of family planning.** *Dissertation Abstracts International*, 1970(Oct), Vol. 31(4-B), 2095-2096.

1023. Ward, Audrey W. (U. Sheffield, Medical Care

Research Unit, England) **Family planning clinics in Sheffield, 1967.** *Journal of Biosocial Science*, 1969(Jul), Vol. 1(3), 207-219.—Surveyed 1048 new patients at family planning clinics in Sheffield over a 4-mo period. 242 visited clinics at the outset of marriage and 806 had been married at least 6 mo. The Family Planning Association (FPA) had 894 patients and the Local Authority (LA) had 154. Wives of nonmanual workers were overrepresented at FPA clinics but not at LA clinics. Wives of semiskilled and unskilled manual workers were generally underrepresented. There is some evidence that relative accessibility affects clinic attendance. The most commonly used methods of contraception used before the clinic visit were condom and coitus interruptus. Among those able to give a firm answer there had been more unplanned pregnancies than planned, except among the nonmanual groups. 96% of the perinatal and 20% of the other Ss were working full-time. The perinatal Ss were equally divided in their choice of clinic methods—pill or cap. Among the other Ss, 49% were prescribed the pill, 27% an intrauterine device, and 24% the cap.—*Journal summary.*

ATTITUDES & OPINIONS

1024. Baldwin, Bruce A. (Arizona State U.) **Dissonance induction-reduction utilizing cognitive and affective approaches among repressors and sensitizers.** *Dissertation Abstracts International*, 1970(Nov), Vol. 31(5-B), 2975-2976.

1025. Bem, Sandra L. & Bem, Daryl J. (Carnegie Mellon U.) **We're all nonconscious sexists.** *Psychology Today*, 1970(Nov), Vol. 4(6), 22-26, 115-116.—Studies have shown that students evaluate research articles attributed to a male more highly than when the same work was attributed to a female. Such attitudes naturally develop when the socialization process refuses to take the talents of women seriously. Genetic explanations of present American sex roles cannot account for the much larger place women have in Russian society. Even individuals who are aware of the problem and want to stop forcing wives to accept the role of the housewife, continue to treat the husband as the one who is doing the really serious work.—*E. J. Posavac.*

1026. Bruvold, William H. (U. California, School of Public Health, Berkeley) **Affective response toward uses of reclaimed water.** *Journal of Applied Psychology*, 1971(Jeb), Vol. 55(1), 28-33.—Developed 3 Thurstone-type attitude scales in order to assess public reaction to high contact uses of reclaimed waste water. The scales were evaluated by field survey research conducted in northern and southern California. Test-retest reliability coefficients ranged from .82-.92 and scale results met expectations regarding the influence of degree of contact and environment upon attitudes toward waste water reuse. The scales developed should be useful in future applied and theoretical research involving waste water reclamation.—*Journal abstract.*

1027. Cooper, Joel. (Duke U.) **The role of personal responsibility in the arousal of cognitive dissonance.** *Dissertation Abstracts International*, 1970(Nov), Vol. 31(5-B), 2955-2956.

1028. Condry, R. William; Keniston, Kenneth, & Cabin, Seymour. (Harvard Medical School, Boston, Mass.) **The war and military obligation: Private attitudes and public actions.** *Journal of Personality*, 1970(Dec), Vol. 38(4), 525-549. Studied the relation-

ship between attitudes toward the Vietnam war and willingness to sign a strongly worded and publicized antiwar resolution, in a random sample of 131 male college seniors at a selective liberal arts college. Level of opposition to the war did not fully explain why many strongly antiwar Ss did not sign the resolution. With level of opposition to the war held constant, personality measures and other attitudes differentiated between signers and nonsigners. It is hypothesized that the disposition to act publicly in support of private attitudes is a separate variable, which may be independent of the content and intensity of attitudes. (20 ref.)—*Journal summary*.

1029. Elms, Alan C. (U. California, Davis) **Pathology and politics.** *Psychology Today*, 1970(Feb), Vol. 3(9), 27-31, 58-59.—Conducted intensive interviews with 21 radical rightists from Dallas and similar numbers of moderates and liberals. Comparing the responses of the 3 groups revealed that most members of the far right were psychologically normal. Their espousal of very conservative political attitudes has been interpreted as a nearly pathological use of projection and displacement. These attitudes, however, can be better understood in terms of the functional approach to attitudes developed by Smith, Bruner, and White. Right-wing attitudes offer easily-mastered explanations of current political events and, for an individual living in Dallas, such attitudes are socially admired.—E. J. Posavac.

1030. Feather, N. T. (Flinders U. of South Australia, Bedford Park) **Balancing and positivity effects in social recall.** *Journal of Personality*, 1970(Dec), Vol. 38(4), 602-628.—Conducted 3 experiments in which Ss 1st rated an issue using the evaluation scales of the semantic differential, and subsequently wrote sets of arguments concerning the issue. Ss then rated each argument for the strength of their agreement or disagreement. Results in all studies show that Ss wrote a greater number of attitude-consistent arguments than attitude-inconsistent arguments (a balancing effect). The preponderance of attitude-consistent arguments increased as attitude became more extreme. (23 ref.)—*Journal summary*.

1031. Rak, Damian. (13 Gumbinnenstr., Munich, W. Germany) **Über die Lage des Nullpunktes in seelischen Bezugssystemen.** [On the position of the zero point in psychic frames of reference.] *Psychologische Beiträge*, 1970, Vol. 12(3), 393-400.—Investigated the problem of whether the experiences of pressure, psychic tension, equanimity are 2-sided instead of 1-sided as previously believed. It is suggested that the 0 point is located within the respective frames of reference and not at their margin.—*English summary*.

1032. Rambo, William W. & Fromme, Donald K. (Oklahoma State U.) **Structural characteristics of liberal-conservative attitudes: A note.** *Perceptual & Motor Skills*, 1970(Dec), Vol. 31(3), 970.—Administered a set of 109 Likert-type items purporting to tap the liberalism-conservatism attitude system to 234 middle-age, middle-class Ss and 106 undergraduates affiliated with organizations which could be placed at the left or right of the liberal-conservative scale. Results support the concept of a general factor in the liberal-conservative attitude domain. The pattern of loadings displayed convincing stability across both samples.—S. Knapp.

1033. Ray, John J. (Macquarie U., Sydney, New South Wales, Australia) **"A new measure of conservatism": Its limitations.** *British Journal of Social &*

Clinical Psychology, 1971(Feb), Vol. 10(1), 79-80.—Discusses a short format of the 1968 Conservatism (C) Scale of G. D. Wilson and J. R. Patterson (see PA, Vol. 43:15017), noting (a) a standardization defect in that none of the samples to which it was administered appeared to approximate a normal one, and (b) that it varied little from Wilson's and Patterson's 1968 C scale. "It is concluded that the C scale is not suitable for use with a sample randomly drawn from the general population." A table is included which shows the lack of discriminating power of the individual items.—P. Hertzberg.

1034. Romanynshyn, Robert D. (Duquesne U.) **A theoretical-empirical investigation of white-attitudes-toward-blacks and black-attitudes-toward-whites: A phenomenology of attitudes.** *Dissertation Abstracts International*, 1970(Nov), Vol. 31(5-B), 3005.

1035. Roos, Leslie L. (Northwestern U.) **Urbanization and modernization: Some computer-based experiments.** *Behavioral Science*, 1970(Jul), Vol. 15(4), 350-358.—The growth of data banks and possibilities for secondary analysis have made the development of techniques for generalizing from 1 group of individuals to another particularly desirable. Thus, when extensive survey data on villagers are available, it would be useful to be able to make reasonable predictions as to the distribution of urban attitudes on the same questions asked of the rural respondents. Such a technique is described here and applied to Turkish survey data (from 316 male respondents from metropolitan areas and approximately 8000 peasants) dealing with various attitudes deemed important for an understanding of the modernization process. Problems of model fit and the possibilities for utilizing this methodology with other data sets are discussed. (18 ref.)—*Journal abstract*.

1036. Ross, Michael; Insko, Chester A., & Ross, Hildy S. (U. North Carolina) **Self-attribution of attitude.** *Journal of Personality & Social Psychology*, 1971(Mar), Vol. 17(3), 292-297.—Conducted 2 experiments to investigate the effects of previous behavior on subsequent reports of attitude. In Exp. I 46 undergraduates were randomly assigned attitude responses which were represented as their own. The Ss' attitudes were then assessed. Results indicate that the assigned attitudes influenced the later reports of attitude. The final responses of Ss whose attitudes were assigned did not differ from those of Ss whose initial attitude responses were genuinely their own. In Exp. II with 125 undergraduates the consistency and number of supposed previous responses were varied. Results show that the consistency but not the number of previous responses affect final reports of attitude. $\frac{1}{2}$ the Ss in Exp. II were not strictly forbidden from altering their supposed previous responses. As predicted, fewer Ss changed their previous responses in the consistent response condition, than in either the single or inconsistent response conditions.—*Journal abstract*.

1037. Wells, James O. (George Washington U.) **An experimental study of the assignment of responsibility for unintentioned, subintentioned, and intentioned death.** *Dissertation Abstracts International*, 1970(Oct), Vol. 31(4-B), 2294-2295.

Formation & Change

1038. Carter, Richard F., Pyszka, Ronald H., &

Guerrero, Jose L. (U. Washington, School of Communication) **Dissonance and exposure to aversive information.** *Journalism Quarterly*, 1969(Spr), Vol. 46(1), 37-42.—Reports studies related to cognitive dissonance and motivation in dissonance. Study I induced 3 conditions: dissonance with commitment, dissonance without commitment, and control. Increasing aversiveness of the information evoked less avoidance in the dissonance conditions with college students. Study II consisted of questions dealing with car-buying decisions. An interest rating scale found that attacking the individual rather than the choice was less likely to produce avoidance in 38 graduate students' wives. Study III found that avoidance based on an attack on the choice rather than the individual led to more avoidance in 64 junior high school students. The studies were related to others in mass media and a possible interaction of cognitive and motive states was postulated.—J. A. Kline.

1039. Cautela, Joseph R., Walsh, Kenneth J., & Wish, Peter A. (Boston Coll.) **The use of covert reinforcement in the modification of attitudes toward the mentally retarded.** *Journal of Psychology*, 1971(Mar), Vol. 77(2), 257-260.—Tests the use of covert reinforcement (COR) to modify in a positive direction attitudes toward retardates. 42 undergraduates filled out a Mental Retardation Opinionnaire. 21 Ss (experimental group) practiced the COR procedure: 21 Ss (treatment-control) practiced imagination scenes without reinforcement. 3 wk. after treatment, posttest scores on the Opinionnaire were obtained. A *t* test showed that the COR group changed significantly ($p < .01$) in a positive direction over the treatment-control group. Data are interpreted in terms of (a) increased frequency of images of a retarded person, and (b) the association of reinforcement with a mentally retarded person.—*Author abstract*.

1040. Cialdini, Robert B. (Columbia U.) **Attitudinal advocacy in the verbal conditioner.** *Journal of Personality & Social Psychology*, 1971(Mar), Vol. 17(3), 350-358.—Investigated the effect of advocacy in a verbal conditioning situation. 135 undergraduates reinforced the opinions of "passersby" concerning the expansion of Federal power: $\frac{1}{2}$ reinforced conexpansion responses, and $\frac{1}{2}$ reinforced proexpansion responses. The passersby were experimental cohorts, who allowed Ss to experience either successful or unsuccessful verbal conditioning in a way that produced either high or low public commitment to the reinforced position in the conditioner. An advocacy effect was found, such that Ss reinforcing proexpansion responses subsequently became more pro than Ss reinforcing conexpansion responses. This effect was found to be specific to those interview items on which overt advocacy occurred. Results are interpreted according to the self-attribution theory of D. Bem as demonstrating that the self-perception of overt advocacy behavior is a determining condition for the production of attitudinal shifts in the direction of the advocated position. It is concluded that the intention or set to advocate, by itself, is not a sufficient condition for such shifts. (15 ref.)—*Journal abstract*.

1041. Crano, William D. & Messé, Lawrence A. (Michigan State U.) **When does dissonance fail? The time dimension in attitude measurement.** *Journal of Personality*, 1970(Dec), Vol. 38(4), 493-508.—Attempted to integrate findings related to the effect of differential

monetary reinforcement upon attitude change through the systematic variation of the time lag between conflict arousal and attitude measurement. Results indicate a dissonance effect ($p < .03$) in the immediate measurement condition, and a reinforcement effect ($p < .002$) with delayed attitude measurement. (17 ref.)—*Journal summary*.

1042. Edwards, John D. (Ohio State U.) **Resistance to attitude change as a function of the centrality and relatedness of bonded values.** *Psychonomic Science*, 1970(Sep), Vol. 20(6), 367-369. Experimentally induced initial attitudes were cognitively bonded to value statements varying on the dimensions of personal importance to 49 Ss and relevance to the attitude object. Neither variable affected the extremity of initial attitude. However, following discrepant information, attitude measures showed that bonding important values to initial attitudes conferred greater resistance to attitude change than either bonding to unimportant values or no bonding. This effect was obtained for both levels of value relevance. Value relevance did not affect resistance to attitude change.—*Journal abstract*.

1043. Frantz, Thomas T. (State U. New York, Buffalo) **Student and non-student change.** *Journal of College Student Personnel*, 1971(Jan), Vol. 12(1), 49-53. Investigated the changes in a group of 49 college seniors (29 male, 20 female) that had taken place since high school compared with changes in a similar age group of 34 individuals (10 male, 24 female) who had not attended college. All Ss completed a 5-factor scale: intellectual, social, moralism, traditional, and altruism. The groups were not similar in socioeconomic status or educational level. Test-retest reliability of the 5 factors ranged between .74 and .95. Few differences were obtained between the college and noncollege Ss. College students appeared to have become less judgmental, conservative, and moralistic. Most changes clearly took place on the social scale for both groups of Ss. College students became less moralistic and more tolerant about matters of religion, sex, and general conduct. The nature and extent of change among both groups were similar.—R. H. Mueller.

1044. Littlejohn, Stephen W. (U. Utah) **An experimental study of source credibility and communication exposure.** *Dissertation Abstracts International*, 1970(Nov), Vol. 31(5-B), 3028.

1045. Pallak, Michael S. & Heller, Jack F. (U. Iowa) **Interactive effects of commitment to future interaction and threat to attitudinal freedom.** *Journal of Personality & Social Psychology*, 1971(Mar), Vol. 17(3), 325-331.—Manipulated the variable of threat to attitudinal freedom in 62 undergraduates via a note from the S's partner which either arbitrarily assigned the S an attitudinal position (high threat) or solicited the S's attitudinal preference (low threat). With no expectation of future interaction with the partner (low commitment), greater negative attitude change was predicted under high threat than under low threat. With expectation of future interaction with the partner (high commitment), an attenuation of this effect was predicted, presumably because commitment to future interaction with the partner would forestall restoration of attitudinal freedom via negative attitude change. Significant Commitment \times Threat interaction on the attitude change measure confirmed the predictions.—*Journal abstract*.

1046. Penner, L. A. & Rokeach, M. (Michigan State U.) **The effects of employment condition on value**

systems. *Papers in Psychology*, 1969(Oct), Vol. 3(2), 47-51.—Interviewed 88 female and 133 male unemployed workers at a state unemployment office. Ss ranked Rokeach's 12 terminal and 12 instrumental values in order of their importance. In a follow-up study 7-9 mo. later, 66 Ss again ranked the values. Politeness decreased and broadmindedness increased for the Ss who were employed. For Ss still unemployed, equality and patience decreased while salvation, politeness, and tenderness increased. For the "temporarily unemployed-still unemployed" group, the decrease in the importance of equality was beyond the .002 level of confidence. The relationship between employment condition and value importance changes is discussed in terms of variations in employment expectations.—*S. Knapp.*

1047. Stone, Vernon A. & Eswara, Harrogadde S. (U. Wisconsin) **The likability and self-interest of the source in attitude change.** *Journalism Quarterly*, 1969(Spring), Vol. 46(1), 61-68.—Studied the effects of arguing for and against one's self-interest, and communicator likability, in persuading an audience. 168 undergraduates were provided with a pamphlet describing the TV coverage in the courtroom issue, and the sources (a lawyer and a journalist). Attitudes were assessed on bipolar scales before and after the speakers were heard, and the results indicate that a low likable source arguing against his self-interest was more effective than when arguing for his self-interest. In high likability conditions there was no difference. Self-interest interacted with other variables rather than being a main effect. Overlap is noted between credibility and likability which seem to operate independently enough to warrant separate consideration.—*J. A. Kline.*

Influence & Behavior

1048. Hendrick, Clyde & Taylor, Stuart P. (Kent State U.) **Effects of belief similarity and aggression on attraction and counteraggression.** *Journal of Personality & Social Psychology*, 1971(Mar), Vol. 17(3), 342-349.—Studied the effects of varying belief similarity on a behavioral variable (aggression) and interpersonal attraction. 48 male undergraduates competed with a pseudo-opponent on a RT task. On each of several trials Ss set varying levels of shock which they wished the opponent to receive if the latter lost on that trial, and received shocks the opponent set for them if they lost. S's shock setting constituted a direct measure of aggression. Ss competed against an opponent who was either similar or dissimilar in attitudes, and who was either aggressive or nonaggressive, and then evaluated the opponent on several scales. Results show that only aggression of the opponent affected Ss' counteraggression. Both opponents' aggressiveness and belief similarity affected attraction. It is suggested that the common sense assumption that attraction mediates aggression may be incorrect. The 2 variables may be independent with different sets of determinants. The everyday observation of co-occurrence of liking and aggression may be due to the simultaneous activation of their separate independent variables. (18 ref.)—*Journal abstract.*

1049. Meichenbaum, Donald H. (U. Waterloo, Ontario, Canada) **Examination of model characteristics in reducing avoidance behavior.** *Journal of Personality & Social Psychology*, 1971(Mar), Vol. 17(3), 298-307.—Examined the relative efficacy of 2 model characteristics in reducing avoidance behavior using a

2 × 2 factorial design. Fearless vs. coping behavior and behavioral and cognitive modeling vs. behavioral modeling alone were studied. 36 female undergraduates with an extreme fear of nonpoisonous snakes were assessed twice on a graduated behavioral approach test and on self-report measures of fearfulness. Between approach tests Ss observed 3 televised female models in the same approach situation. The behavioral and affective self-report measures indicate that observation of coping models, who initially demonstrate fearful behavior, subsequently model coping, and finally mastery behaviors, is significantly superior to mastery models in enhancing fear reduction. The addition of the models' self-verbalization to the coping condition significantly enhanced treatment effectiveness. Results indicate that a coping self-verbalizing model was the most effective model to reduce avoidance behavior. Factors required to facilitate modeling treatment of avoidance behavior are discussed. (37 ref.)—*Journal abstract.*

1050. Novak, David W. (U. Kentucky) **Social psychological processes and reactions to the handicapped.** *Dissertation Abstracts International*, 1970(Oct), Vol. 31(4-B), 2262.

GROUP & INTERPERSONAL PROCESSES

1051. Aronoff, Joel & Messé, Lawrence A. (Michigan State U.) **Motivational determinants of small-group structure.** *Journal of Personality & Social Psychology*, 1971(Mar), Vol. 17(3), 319-324.—Reports an investigation of individual motivation as a determinant of group structure. 50 male undergraduates high on either safety or esteem needs were homogeneously formed into 10 5-S groups. All groups were given a standardized set of tasks, and Ss' task-oriented behaviors were coded using Borgatta's interaction process scores. As predicted, safety groups tended to establish a more hierarchical social structure, in that task-oriented behaviors consistently were concentrated in fewer Ss in safety groups than in esteem groups. It is concluded that groups tend to organize themselves in ways that are compatible with the motivations of their members. (18 ref.)—*Journal abstract.*

1052. Barbour, Alton. (U. Denver) **Sociometric meaning in interpersonal relationships.** *Group Psychotherapy*, 1968(Dec), Vol. 21(4), 193-201.—The meaning of sociometry as a methodology is explained, and various research ideas are explored, each aimed at increasing knowledge of interpersonal relationships. (29 ref.)—*A. Krichev.*

1053. Baron, Robert A. (U. South Carolina) **Magnitude of victim's pain cues and level of prior anger arousal as determinants of adult aggressive behavior.** *Journal of Personality & Social Psychology*, 1971(Mar), Vol. 17(3), 236-243.—Hypothesized that: (a) under conditions where Ss were not angered prior to their opportunity to aggress, increments in the magnitude of pain cues emitted by the victim would lead to corresponding reductions in the strength of the attacks against this individual; and (b) under conditions where Ss were angered before aggressing, it was predicted that increments in the magnitude of pain cues from the victim would either fail to inhibit or actually tend to facilitate subsequent aggression. Results of an experiment with 60 male undergraduates indicate that Ss direct more intense attacks against the victim under the angered than the nonangered condition, but the strength of these attacks

decreases significantly under both conditions as the magnitude of pain cues from the victim increases.—*Journal abstract.*

1054. **Baron, Robert A.** (U. South Carolina) **Magnitude of model's apparent pain and ability to aid the model as determinants of observer reaction time.** *Psychonomic Science*, 1970(Nov), Vol. 21(4), 196-197.—Investigated the effects of magnitude of apparent suffering of a live peer model and the instructions concerning their ability to aid this individual on O.R.T. It was predicted that under conditions where Os were informed that they could influence the suffering of the model by the speed of their responses, RT would decrease as the magnitude of pain evidenced by this individual increased. However, under conditions where Os were informed that they could not aid the model, it was expected that RT would actually increase as the degree of pain shown by this person increased. Results of an experiment with 32 female undergraduates support these predictions.—*Journal abstract.*

1055. **Bell, Cecil H.** (Boston U., Graduate School) **The effects of group size on bargaining outcomes and interaction patterns in a mixed-motive game.** *Dissertation Abstracts International*, 1970(Nov), Vol. 31(5-B), 3014.

1056. **Bindrim, Paul.** (2000 Cantata Dr., Hollywood, Calif.) **Nudity as a quick grab for intimacy in group therapy.** *Psychology Today*, 1969(Jun), Vol. 3(1), 24-28.—Based on the possibility that nudity might hasten the process of becoming emotionally open, a nude marathon encounter weekend was conducted. Results of the 1st nude marathon were improved self-confidence and acceptance of others. On the basis of the results of 38 nude marathons, it is suggested that "controlled skin contact might be therapeutic in and of itself."—*E. J. Posavac.*

1057. **Cohen, Stephen L. & Jaffee, Cabot L.** (U. Tennessee) **The effects of varying the number of conditioned leaders on group problem solving.** *Psychonomic Science*, 1970(Oct), Vol. 21(2), 95-96.—Divided 120 male undergraduates into 30 4-man groups. The independent variable was the number of persons reinforced for verbal output in a group problem-solving situation: (a) in 10 groups, only 1 S was reinforced; (b) in 10 others 2 Ss were reinforced; and (c) in another 10 groups, all 4 Ss were rewarded for their verbal participation. The dependent variables investigated were the amount of time necessary for solution of the problems and the total number of conflict remarks generated during those sessions. Results indicate that the b groups took significantly longer to come to solution of the problem than either of the other 2 conditions. The number of conflict remarks, however, did not discriminate among treatments. Evidence suggests that the probable cause of the b groups' poor performance is due to the significantly greater number of conflict statements generated by the initial high talker than were in the other 2 treatments. (24 ref.)—*Journal abstract.*

1058. **Coulson, William, et al.** (Center for Studies of the Person, La Jolla, Calif.) **Inside a basic encounter group.** *Counseling Psychologist*, 1970, Vol. 2(2), 1-55.—Describes the transcript of a 16-hr weekend encounter group consisting of 10 members, 2 of whom were "facilitators" (group leader-psychologists). Carl Rogers and Richard Farson. The other 8, a heterogeneous group, were comprised of strangers to one another, yet willing to engage in a "first-time filming of

an encounter group." From the 1st hr., chiefly marked by "cautious garble," the group reached a point of personal concern by the 16th hr. Regarding the encounter group as "what happens when you have a lot of time to spend with people and no agenda," it was characterized by (a) feedback; (b) "explicating the implicit," i.e., implicit became explicit; (c) being personal; (d) identification; (e) expressing intention; and (f) movement of the body. The only requisite for an encounter group is that there be an "occasion" for it. Basic encounter groups are effective in terms of immediate process changes; knowing you are loved is a potent event, but adverse effects include returning home a changed person so that you are no longer effective as a "company man," and "bashing people with openness," e.g., shocking people. Responses by R. J. Corsini, M. Lakin, M. M. Ohlsen, N. Kagan, and L. D. Goodstein, and a rejoinder by W. Coulson are included.—*W. S. Sahakian.*

1059. **Crott, Helmut W.** (U. Mannheim, W. Germany) **Konfliktverhalten: Eine experimentelle Untersuchung zum kooperativen Zwei-Personen-Spiel.** [Conflict behavior: An experimental investigation into a cooperative two-persons-match.] *Dissertation Abstracts International*, 1970(Nov), Vol. 31(5-B), 2956.

1060. **Davis, James H., Bates, Peter A., & Nealey, Stanley M.** (U. Illinois) **Long-term groups and complex problem solving.** *Organizational Behavior & Human Performance*, 1971(Jan), Vol. 6(1), 28-35.—Previous research with ad hoc laboratory groups has suggested that a model assuming the emergence of an equalitarian social structure predicts better the problem solving performance of small groups than an alternative model assuming a hierarchical structure. This experiment studied 19 long-term groups and 43 individuals having substantial interpersonal experience during a business game that continued for several wk; the hierarchical but not the equalitarian model could be rejected as an accurate description of group performance. A strong cultural value stressing equalitarianism is proposed as 1 of several possible explanations.—*Journal abstract.*

1061. **Delbecq, Karl H.** (State U. New York, Binghamton) **Conceptions of group decision and group conflict applied to vector space: A research model.** *Acta Psychologica, Amsterdam*, 1970(Dec), Vol. 34(4), 440-450.—Attempts to integrate and clarify basic theory and to discuss research methods and concepts for the description and measurement of the group decision process. Ways for describing and measuring the speed, accuracy, and ultimate satisfaction of group decisions are proposed and related to (a) controllable conditions which may be manipulated (b) the interaction in the group which cannot be controlled, and (c) the personality characteristics and attitudes of the group members. The result of this attempt is a vector model which describes decision making in terms of attitudes. It makes use of a new line of research which has become known as dynamic calculus.—*Journal abstract.*

1062. **Eagly, Alice H.** (U. Illinois) **Leadership style and role differentiation as determinants of group effectiveness.** *Journal of Personality*, 1970(Dec), Vol. 38(4), 509-524.—All-male and all-female groups discussed a case history and provided a statement of their analysis of the case. The relationship between leadership style, as measured by Friedler's Least Preferred Co-worker (LPC) instrument, and task effectiveness (quality of the statement) was investigated for both the top task contributor and the best-liked member of the group.

LPC of the top task contributor did not relate to task effectiveness. In the role-differentiated groups, LPC of the best-liked member related positively to task effectiveness in the male groups and negatively in the female groups.—*Journal summary*.

1070. Griffitt, William; Byrne, Donn, & Bond, Michael H. (Kansas State U.) **Proportion of positive adjectives and personal relevance of adjectival descriptions as determinants of attraction.** *Journal of Experimental Social Psychology*, 1971(Jan), Vol. 7(1), 111-121.—Hypothesized that the positive and negative descriptive adjectives used in investigations of impression formation would influence attraction responses in the same linear fashion as had been established for similar and dissimilar attitudes. It was also hypothesized that the motivational context of the stimuli would be positively related to the steepness of the linear function. With 2 independent samples of 63 and 90 undergraduates, 3 sets of adjectives of differential favorableness were presented at 3 levels of personal relevance. Analysis of variance indicates strong support for the 1st hypothesis ($p < .001$) but no support for the 2nd. Instead, as personal relevance increased, the magnitude of the attraction response increased ($p < .001$). An interaction ($p < .05$) between proportion and relevance suggests that Ss in the high relevance condition tended to discount inconsistent negative adjectives to a greater extent than those in the low and medium relevance conditions. 1971(Mar), Vol. 17(3), 250-258.—Conducted an experiment to assess the efforts of race vs. belief similarity on interpersonal evaluations. Videotaped interaction was used to manipulate both variables. 40 undergraduates observed 2 white and 2 black actors discussing an issue and then evaluated them. 1 white and 1 black agreed with the Ss' position, and the remaining pair disagreed. Results show strong belief effects, but few race effects, confirming previous research. A 2nd experiment employed only the video portion of the tape in order to study assumed similarity and attraction. Results show some assumed dissimilarity of blacks, but it was unrelated to attraction. Rather, the expressive behaviors of actors determined attraction, while racial membership had no effect at all. 1074. Husbands, C. T. (U. Illinois, Chicago Circle) **Some social and psychological consequences of the American dating system.** *Adolescence*, 1970(Win), Vol. 5(20), 451-462.—Relates the superficiality and lack of emotional commitment in the American pattern to instability of marriages.—A. B. Warren

1075. Jaffee, Cabot L., Richards, Steven A., & McLaughlin, Gerald W. (U. Tennessee) **Leadership selection under differing feedback conditions.** *Psychonomic Science*, 1970(Sep), Vol. 20(6), 349-350. Under 2 differing feedback conditions (specific and nonspecific) leadership voting within 27 small groups of female undergraduates ($N = 3$ each) was analyzed. It was found that modifying the percentage of reinforcement to different Ss influenced voting behavior significantly, and that Ss in the 2 treatment conditions did not differ in their ability to match votes with reinforcements. It was felt that Ss respond more rapidly to duration of speech rather than quality of speech in voting for leaders.—*Journal abstract*.

1076. Jastrebske, Ellen M. & Rule, Brendan G. (U. Alberta, Edmonton, Canada) **Effects of group variance and advocated position on conformity.** *Journal of Personality*, 1970(Dec), Vol. 38(4), 550-559.—Employed a $2 \times 2 \times 2$ factorial design to test the influence of amount of group variance, direction of advocated shift, and judgmental instruction sets on conforming responses. The hypothesis predicted an interaction where conformity was maximized, with less variance under empirical validation instructions and more variance under social validation instructions. Ss changed opinions significantly more when the group advocated agreement than when it advocated disagreement on the issue. (17 ref.)—*Journal summary*.

1077. Julian, James W. & Kimball, Richard K. (State U. New York, Buffalo) **Effects of task orientation and level of prior agreement on willingness to agree.** *Psychonomic Science*, 1970(Nov), Vol. 21(4), 213-215.—Examined the effects of prior agreement from others on Ss' subsequent willingness to agree under both individual and group-oriented conditions. 160 female undergraduates served as Ss. Under both orientations, the level of subsequent agreement was highest following unanimous (100%) prior agreement from others, lowest following strong partial (75%) agreement, and moderate following still lower levels of prior agreement (50 and 25%). The applicability of social exchange formulations was tested and found inadequate under circumstances

where the prospect of future gain from the exchange was minimal.—*Journal abstract.*

1078. Kahn, Arnold; Hottes, Joe, & Davis, William L. (Iowa State U.) **Cooperation and optimal responding in the Prisoner's Dilemma game: Effects of sex and physical attractiveness.** *Journal of Personality & Social Psychology*, 1971(Mar), Vol. 17(3), 267-279.—Predicted that males would make choices in the Prisoner's Dilemma (PD) game in such a way as to maximize their winnings, while females would alter their choices on the basis of the social nature of the setting. 2 PD game studies were undertaken in which, for $1/2$ the Ss, the cooperative response would lead to higher winnings, while for the remaining Ss the competitive choice was optimal. In the 1st study 40 undergraduates played with like-sex partners, while in the 2nd study 80 Ss played with opposite-sex partners, whose physical attractiveness varied. Both studies found males more likely than females to make the optimal choice, while females were more likely to vary their choices as a function of the sex and attractiveness of their partner. Findings suggest that males and females do not have differential motives to cooperate, but respond to different cues. (26 ref.)—*Journal abstract.*

1079. Kazdin, Alan E. & Bryan, James H. (Northwestern U.) **Competence and volunteering.** *Journal of Experimental Social Psychology*, 1971(Jan), Vol. 7(1), 87-97.—Designed 2 experiments to determine the effect of competence upon aiding behavior. It was hypothesized that competence, particularly that relevant to the aiding response, would increase 96 undergraduates' willingness to volunteer help. Competence was manipulated by indicating to the Ss that they were either physically fit (task-relevant response) or possessed creative ability (task-irrelevant). The dependent variable was the S's volunteering to donate blood. Results in both studies support the hypothesis that competence increases volunteering behavior although task relevance had no effect. (19 ref.)—*Journal abstract.*

1081. Kennedy, John L. (U. Southern California, School of Business Administration) **Simulation study of competition in an "open world."** *Journal of Applied Psychology*, 1971(Feb), Vol. 55(1), 42-45.—5 3-man teams competed in a business game in an environment in which behavioral access to the simultaneous behavior of a competing team by means of closed-circuit TV and sound could be purchased. Switching to other teams made possible nearly continuous surveillance of all the competitors. Preliminary results describe the various adaptations of the teams to this unusual technological capability. Speculations on the implications of such research for the worlds of business and international relations are included.—*Journal abstract.*

1082. Kennedy, John L. (U. Southern California, School of Business Administration) **The system approach: A preliminary exploratory study of the relation between team composition and financial performance in business games.** *Journal of Applied Psychology*, 1971(Feb), Vol. 55(1), 46-49.—Asked 16 3-5 man self-organizing teams, composed to vary on a dimension of conceptual complexity of the individual members, to compete in a laboratory-based business game. Competitive performance was measured in terms

of profit or loss accumulated over a 12-wk period of operations. Variation in team size (3-5 members) was not related to performance. The primary composition variable, conceptual complexity, as measured by a Paragraph Completion Test, was significantly related to financial performance. *Journal abstract.*

1083. Kleinke, Chris L. & Pohlen, Paul D. (Claremont Men's Coll.) **Affective and emotional responses as a function of other person's gaze and cooperativeness in a two-person game.** *Journal of Personality & Social Psychology*, 1971(Mar), Vol. 17(3), 308-313.—Investigated the influence of context upon attitude toward a gazing person. 50 male undergraduates played a Prisoner's Dilemma (PD) game with a confederate whose gaze (constant vs. no gaze) and cooperativeness (100% cooperative, 90% cooperative, and 100% competitive) were manipulated in a 2×3 factorial design. The 1st part of the study found that Ss' ratings of the confederate on liking and partner preference were significantly affected by cooperativeness but not by gaze. Significant Gaze \times Cooperation interactions occurred for Ss' self-ratings on friendly-hostile and cooperative-competitive scales. Ss in the 100% competitive-gaze and 100% cooperative-no gaze groups saw themselves as friendly and cooperative, while Ss in the 100% competitive-no gaze and 100% cooperative-gaze groups gave hostile and competitive self-ratings. Although Ss in the 100% competitive-gaze condition rated themselves as cooperative, their actual PD game behavior was highly competitive. Part 2 of the study supported the hypothesis of A. Kendon (see PA, Vol. 41:5907) that gaze and emotional arousal are functionally related by showing that Ss in the gaze condition had significantly higher heart rates than Ss in the no gaze condition. Heart rates for all Ss decreased significantly during the course of the experiment. (25 ref.)—*Journal abstract.*

1084. Lakin, Martin. (Duke U., Sensitivity Training & Group Process Lab.) **Group sensitivity training and encounter: Uses and abuses of a method.** *Counseling Psychologist*, 1970, Vol. 2(2), 66-70.—A call is issued to demand higher standards of trainer development and preparation, and to discriminate between good and bad theory, good and bad marginal practice. Goals, conceptions, rationales, and results to date require reassessment. Over 2 decades growth gives the training movement, an American phenomenon, its majority, proceeding from a learning experience with therapeutic side effects to a therapeutic experience with learning side effects. In considering the functions of the trainer, sensitivity, judgment, and the understanding required demand relative chronological and emotional maturity. Training groups provide intimacy, belongingness, authenticity, and feedback. Although trainers generally are ethical, moral dilemmas occasionally occur. It is not advisable to employ encounter groups in structureless confrontations of hostile subgroups (e.g., Jews-Arabs). W. S. Sahakian.

1086. McMillen, David L. (Mississippi State U.) **Transgression, fate control, and compliant behavior.** *Psychonomic Science*, 1970(Oct), Vol. 21(2), 103-104.

—Tested the hypothesis that increased "fate control" will lead to increased compliance in 32 male undergraduates. Fate control was manipulated by inducing S

to tell a lie about information he had received and then make use of the information. Other Ss were induced to lie but could not make use of the information. Controls who told no lie were included in the design. Significant compliance was observed in the "fate control" group only.—*Journal abstract.*

1087. McNeel, Steven P. & Messick, David M. (Southern Illinois U.) **A Bayesian analysis of subjective probabilities of interpersonal relationships.** *Acta Psychologica, Amsterdam*, 1970(Dec), Vol. 34(2-3), 311-321.—Investigated Ss' perceptions of the likelihood of several interpersonal relationships in hypothetical 2- and 3-person groups. 29 undergraduates judged the probability that 2 people were joined by a specific interpersonal relationship, given various amounts and kinds of prior information regarding the incidence of that relationship in the group. The Bayesian likelihood ratio, computed from initial probability levels and amount of change due to the information, was assumed to measure the impact of the information on the S. The likelihood ratios provided fairly strong verification for the predictions of balance theory and suggested other cognitive biases also function in Ss' processing of information about social relationships. It is suggested that the likelihood ratio provides an appropriate and convenient measure of the informativeness of a stimulus in any situation in which probabilities can be estimated. It is also suggested that the consideration of humans as Bayesian processors of social information may have important theoretical and methodological implications for research in the area of belief change.—*Journal abstract.*

1091. Pepitone, Albert. (U. Pennsylvania) **The role of justice in interdependent decision making.** *Journal of Experimental Social Psychology*, 1971(Jan), Vol. 7(1), 144-156.—A motivational analysis of decision making in which payoffs are interdependent suggests that choices can be regarded as means of allocating rewards in accordance with certain ethical principles, which may not correspond to rational decision criteria of the sort proposed by statistical decision and game theorists, e.g., maximizing expected utility. Specifically, Individuals a

and b appear to make maximizing choices with the frequency that is required to maintain or achieve justice in the distribution of rewards—a condition quantitatively defined as equality of the ratios of their perceived relative merit (X) to the amount of reward (R) felt to be deserved. Thus, $X_a/R_a = X_b/R_b$. Experiments with 2 undergraduates designed to test hypotheses derived from this exchange theory of choice behavior yielded entirely affirmative results.—*Journal abstract.*

1094. Reilly, Richard R. & Jaffee, Cabot L. (Educational Testing Service, Princeton, N.J.) **Influences of some task-irrelevant factors on leader selection.** *Psychological Record*, 1970(Fal), Vol. 20(4), 535-539.—Studied the effect of 3 task-irrelevant factors on leader selection under 2 conditions of task-reward in a 2⁴ factorial design. 96 groups of 3 female Ss each participated in problem-solving sessions with an experimental confederate. The status, verbal participation, and confidence factors all significantly influenced Ss' voting behavior under both reward conditions. Ss made significantly more self votes under the high reward conditions, however. Results also suggest that Ss' estimations of the number of problems solved by the experimental confederate were influenced by the confidence and verbal participation factors.—*Journal abstract.*

1097. Streufert, Siegfried & Castore, Carl H. (Purdue U.) **Information search and the effects of failure: A test of complexity theory.** *Journal of Experimental Social Psychology*, 1971(Jan), Vol. 7(1), 125-143.—Examined the effects of increasing failure and the structural complexity of decision-making teams on 4 aspects of information search and utilization. 24 structurally homogeneous dyads (male volunteers) and 12 unselected control dyads served as Ss in a complex experimental simulation running for 6 30-min periods. Information load was held constant at 7 inputs period. The proportion of failure inputs was sequentially increased from 1:7 in Period 1 through 6:7 in Period 6. Dyads in the control condition were not exposed to failure. It was found that structurally simple Ss engaged in more delegated information search than complex Ss. Self-initiated information search initially increased, then remained fairly constant at higher proportions of failure. Contrary

to expectations, no differences were found between simple and complex Ss in self-initiated search. Complex dyads exceeded simple dyads on 2 measures of information utilization. The number of search moves used in integrative decisions produced an inverted U-shaped curve with optimal levels at moderate proportions of failure. Efficiency of information utilization showed a general decrease as failure increased. Data give limited support for complexity theory and support, where applicable, the information search theories of J. T. Lanzetta and N. T. Feather. (45 ref.)—*Journal abstract*.

Influence & Communication

1101. Allen, Vernon L. & Levine, John M. (U. Wisconsin) **Social pressure and personal preference**. *Journal of Experimental Social Psychology*, 1971(Jan), Vol. 7(1), 122-124.—Investigated R. S. Crutchfield's (see PA, Vol. 30:2454) contention that preference judgments are uniquely immune to group pressure. 81 undergraduates were tested in same-sex groups of 5. Controls were unaware of the answers of the rest of the group, experimental Ss answered last in turn, and E simulated group responses to apply group pressure. Effects of social pressure were measured by changes in responses to 20 stimuli given several weeks earlier under experimental conditions. Results strongly indicate that group pressure did influence preference judgments.—*Journal abstract*.

1102. Allen, Vernon L. & Levine, John M. (U. Wisconsin) **Social support and conformity: The role of independent assessment of reality**. *Journal of Experimental Social Psychology*, 1971(Jan), Vol. 7(1), 48-58.—Investigated the role of 1 factor in the reduction of conformity produced by a partner who agrees with the S in the face of group pressure: the independent assessment of social and physical reality provided by the partner. Ss were 123 undergraduates. 2 social support conditions were created, differing only in S's perception of his partner's adequacy as a valid referent for making judgments. A unanimous group was also included to provide a conformity base line. Results indicate that the valid social support condition produced a significantly greater decrease in conformity than the invalid social support condition, though both conditions reduced conformity relative to the unanimous group. Results

support the hypothesis that independent assessment of reality provided by a partner is an important factor underlying the efficacy of social support in reducing conformity. (21 ref.)—*Journal abstract*.

1103. Ashmore, Richard D. (U. California, Los Angeles) **Intergroup contact as a prejudice-reduction technique: An experimental examination of the shared-coping approach and four alternative explanations**. *Dissertation Abstracts International*, 1970(Nov), Vol. 31(5-B), 2949-2950.

1104. Belovicz, Meyer W., Finch, Frederic E., Pruitt, Dean G., & Teger, Allan I. (U. Massachusetts) **Comments on "The risky shift in group betting"**. *Journal of Experimental Social Psychology*, 1971(Jan), Vol. 7(1), 81-86.—Argues that D. G. Pruitt and A. T. Teger (see PA, Vol. 43:15712) included a methodological defect in their attempt to extend the generality of the risky shift to group betting, and that "the operational definition of probability used by them is not a measure of probability." A reply by Pruitt and Teger follows in which they review their methodology and give support for their conclusions. They note that the term "probability preference," questioned by Belovicz and Finch, could more appropriately be labeled "odds preference."—*M. West*.

1105. Ference, Thomas P. (Columbia U.) **Feedback and conflict as determinants of influence**. *Journal of Experimental Social Psychology*, 1971(Jan), Vol. 7(1), 1-16.—Asked 60 undergraduates to make a series of 20 judgments on the qualifications of applicants for college admissions. Ss' judgments were based on information provided by 2 sources. The analysis focused on differences in the influence of the sources, resulting from varying levels of conflict in the information provided and from the feedback on the accuracy of the judgments given to the S after each trial. Ss based their judgments on the content of the information when conflict was mild and on a choice between sources when conflict was strong; also, judgments based on a choice between sources were less intense. Feedback was found to determine the preference for sources although results were less clear-cut than expected. (18 ref.) *Journal abstract*.

1106. Hamilton, David L. (Yale U.) **The structure of personality judgments: Comments on Kuusinen's paper and further evidence**. *Scandinavian Journal of Psychology*, 1970, Vol. 11(4), 261-265.—Challenges the conclusions of J. Kuusinen (see PA, Vol. 43:12993) based on a comparison of the factor structures of individual Ss' ratings of their peers with the structure of peer ratings made by a group of Ss. He concluded that the group structure adequately represented the individual structures and that interindividual differences were unimportant. It is argued that the between-S differences in Kuusinen's results were too pronounced to be dismissed as negligible. Data are presented from a study in which 9 male undergraduates made personality ratings of stereotypic role figures. The factor structure underlying each S's ratings was determined and compared with that of each other S. The degree of congruence between the factor structures of pairs of Ss varied and in general only moderate convergence was observed. Implications of these individual differences for the concept of implicit personality theories are discussed.—*Journal abstract*.

1107. H6weler, Marijke & Vrolijk, Arle. (Free U., Amsterdam, Netherlands) **Verbal communication**

length as an index of interpersonal attraction. *Acta Psychologica, Amsterdam*, 1970(Dec), Vol. 34(4), 511-515.—Tested the hypotheses that (a) one's attitude is reflected in length of speech, and (b) both sexes show a more extensive verbal output when talking to a male. 40 male and 40 female undergraduates were asked by a male or female E to write a "spoken letter" to someone they liked and disliked. Both hypotheses were confirmed.—S. Knapp.

1108. Rubin, Jeffrey. (Tufts U.) **The nature and success of influence attempts in a four-party bargaining relationship.** *Journal of Experimental Social Psychology*, 1971(Jan), Vol. 7(1), 17-35.—Analyzed the functioning of a complex 4-party bargaining system in an experiment with 192 female undergraduates. 2 of the bargaining parties, A and B, were defined as having equal power, this power being greater than that of A and B's respective allies, X and Y—who also had equal power. The bargaining system was further structured to make it desirable for A and B to interact indirectly with each other, via X and Y as intermediaries. Within this paradigm, A and B's relationship with each other (cooperative vs. competitive) and X and Y's counterpower vis-à-vis A and B (high vs. low) were manipulated in a 2×2 factorial design. It was found, as predicted, that the system functioned most effectively (in terms of outcome levels and degree of positive affect among the 4 parties) when A and B were cooperatively oriented, and X and Y had low counterpower. The system functioned least effectively when A and B were competitive and their allies' counterpower was high. Unexpected findings emerged, however, with respect to the kinds of influence attempts directed by A and B at X and Y. Among the more provocative of these was the fact that cooperative As and Bs, in contrast with those receiving a competitive induction, made the most frequent use not only of promises but also of threats.—*Journal abstract.*

Social Perception & Motivation

1109. Argyle, Michael & McHenry, Robert. (Oxford U., England) **Do spectacles really affect judgments of intelligence?** *British Journal of Social & Clinical Psychology*, 1971(Feb), Vol. 10(1), 27-29.—Made video tapes of performers with and without spectacles, seen either static for 15 sec. or being interviewed for 5 min. Judges (30 undergraduates) rated IQs of performers as 12 points higher when they were seen wearing spectacles and were seen briefly; when the performers were seen for 5 min., however, spectacles made no difference. It is argued that this result throws doubt on experiments in person perception using photographs or brief exposure.—*Journal abstract.*

1111. Daves, Walter F. & Griffin, Julia W. (Georgia State U.) **Context effects in person perception as a function of dogmatism.** *Perceptual & Motor Skills*, 1970(Dec), Vol. 31(3), 927-932.—Investigated the role of dogmatism in context effects in the judgment of the personality dimension tense-relaxed. 48 undergraduates were selected on the basis of their scores on the Rokeach Dogmatism Scale. 4 Ss were assigned to each cell of the $2 \times 3 \times 2$ experimental design, which included sex of S, level of dogmatism, and nature of the 6 anchor

photographs (tense or relaxed) which preceded the test photographs. Ss then judged 6 neutral test photographs of adult males. The neutral photos were judged to be more relaxed when preceded by the tense anchors and more tense when preceded by the relaxed anchors. Dogmatism was not a significant source of variance. Female Ss tended to respond more strongly to the tense anchor and to judge the neutral photos as being more relaxed than male Ss. (20 ref.)—*Journal abstract.*

1112. Doise, Willem & Zavalloni, Marisa. (Ecole Pratique des Hautes Etudes, Paris, France) **The generality of social perception characteristics.** *Acta Psychologica, Amsterdam*, 1970(Dec), Vol. 34(4), 521-524.—Conducted an experiment to determine if cognitive style is a general characteristic of personality. 20 male and 29 female French undergraduates were asked to complete 3 questionnaires which presented triads of familiar persons, famous people, and nations. Ss were to indicate which 2 were alike and how they differed from the 3rd. Ss reacted consistently in categorizing the different social stimuli. It is concluded that categorization style may be regarded "as a generalized tendency or even as a personality trait."—S. Knapp.

1113. Edwards, John D. & Ostrom, Thomas M. (Loyola U., Chicago, Ill.) **Cognitive structure of neutral attitudes.** *Journal of Experimental Social Psychology*, 1971(Jan), Vol. 7(1), 36-47.—Having either all neutral experiences with an attitude object, or a wide range of positive, neutral, and negative experiences can produce overall affective neutrality, but these 2 types of experience should have different consequences for cognitive structure. An experiment is described in which 42 undergraduates formed attitudes about 2 hypothetical persons and responded to 2 single-score measures of attitude and a measure of cognitive structure. Manipulation of the evaluative homogeneity (all neutral vs. positive, neutral, and negative) of information about the attitude object shows that the evaluative profile of cognitive structure was significantly influenced by homogeneity. However, the effects of this variable were not detectable using single-score measures of attitude.—*Journal abstract.*

1115. Foster, Jeremy J. (Bolton Inst. of Technology, England) **Note on perceived personality of a nude.** *Perceptual & Motor Skills*, 1970(Dec), Vol. 31(3), 941-942.—Reports a pilot study of the effect of the nudity of a stimulus person (SP) on the personality characteristics ascribed to him. Separate subgroups of 18 male and 18 female students rated either the face only or the whole torso of underclothed and nude SPs on semantic differential scales and made judgments as to social class and intelligence. For female Ss, the nude female SP was rated higher on activity and potency and lower on evaluation by Ss who saw the whole torso. The nude SPs of both sexes were placed in a lower social class by the torso groups than the face groups, while male SPs were seen as less intelligent.—*Journal abstract.*

1116. Gozali, Joav & Sloan, Jack. (U. Wisconsin Milwaukee) **Reflections of the categorization of human excellence.** *Journal of Psychology*, 1971(Mar), Vol. 77(2), 207-211.—Attempted to identify the relationship between individual selection of important

persons and conformity, and to identify the relationship between frequency of selection and rank order weight frequency. 48 undergraduate students were asked to "list and rank order the 10 most important persons in the history of mankind," and to complete the Internal-External Control Scale. Significant correlations were found which suggest that conformity is an important factor in the selection of important persons. Also, data strongly suggest that the technique employed is a sensitive and reliable instrument.—*Author abstract.*

1117. **Griffitt, William & Jackson, Thomas.** (Kansas State U.) **Context effects in impression formation as a function of context source.** *Psychonomic Science*, 1970(Sep), Vol. 20(6), 321-322.—Obtained assimilation effects from 32 undergraduates when contextual stimuli and test stimuli were attributed to the same target person. A weak tendency toward contrast effects was noted when contextual stimuli and test stimuli were attributed to separate individuals.—*Journal abstract.*

1118. **Hartnett, John J.** (Virginia Commonwealth U.) **Group risk taking and constituency power.** *Journal of Psychology*, 1971(Mar), Vol. 77(2), 273-278.—180 male undergraduates were randomly assigned to 1 of 3 conditions. Each condition consisted of 154 man groups. Ss made individual and then unanimous group decisions that involved risk, with the belief that they could come back for a 2nd session. The decisions involved answering questions correctly for money, with more difficult questions paying more money. Ss in Condition I were told the decisions would affect only themselves. Ss in Condition II were told they were deciding for themselves and for 4 other students. Ss in Condition III were also assigned constituents but were told that the constituents had decision power as to whether the group could come back as decision makers for a 2nd session. A significant conservative shift ($p < .02$) was found in Condition III indicating that the power of constituents affects group risk taking.—*Author abstract.*

1119. **Hendrick, Clyde & Page, Horace A.** (Kent State U.) **Self-esteem, attitude similarity, and attraction.** *Journal of Personality*, 1970(Dec), Vol. 38(4), 588-601.—Ss evaluated 3 stimulus persons on several rating scales who were either 10, 50, or 90% similar to themselves in attitudes. Ss were divided into low, moderate, and high self-esteem groups on the basis of an earlier Q sort. Results indicate a strong positive relation between perceived similarity and positive attribution for each of the dependent variables, including liking, sophisticated, intelligent, sincere, happy, and a social distance scale. A negative relation was obtained for 2 undesirable traits: arrogant, and cynical. (18 ref) —*Journal summary.*

1120. **Johnson, Michael P. & Ewens, William.** (U. Michigan) **Power relations and affective style as determinants of confidence in impression formation in a game situation.** *Journal of Experimental Social Psychology*, 1971(Jan), Vol. 7(1), 98-110.—In an experiment with 88 undergraduates 3 hypotheses were tested concerning confidence in impression formation: (a) individuals in a situation in which another person has power over them are more confident of their impressions of him than are those in a situation in which the other person has no power over them, (b) individuals in a situation in which they assume that the other person believes that he has power over them are more confident of their impressions than those who assume that the other person believes that he has no power over them,

and (c) individuals who score high on the Ehrlich-Lipsey Affective Style scale are more confident of their impressions of the other person than those who score low. These hypotheses were strongly confirmed in a 2-person, non-zero-sum game situation. Results support the need to introduce motivational variables into theories of person perception. Several theoretical formulations are presented.—*Journal abstract.*

1121. **Jones, Edward E., Worchel, Stephen; Goethals, George R., & Grunet, Judy F.** (Duke U.) **Prior expectancy and behavioral extremity as determinants of attitude attribution.** *Journal of Experimental Social Psychology*, 1971(Jan), Vol. 7(1), 59-80.—Instructed 224 undergraduates in an experiment on attitude attribution, to estimate the "true attitude" of a target person after reading an essay in which he took 1 or the other side of a controversial issue. 4 independent variables were manipulated: the direction of the essay (pro vs. antilegalization); its extremity (strong vs. weak); freedom to choose position vs. assignment to position (choice vs. no choice); and prior expectancy (expect pro vs. expect anti). All experimental predictions were confirmed by results. When the essay was strong: (a) attitudes were attributed more in line with behavior under choice than under no choice conditions; (b) even under no choice conditions, the target person was seen as believing to some extent in the arguments of his essay; and (c) the role of choice was especially prominent when the position of the essay was unexpected. As in previous experiments, there was considerable variability in those conditions in which the target person wrote an essay under no choice instructions endorsing the position he presumably opposed. In attempting to determine what produced this variability, it was found that Ss with generalized expectancies of internal control were more sensitive to variations in choice than Ss whose expectancies were externalized.—*Journal abstract.*

1122. **Kreps, Juanita M.** (Women's Coll.) **Separation of work and income.** In F. F. Korten, S. W. Cook, & J. I. Lacey (Eds.), "Psychology and the problems of society." (See PA, Vol. 46 Issue 1) 140-151.

1123. **Leventhal, Gerald S. & Michaels, James W.** (Wayne State U.) **Locus of cause and equity motivation as determinants of reward allocation.** *Journal of Personality & Social Psychology*, 1971(Mar), Vol. 17(3), 229-235.—Investigated the influence of external and internal constraints on the assessment of inputs. 32 male Ss believed that they were recommending guidelines for rewarding participants in a future study of physical performance. Ss judged the extent to which 16 hypothetical individuals deserved to be rewarded for performance on a vertical jump task. For each individual Ss received information about jump performance, effort, body height and training. With performance held constant, individuals whose body height and training made them especially well qualified to perform at a high level were considered less deserving of reward than individuals whose height and training did not give them such an advantage. Individuals with high rather than low effort were considered more deserving even though their performance was similar.—*Journal abstract.*

1124. **Levin, Irwin P. & Schmidt, Charles F.** (I. Iowa) **A paired-comparisons paradigm for investigating person perceptions.** *Psychonomic Science*, 1970(Sep), Vol. 20(6), 359-361.—Presented 27 undergraduates with a series of pairs of person descriptions. Each person description consisted of 1 or more personality trait

adjectives. Within each pair of person descriptions, Ss had to choose the person he would most like to have as a friend and indicate how much he preferred that person over the other person in the pair. When a description consisted of several adjectives, it was suggested that Ss integrate the information through a weighted averaging process. Consistent with this notion, a reliable set size effect was obtained with positive-valued adjective sets; however, no reliable set size effect was obtained with negative adjectives. There was no evidence for discounting of inconsistent information when a pair of antonyms was included in the description of a given person.—*Journal abstract.*

1125. Lovie, A. D. & Davies, Ann D. (U. Liverpool, England) An application of Bayes' theorem to person perception: The effect of rate of revision and initial revision on the perception of another's age. *Acta Psychologica, Amsterdam*, 1970(Dec), Vol. 34(2-3), 322-327.—Considers the way in which estimates of age are revised as further information is presented and compares Ss' revisions with a Bayesian model. Lists of cue statements were constructed and 50 undergraduates considered whether the statements described a young, middle-aged, or old man. Each list favored 1 hypothesis. Lists were designed to investigate the effect on Ss' revisions, of Bayesian revision rate, and size of initial Bayesian revision. Ss were conservative in their revisions but their revision rates reflected the Bayesian model. The diagnostic impact of the initial item of information is discussed.—*Journal abstract.*

1126. Luginbuhl, James E. (North Carolina State U.) The effect of legitimacy of a request and compliance versus noncompliance on the evaluation of others. *Journal of Personality*, 1970(Dec), Vol. 38(4), 482-492.—80 male undergraduates read a supposedly true interaction between 2 workers in a business firm, in which A made a request of B. The status of B relative to A, the legitimacy of the request, and compliance vs. noncompliance by B were varied. It was found that (a) compliers to legitimate requests and noncompliers to illegitimate requests were liked better than noncompliers to legitimate requests or compliers to illegitimate requests, (b) noncompliers were seen as more internally controlled than compliers, and (c) individuals may respond to an atypical situation by imposing upon it a consistent internal structure. Status had little effect.—*Journal summary.*

1129. Partington, John T. & Clarke, Louise. (Brock U., Catharines, Ontario, Canada) Personality impression formation: A correlational-experimental design. *Canadian Journal of Behavioural Science*, 1971(Jan), Vol. 3(1), 47-54.—62 undergraduates rated how they would accept a number of hypothetical stimulus people represented by combinations of self-referent statements denoting opposite poles of 4 personality dimensions. Ss also gave self-endorsement responses to a personality battery which sampled the same 4 dimensions. Perceivers were classified into personality types defining levels of a

S's factor which together with 4 stimulus cue factors comprised a complete factorial design for analyzing the acceptance ratings. Although the main experimental results suggest that stimulus cue integration may be more linear than configural, the nature of S-cue interactions illustrates the need for more representative design in social perception research. 1131. Schützenberger, Marcel-Paul. Etude statistique d'un problème de sociométrie, réciprocité en sympathie et antipathie. [Statistical investigation of the problem of sociometry, reciprocity in sympathy and antipathy.] *International Journal of Sociometry & Sociatry*, 1968(Sep), Vol. 5(3-4), 125-132.—Attempts to formulate statistical treatment of certain aspects of sociometric inquiry, and presents an example of its application. 4 classes of students designated choices of a best friend, 4 best friends, and 3 classmates who were regarded with antipathy. An attempt was made to sociometrically determine the number of existing reciprocities in responses to the 3 questions. Results show that the antipathy choices do not become manifest in reciprocity to any less degree than do choices related to sympathies. Results are discussed in relation to the lack of theoretic value of the null hypothesis for estimation of population variance in determining reciprocity in sociometric status. (French summary)—B. A. Stanton.

1133. Sigall, Harold. (U. Rochester) Effects of competence and consensual validation on a communicator's liking for the audience. *Journal of Personality & Social Psychology*, 1970(Oct), Vol. 16(2), 251-258.—70 female undergraduates in a laboratory experiment presented a communication to an audience. Prior to the experiment all Ss had strongly endorsed the advocated position. S involvement in the persuasive attempt was varied: Ss were randomly assigned to high- or low-involvement conditions. The preprogrammed audience indicated either that they agreed, but changed only slightly in the advocated direction, or that they disagreed, but changed considerably in that direction. Ss then expressed their liking for the audience. On the basis of competence theory and consensual validation, it was predicted that under low involvement, the agreeing-small-change audience would be liked better than the disagreeing-large-change audience, while under high involvement, the reverse relationship would hold. Results support the hypothesis. The relationships between competence and consensual validation, and between effort and involvement, are discussed. (21 ref.)—*Journal abstract.*

1134. Strickland, Lee E. & Fruchter, Benjamin. (U. Texas) Nonredundant matrices in the determination of socioeconomic status. *International Journal of Sociometry & Sociatry*, 1968(Sep), Vol. 5(3-4), 117-124.—Modified the procedure developed by J. X. Jamrich for the analysis of status within sociogroups to eliminate redundant relationships, and extended it to include 3-stage relationships. In the analysis of status

within sociogroups, the 2-stage relationships a group member has with himself are considered redundant. Those 3-stage relationships which are extensions of the redundant 2-stage relationships are also considered to be redundant. An improved sociometric status index is proposed in which the status of a group member is the number of nonredundant 1-, 2-, or 3-stage inward relationships he has with the other group members.—*Journal abstract.*

1135. Tankard, James W. (U. Texas) **Effects of eye position on person perception.** *Perceptual & Motor Skills*, 1970(Dec), Vol. 31(3), 883-893.—Prepared black and white stimulus photographs of 6 models in 3 conditions: (a) looking straight into the camera, (b) looking downward, and (c) looking sideways. Photographs were shown to 48 undergraduates and young adults who were told to assume they were interviewing the models for jobs. Ss rated models on 15 semantic differential scales, a salary scale, and answered 4 brief questions on the model and nature of the experiment. Eye position influenced response to models. Significant differences were found for 11 of 16 scales in comparisons of straight and downward gazes and for 2 of 16 scales in comparisons of straight and sideways gazes. Results indicate that impressions of another person are influenced by changes in the position of the eyes even when the amount of eye movement is very small. (18 ref.)—*Journal abstract.*

(Indiana U., Audio-Visual Center) **Affection and cognition in transaction and the mapping of cultural space.** *AV Communication Review*, 1970(Win), Vol. 18(4), 440-445.—This is the 3rd and last in a series of articles in which an attempt is made "to conceptualize culture as the totality of sign behavior patterns" and culture mediation as the process involved in forming shared systems of sign behavior. In this article, a transactional relationship between affective and cognitive mental functions is stressed.—*Journal summary.*

Language

1140. Barrutia, Richard. (U. California, Irvine) **Visual phonetics.** *Modern Language Journal*, 1970(Nov), Vol. 54(7), 482-486.—Describes the creation and development of a complete visual scheme for the phonemic system of Spanish. The scheme is based on an idea from *Introductory Linguistics* by R. A. Hall which demonstrates a possible patterning of consonants by comparing box-like structures for English and Spanish in a prismatic construction. Alterations and expansions are suggested

through which the prismatic form for Spanish can become a powerful tool in teaching phonetics. Means of presenting the prismatic structure to a class are also suggested.—*S. Diamond.*

1141. Catford, J. C. & Pisoni, David B. (U. Michigan) **Auditory vs. articulatory training in exotic sounds.** *Modern Language Journal*, 1970(Nov), Vol. 54(7), 477-481.—2 groups of English speakers of 8 and 6 undergraduate students received either auditory or articulatory instruction in learning to produce exotic sounds. Performance on production and discrimination tests indicate a striking superiority for Ss who received systematic training in the production of exotic sounds as opposed to those Ss who received only discrimination training in listening to these sounds. Results suggest that what is effective in the teaching of sound production and discrimination is the systematic development by small steps from known articulatory postures and movements to new and unknown ones. The possession of a scientific knowledge of articulatory phonetics by the teacher was shown to be extremely successful in leading students to the correct production of foreign sounds and thereafter to facilitate the discrimination of these sounds. The latter finding was taken as support for some carryover from productive competence to auditory discriminatory competence.—*S. Diamond.*

1143. Foote, Russell. (U. Wyoming) **Homophones as ambiguous stimuli in research: A comparison of the associative meaning of homophones and non-homophones.** *Psychonomic Science*, 1970(Nov), Vol. 21(4), 249-251.—Presented 36 homophones and 36 nonhomophones randomly to 30 undergraduates in a single response, free association task. The greater dispersion of the response distributions to homophones than to nonhomophone stimuli as well as the longer response latencies to homophones suggest that the associative meaning of homophones is more ambiguous than other elements of the vocabulary and, consequently, that homophone units may be fruitfully employed in research necessitating the use of such ambiguous stimuli. Several such potential uses are discussed along with possible research aimed towards clarifying the phenomenon of homophones per se, apart from their use as research tools.—*Journal abstract.*

1144. Gill, Wayne S. & Hogan, Charles A. (2310 Tower Life Bldg., San Antonio, Tex.) **The effect of language upon gender shaping.** *International Journal of Symbolology*, 1970(Aug), Vol. 2(1), 9-12. In order to determine the effect of learning a 2nd language on gender shaping, 28 adult bilingual (Spanish-English) Ss were compared with a similar group of Ss who spoke only English. Each S was presented a list of 50 English nouns, both abstract and concrete, and asked to note whether he usually considered the noun to be masculine or feminine. The analysis of results consisted of computing "t" score values for both masculine and feminine words on the 2 S groups. The results showed no significant difference between the means of either the masculine or feminine words.—*Journal abstract.*

1145. Gumenik, William E. & Dolinsky, Richard. (U. Toledo) **Effect of verb and object meaning on the connotative evaluation of sentence subjects.** *Journal of Experimental Psychology*, 1971(Mar), Vol. 87(3),

436-438.—Reports that in a previous experiment by W. E. Gumenik and R. Dolinsky (see PA, Vol. 44:2287), CVCs used as sentence subjects were rated good when verb and object had similar, and bad when they had opposite, evaluative meaning. In line with a congruity principle explanation, it was held that good verbs acted as associative and bad verbs as dissociative bonds between sentence subject and object. To determine whether verbs had further effects on the evaluative meaning of the subject, an experiment was conducted with 35 undergraduates using neutral and understood (omitted) objects. With good verbs, CVC subjects were rated good, irrespective of whether the objects were good, neutral, or understood and were rated bad if the objects were bad. With bad verbs, the ratings were reversed. Apparently, the role of verbs is greater than being a bond between sentence subject and object.—*Journal abstract.*

1146. Harvey, Pierre. *Nous sommes tous des sous-développés.* [We are all the underdeveloped.] *Interprétation*, 1970(Jul), Vol. 4(3), 85-96.—In approaching the problem of language in relation to economic issues, the English language is seen as dominating the economic life of the Western world. The causes of this phenomenon are traced from its being the language of economic life (dominated by England) during the Industrial Revolution of the 19th century. In the 2nd 1/2 of the 19th century and beginning of the 20th liberal capitalism was 1st and foremost English, with invention of the new economic-social language consequently in English. With World War I economic superiority passed to the United States, giving still further penetrating power to the English language as it adapted to the requirements of technological change and the appearance of new scientific administrative management techniques. The new technology, as symbolized by the computer, spread throughout the world by the United States, imposes upon its users the language of the country originating it, a language foreign to the nations employing the American technology. Many nations, e.g., France and Sweden, can assimilate the new national language, English, with workers making their living in the new language while daily life continues in the language of the country—a situation which does not hold true, however, in French Canada.—*T. N. Webster.*

1147. Holt, Herbert. *Is psychoanalytic language obsolete?* *Journal of Contemporary Psychotherapy*, 1970(Sum), Vol. 3(1), 35-40.—Proposes that the sickness of present society is due to the overwhelming emphasis on cerebral activity. 2 methods of communication are distinguished and described: myth and discursive language. Discursive language is seen as being limited to the objective, the general, and the logical, whereas mythical language, the subjective, emotional, and imaginative, is seen as embodying an eternal truth. "Horizontal or lateral thinking (mythology) is more popular and more useful today, especially since the basic, mathematical vertical thinking (discursive) can often be done more effectively by computers than man." The reappearance of mythological thinking is described as an attempt to break the rigid image of reality which discursive thinking has created so that new ideas may emerge. A dynamic tension between the 2 forms of communication is considered essential for insight. Psychoanalytic language is presented as vertical thinking that has become almost totally obsolete. It is recommended that in existential psychiatry the language "must be concrete, subjective,

and mythical, and must be the language of the person with whom the work is being done and a language that must be shared."—*S. Knapp.*

1148. Lanteri-Laura, G. & Philippi, J. D. (U Strasbourg, France) *Lapsus et paraphrases sémantiques: Conceptions neurophysiologiques et psychopathologiques.* [Semantic lapses and paraphrases: Neurophysiological and psychopathological conceptions.] *Bulletin de Psychologie*, 1969-1970, Vol. 23(4-5), 283-289. Discusses cases of lapses and paraphrases and attempts to develop a model of their underlying mechanisms. Lapses are considered phonological selections related to a binary model, synaptic functions, and as having neurophysiological bases. Paraphrases are believed to be of psychopathological origin, serving the conflict between behavior and internal wishes, while lapses are considered to be involuntary, occurring in spontaneous speech, and serving to obscure message transmission.—*R. E. Smith.*

1149. Ludwig, David J. (Concordia Senior Coll.) *The effect of language upon gender shaping: A rejoinder to W. S. Gill and C. Hogan.* *International Journal of Symbolology*, 1970(Aug), Vol. 2(1), 13.—W. S. Gill and C. Hogan (see PA, Vol. 45:Issue 6) attempted to replicate a study performed by Ludwig & Moore (1969). The suggestion is made that the negative results "cast considerable doubt" on the previous study.—*Journal abstract.*

1150. Rao, T. S. (National Inst. of Education, New Delhi, India) *Bilingualism and adjustment difficulties.* *Indian Educational Review*, 1969(Jan), Vol. 4(1), 57-66.—Investigated 2 hypotheses regarding monolingual bilingual children: that they show relatively more problem behaviors than monoglots and to that extent are maladjusted; and that the degree of maladjustment is related to their 2nd-language attainment. The sample was comprised of 226 6-10 yr. olds, with Kannada or Telugu as their mother-tongue, drawn from the 1st 5 classes of 30 primary Tamil-medium schools of Madras. Relevant information about the Ss was sought from the teachers through an inventory covering school situations and from the parents through another inventory covering home situations. For the 1st hypothesis, a control group of children with Tamil as their mother-tongue, matched for intelligence, was used. The 2nd-language attainment of the sample was judged by measuring 4 language skills. Results support the 1st hypothesis partially, but not the 2nd.—*Journal abstract.*

1151. Taylor, Kent B. (George Washington U.) *An information-theory measurement of CVC trigram meaningfulness.* *Psychonomic Science*, 1970(Oct), Vol. 21(2), 101-103.—Examined the validity of the approach to measuring the meaningfulness of nonsense syllables in terms of Ss' ratings and use of associations and pronounceability. The redundancy of nonsense syllables was quantified by means of their component transitional probabilities, using information-theory measurements. These mathematically derived ratings were in agreement with Ss' ratings of association value and pronounceability used by previous investigators to identify the relative meaningfulness of CVC trigrams. It is hypothesized that the redundancy measures, by measuring the amount of structure in trigrams, are indicative of the potentiality for yielding signification meaning in short verbal units.—*Journal abstract.*

1152. Wexler, Kenneth N. (Stanford U.) *An automaton analysis of the learning of a miniature system*

121

Canadian Journal of Behavioural Science, 1971(Jan), Vol. 3(1), 11-17.—184 undergraduates each responded to the California F Scale, a reversed F Scale, and rated the item pairs on the degree the original item was contradicted by its reversal. Correlations across items indicate a negative relationship between the contradictoriness scale value obtained from the group for each item pair and the number of double agreements given each item pair by the group. Further analysis of data indicates that each S tended to give double agreements when his ratings indicated the reversal basically contradicted the original item. Thus this type of correlation across items can no longer be taken as evidence that Ss give double agreements when the original item is not contradicted by its reversal. (French summary)—*Journal abstract*.

1167. Lester, David. (Suicide Prevention & Crisis Service, Buffalo, N.Y.) **Relation of fear of death in subjects to fear of death in their parents.** *Psychological Record*, 1970(Fal), Vol. 20(4), 541-543.—Compared the fears of death of female undergraduates to those of their parents, and found that the fears of death of daughters significantly resembled those of their mothers, but not of their fathers. Ss and their parents were evaluated by their responses to L. J. Collett's and D. Lester's fear of death scale. Implications of results for understanding the development of fears of death are discussed.—*Journal abstract*.

1168. Montserrat-Estève, Santiago. (Clínica Médica Universitaria, Barcelona, Spain) **Egostasis.** [Egostasis.] *Anuario de Psicología*, 1969, Vol. 1, 45-55.—Discusses the different meanings and implications that ego offers in psychology, noting that recent advances in experimental psychology necessitate a new ego concept. The processes of homeostatis (self-regulating system of biological balance) and sensoriostatis-perceptostatis (a self-regulating system for equilibrium with the world) are elaborated, and the concept of egostasis is introduced. The function of egostatis is perceived as maintaining an equilibrium between the corporal ego (under homostatic regulation) and the psychological ego (under sensoriostatic regulation) so as to keep the personal ego in a dynamic state of constant flux. The hypothesis of egostatis is discussed in relation to information theory and H. Frank's "Informationspsychologie."—P. Hertzberg.

1169. Rump, E. E. & Court, John. (U. Adelaide, South Australia) **The Eysenck Personality Inventory and Social Desirability response set with student and clinical groups.** *British Journal of Social & Clinical Psychology*, 1971(Feb), Vol. 10(1), 42-54.—Administered the Eysenck Personality Inventory (EPI) to 3 student-groups and to 2 clinical groups in studies to investigate Social Desirability (D) effects. Form A of the EPI and the EPPS D scale were completed by 100 students; Form A and the Marlowe-Crowne Social Desirability (D) scale by 177 students; Form B and the Marlowe-Crowne D scale by 175 students; and Form A, including the Lie (L) scale, by 38 potential renal transplant patients and 15 potential renal donors. Negative linear correlations between the Neuroticism (N) scale and the D or L scales were found for all groups. A very pronounced reduction in N scores was found with potential renal donors, together with high L scores. In most cases, no reliable

correlation between Extraversion (E) and the D or L scales was found. The N and E scales were correlated negatively for Form B. Implications of these results for the use of the EPI are considered. Correlations with age and IQ were also obtained. (31 ref.)—*Journal abstract*.

Behavior Correlates

1170. Anast, Philip. (Eastern Washington State Coll.) **Blaming the nation: Fad or maturity?** *Journalism Quarterly*, 1969(Fal), Vol. 46(3), 552-557.—Intro-extrapunitiveness expressed as a tendency to blame the United States or foreign powers for current and recent international problems was measured by a summated scale. It was predicted that intro-punitiveness would correlate with certain measures of maturity, provided by a questionnaire answered by 314 respondents of a nonprobability sample. The hypothesis was supported by significant correlations between the tendency to blame the nation and cognitive complexity, academic rank, amount of time devoted daily to news-seeking behavior, altruistic attitude toward work in the Peace Corps and Volunteers in Service to America, and interest in foreign affairs.—J. A. Kline.

1179. **Prężyna, Władysław.** **Postawa religijna a cechy osobowości analizowanej w świetle danych 16-czynnikowego kwestionariusza R. B. Cattella.** [Religious attitudes and personality traits analyzed on the basis of the data supplied by R. B. Cattell's 16-factor questionnaire.] *Roczniki Filozoficzne: Annales de Philosophie*, 1969, Vol. 17(4), 99-124.—Investigated the relationship between the religious attitudes and personality characteristics. The religious attitude scale applied in this study was constructed by the author. Personality was investigated with the 16 PF in its Polish version standardized on Polish population. The sample consisted of 60 women and 40 men. Results reveal the high positive religious intensity group to possess on the average more emotional maturity, more super-ego control, greater self-control, higher sensitivity and contact with the environment. The lower intensity group was characterized by the opposite features. (English summary)—*J. Holowinsky.*

1180. **Vando, Alan.** (Columbia U.) **A personality dimension related to pain tolerance.** *Dissertation Abstracts International*, 1970(Oct), Vol. 31(4-B), 2292-2293.

1181. **Weikert, Clemens.** (Lund U., Sweden) **Detection of target cues as related to spiral after-effect duration.** *Psychological Research Bulletin, Lund U.*, 1970, Vol. 10(8), 11 p.—Studied the relationship between personality in terms of spiral aftereffect (SAE) duration and the ability to detect target cues. 69 Swedish soldiers served as Ss. Results indicate that Ss with short aftereffect duration in the final scores of a series of 10 SAE trials performed better on the detection task than Ss with long aftereffect duration. Effects of differences in training level and motivation are discussed.—*Journal abstract.*

1182. **Williams, Jean M., Hoepner, Barbara J., Moody, Dorothy L., & Ogilvie, Bruce C.** **Personality traits of champion level female fencers.** *Research Quarterly*, 1970(Oct), Vol. 41(3), 446-453.—Studied 30 national level female fencers with the 16 PF and the national level female fencers with the 16 PF and the EPPS to determine if there were distinct personality traits characteristic of champion level female fencers, and if there was any correlation between personality traits and level of achievement in the 1968 National Championship. A definite fencer's personality emerged when they were compared with the national norms. In general, the competitive fencer may be described as a very reserved, self-sufficient, autonomous individual with a below-average desire for affiliation and nurturance. She has a strong need to be the very best and

is an intelligent, creative, experimenting, and imaginative person. She also tends to be assertive and aggressive. An analysis of variance revealed that only 1 personality factor would differentiate levels of achievement. The top level competitor was significantly more dominating than the low level competitor. (19 ref.)—*Journal abstract.*

INTELLIGENCE

1183. **Bottenberg, E. H.** (U. Würzburg, Inst. of Psychology, W. Germany) **Kognitive Attitüden und Intelligenz.** [Cognitive attitudes and intelligence.] *Psychologische Beiträge*, 1970, Vol. 12(3), 415-446.—Factor-analyzed intelligence and additional cognitive functions to determine the relationship between cognitive attitudes and intelligence variables of cognitive attitudes. 117 students were tested. The investigation yielded 5 factors that can be interpreted: (a) field articulation, (b) linear type of cognition, (c) flexible vs. constricting control, (d) concrete vs. abstract conception, and (e) velocity of determined meaning replenishing. The factors a, b, and c overlapped variables of cognitive attitudes and intelligence variables. Factor d was limited to cognitive functions. Factor e was relevant to a single cognitive function and intelligence variables. The scheme of dimensions developed in the field of cognitive attitudes and intelligence is discussed. (6 p. ref.)—*English summary.*

1184. **Maxwell, James.** (Scottish Council for Research in Education, Edinburgh, Scotland) **Intelligence, education and fertility: A comparison between the 1932 and 1947 Scottish surveys.** *Journal of Biosocial Science*, 1969(Jul), Vol. 1(3), 247-271.—In 1932 all 11-yr-old children in Scottish schools were given a group intelligence test, and a sample of 1000 individually tested. Future careers of this sample were followed until 1939. In 1968, 709 of the original sample were traced, and data about education, employment, and family obtained. In 1947, a parallel survey was conducted and 1208 children individually tested and followed up for 16 yr. Similar data were obtained for the 1947 sample. A comparison between length of education indicates a greater proportion completing a full secondary education in the 1947 than in the 1932 sample. Proportionally, more of the 1947 sample graduated from university. In marriage, it was possible to cut across the 1932 sample at the age of 27 yr., to make direct comparison with the 1947 sample at the same age. The greatest incidence of marriage was in the middle range of IQ, but later records for the 1932 sample show a relative uniformity of marriage over the IQ range. The pattern for occupational class was similar. 2 measures of differential fertility for IQ were used. For both samples, there was a negative relationship between the mean IQs of the sample members and the number of their sibs, more marked for the 1947 sample. The number of children born to members of the 2 samples before the age of 27 shows a similar relationship, but in the following 20 yr., the pattern for the 1932 sample changed to 1 with a peak of mean IQ at 2 children. It is suggested that linear differential fertility for IQ may be a function of the age of the parent.—*Journal summary.*

1185. **McKeown, Thomas.** (U. Birmingham, England) **Prenatal and early postnatal influences on measured intelligence.** *British Medical Journal*, 1970(Jul), Vol. 3(5714), 63-67.—Examines possible explanations for pregnancy duration beyond the maximal rate of fetal

growth. Conclusions are based on comparison of pre- and postnatal growth rates. The lengthening of pregnancy may be related to the selective advantages of maturity at birth, particularly, in man, the development of immunity to infectious disease. Verbal reasoning scores recorded in the 11-plus examination provide no evidence that the retarded prenatal growth associated with prolongation of gestation affects measured intelligence. There are considerable score differences in a general population of births in relation to birth weight and duration of gestation; but, like the larger differences related to maternal age and order of birth, they are not found in sibs. It was also found that twins raised singly from birth have scores higher than twins raised together, and little lower than those of single births. This indicates that even the pronounced retardation of fetal growth which occurs in twin pregnancy has little effect on verbal reasoning, the large differences between twins and single births being due to postnatal experience.—*Journal abstract.*

1186. **Schmideberg, Melitta.** (Assn. for Psychiatric Treatment of Offenders, London, England) **The socio-psychological impact of IQ tests.** *International Journal of Offender Therapy*, 1970, Vol. 14(2), 91-97. —Examines the influence that IQ tests have had on the mentality of 2 generations. Since the tests were developed by and for the middle classes, they discriminate against the non-educated, the lower classes, those from minority groups, and those from different social and national groups. The assumption of constant, i.e., unchangeable, basic intelligence is seen as defeatist, having a positive and negative effect on the self-concept out of proportion to the level of validity of the tests. CREATIVITY

1187. **Bader, Lawrence J.** (Boston U., Graduate School) **The effects of task-taking atmosphere, level of creativity and field-independence on creative production.** *Dissertation Abstracts International*, 1970(Nov), Vol. 31(5-B), 2974-2975.

1188. **Bliss, William D.** (Montana State U.) **Birth order of creative writers.** *Journal of Individual Psychology*, 1970(Nov), Vol. 26(2), 200-202. —Compares birth-order data of 39 writers and 25 poets with Roe's eminent scientists and finds that the literary group holds a lower birth-order position.—*A. R. Howard.*

1189. **Calvi, G.** **La natura e i limiti della creatività nevrotica.** [The nature and limits of neurotic creativity.] *Archivio di Psicologia, Neurologia e Psichiatria*, 1969(Jan), Vol. 30(1), 17-35. —On the basis of the life of Antoine Rodondi, a French painter born of Italian parents, creativity is considered on a dimension ranging from organization to disorganization intersecting another dimension ranging from rigidity to ideological mobility. Within the limits of both dimensions 2 dependent variables are inversely related, effective mobility under the direction of intentionality and apparent mobility resulting from habits.—*L. L'Abate.*

1190. **Harris, Richard & Hall, Alfred E.** (U. Illinois) **Creativity and the need for associative novelty.** *Canadian Journal of Psychology*, 1970(Apr), Vol. 24(2), 90-97. —Based on J. P. Houston and S. A. Mednick's experiment (see PA, Vol. 37:6699), the differential reinforcing properties of associative novelty were assessed for high-creative and low-creative Ss. 80

undergraduates, the top and bottom 26% of a pool of 156 Ss who had taken the Remote Associates Test (RAT), participated in a 2x4 factorial experiment. The independent variables were creativity, measured by the RAT, and type of reinforcement of nouns; the dependent variable was the number of nouns chosen over blocks of 40 trials. Each S saw 180 cards with 2 words, a noun and a nonnoun, typed on each card. If S chose the nonnoun, E responded with its most common associate. If S chose the noun, E responded with a very common associate, a moderately common associate, a very uncommon associate, or a similar-sounding word, depending on the experimental condition. Neither main effect of creativity nor type of reinforcement was significant ($p > .05$); only the effect of trials was significant ($p < .01$). Hence, the main findings of Houston and Mednick were not replicated. Such results may have been due to the nature of the task which was perceived by the Ss as a multidimensional concept-identification task with many irrelevant aspects to divert S's attention from the relevant features of the experiment. (French summary)—*Journal abstract.*

1191. **Kogan, Nathan.** (New School for Social Research) **A clarification of Cropley and Maslany's analysis of the Wallach-Kogan creativity tests.** *British Journal of Psychology*, 1971(Feb), Vol. 62(1), 113-117. —Attributes the conclusion of A. J. Cropley and G. W. Maslany (see PA, Vol. 44:2349), that complete statistical independence had not been established for intelligence and creativity in the Wallach-Kogan creativity tasks, to a failure to rotate. A promax rotation of the Cropley-Maslany principal-components solution is reported. Such rotation yields a pure creativity factor and 2 intelligence factors. Unlike the Cropley-Maslany principal-axis factor loadings, the promax solution is congruent with most of the evidence reported in other relevant investigations of the creativity-intelligence distinction. (18 ref.)—*Journal abstract.*

PERSONALITY MEASUREMENT

London, Inst. of Psychiatry, England) **A factor-analytic study of the Barron-Welsh Art Scale.** *Psychological Record*, 1970(Fal), Vol. 20(4), 523-525. —Conducted a factor analysis on the 86 items of the Barron-Welsh Art Scale, using 111 male students as Ss. 4 almost entirely independent factors were found, all of which could be interpreted with some confidence.—*Journal abstract.*

1194. **Frick, Willard B.** (U. Michigan) **A holistic theory of healthy personality.** *Dissertation Abstracts International*, 1970(Nov), Vol. 31(5-B), 2982-2983.

1195. **Gilis, John S. & Kinsella, Noel A.** (St. Thomas U., Fredericton, New Brunswick, Canada) **Some personality factors of matched groups of New Brunswick blacks and whites.** *Canadian Journal of Behavioural Science*, 1971(Jan), Vol. 3(1), 66-71. —Randomly matched groups of 14 blacks and 14 whites from the same high school completed Form C of the 16 PF under the joint supervision of 2 test administrators. 1 white and 1 black. Group differences were found on 2 of

the 16 factors: A (.01) and Q2 (.01). An illustration is given of the inapplicability of knowledge of the group differences to decision making about individuals. (French summary)—*Journal abstract*.

1196. Hendricks, Moana; Guilford, J. P., & Hoepfner, Ralph. (U. Southern California, Psychological Lab.) **Measuring creative social intelligence.** *Reports from the Psychological Laboratory, University of Southern California*, 1969(Jan), No. 42, 36 p.—Focuses on the aspect of social intelligence pertaining to coping with other persons. In terms of structure-of-intellect theory, this area includes the 6 behavioral-divergent-production abilities (DBX), which have to do with the generation of behavioral ideas in quantity and variety. 22 new tests were designed to measure these 6 DBX abilities. To determine the distinctness of these hypothesized abilities from both behavioral-cognition abilities and semantic-divergent-production abilities, 3 of the former and 4 of the latter were also represented by tests in the analysis, plus the ability cognition of semantic unit (verbal comprehension), to represent the verbal IQ. Analysis showed that the DBX abilities could be demonstrated as distinct from one another, from behavioral-cognition abilities, from semantic-production abilities, and presumably from IQ. (24 ref.)—*Journal summary*.

1197. Jackson, Russell H., Manaugh, Thomas S., Wiens, Arthur N., & Matarazzo, Joseph D. (U. Oregon, Medical School) **A method for assessing the saliency level of areas in a person's current life situation.** *Journal of Clinical Psychology*, 1971(Jan), Vol. 27(1), 32-39.—It was hypothesized that salient content might be reflected in how a person speaks. A Topic Importance Scale (TIS) was developed to measure specific but relatively independent topics of high, moderate, or low importance (saliency) in the current life situation of college students. 348 male and 232 female Ss ranked each of the 45 topics of the TIS along a scale from 1-7 for each of 4 subdivisions: interest, information, involvement, and strength of feeling. A high level of reliability was noted. Saliency level did not represent a single, unitary dimension. Partial evidence of the validity of the TIS was noted. The methodology used was noted as having applicability to the study of psychological states.—*E. J. Kronenberger*.

1198. Kamen, Gary B. (U. Missouri, Columbia) **The effects of a stress producing film on the test performance of adults.** *Dissertation Abstracts International*, 1970(Nov), Vol. 31(5-B), 2989.

1199. Nowakowska, Maria. (Polish Academy of Sciences, Inst. of Praxiology, Warsaw) **A model of answering to a questionnaire item.** *Acta Psychologica, Amsterdam*, 1970(Dec), Vol. 34(4), 420-439.—Presents a model of answering to questionnaire items, which could serve as a basis for construction of a computer program for simulating the process of answering, with the requirement that the input data should correspond to empirically measurable parameters of items. 56 psychology students answered questions on the 16 PF and then rated the question and their answers on a 17-item evaluation scale. Factor analysis based on information coefficients yielded 7 factors: (a) emotional and motivational attitude, (b) specific past experience, (c) intellectual evaluation of question and answer, (d) value of question, (e) social desirability, (f) specific emotional context, and (g) frequency of behaviors. Results are presented in the form of a model of answering to the questionnaire items. This model assumes both the

content-dependent and content-independent determinants of the answer. (18 ref.)—*Journal abstract*.

1200. Ray, John J. (Macquarie U., North Ryde, New South Wales, Australia) **The development and validation of a balanced Dogmatism scale.** *Australian Journal of Psychology*, 1970(Dec), Vol. 22(3), 253-260.—Produced a balanced Dogmatism Scale by writing entirely new items to express sentiments opposed to those accepted by the archetypical dogmatic. The scale of 36 items showed a reliability of .91 on the standardization (student) sample and .78 on an adult community sample. Validity is demonstrated for the scale as a whole and for the 2 halves separately. (15 ref.)—*Journal abstract*.

1201. Roubertoux, P., Carlier, M., & Chagniboff, J. (U. Paris, France) **Preference for non-objective art: Personal and psychosocial determinants.** *British Journal of Psychology*, 1971(Feb), Vol. 62(1), 105-110.—Utilized the criteria of representational vs. non-representational art to construct a scale of aesthetic preference which was found to be consistent and reliable. A test of 70 male and 179 female undergraduates with the scale differentiated 2 groups: S_N who showed preference for nonrepresentational art, and S_R who showed preference for representational art. S_N showed higher mean scores than S_R on the 3 scales of the 16 PF (dominance, dependent character, conservatism) and on the scale of globalism of approach. The sociocultural background of the S_N 's family was found to be significantly lower than that of S_R . (17 ref.)—*Journal abstract*.

1202. Ryan, Bruce A., Maguire, Thomas O., & Ryan, Toni M. (U. Alberta, Edmonton, Canada) **An examination of the construct validity of the FIRO-B.** *Journal of Projective Techniques & Personality Assessment*, 1970(Oct), Vol. 34(5), 419-425.—Examined the construct validity of the Fundamental Interpersonal measuring instrument in W. C. Schutz's (see PA, Vol. 33:2479) theory of interpersonal behavior. 3 separate components of construct validity (substantive, structural, and external) as outlined by J. Loevinger were examined and evaluated. A total of 144 noncollege adults represented 3 criterion groups (salesmen, policemen, and service volunteers) for the 3 interpersonal need areas (inclusion, control and affection) measured by the FIRO-B. None of the expectations regarding the 3 components of validity were supported. Data suggest that FIRO-B is not a valid measure of the interpersonal needs as outlined in Schutz's theory of interpersonal behavior.—*Journal abstract*.

1203. Sappenfield, Bert R. (U. Montana) **Perception of self as related to perception of the "ideal personality."** *Perceptual & Motor Skills*, 1970(Dec), Vol. 31(3), 975-978.—Tested the prediction that persons assumed to have normal orientations will perceive their own personalities as similar to the "ideal personality." 86 undergraduates Q-sorted 55 adjectives (a) to describe the self, and (b) to describe the ideal personality. The prediction was confirmed, as evidenced by the findings (a) that median r 's, for individual Ss, between the 2 sets of Q-sort scores, were .67 to .75, for 4 groups who performed both Q-sorts; and (b) that, when group medians were based on 1st Q-sorts by the Ss involved, median self-descriptive Q-sort scores were highly correlated ($r = .85$ to .91) with median ideal-personality Q-sort scores. Across-group r 's between variables were only slightly lower than across-group r 's within a given variable.—*Journal abstract*.

1204. **Silverman, Bernie I.** (Michigan State U.) **Studies of astrology.** *Journal of Psychology*, 1971(Mar), Vol. 77(2), 141-149.—Attempted to determine (a) if astrology yields valid personality descriptions, and (b) why many people feel that it does. It is concluded that traditional astrology is invalid because (a) 1600 undergraduates failed to respond to the Rokeach Value Survey in a manner predicted by astrologers; and (b) patterns of divorce and marriage, personality contingent behaviors, did not correspond to astrological predictions. The variable of membership group saliency was thought to contribute to astrology's apparent validity, because only when astrological personality descriptions were labeled as such did persons see themselves as accurately described by them.—*Author abstract.*

1205. **Stover, Lillian; Guernsey, Bernard G., & O'Connell, Mary.** (Pennsylvania State U., Individual & Family Studies) **Measurements of acceptance, allowing self-direction, involvement, and empathy in adult-child interaction.** *Journal of Psychology*, 1971(Mar), Vol. 77(2), 261-269.—Modified a measure of empathic interaction previously developed by the authors (see PA, Vol. 42:847) to comprise 3 separately scorable subscales. The new coding system demonstrates concurrent validity by correlating .85 with the prior measure, while measuring 3 other variables which are relatively independent of each other: acceptance, allowing self-direction, and involvement. Construct validity for each subscale and the total empathy score was demonstrated with a group of 51 mothers who underwent training in conducting Rogerian play therapy sessions. It is suggested that the new set of scales will prove useful for exploring a wider range of problems in child psychology. (16 ref.)—*Author abstract.*

Inventories

1206. **Farley, Frank H.** (U. Wisconsin) **Generality of faking effects in the dimensional measurement of personality.** *Australian Journal of Psychology*, 1970(Dec), Vol. 22(3), 265-268.—Investigated the faking effects revealed by R. G. Salas (see PA, Vol. 42:12993) and R. G. Salas and J. F. Richardson (see PA, Vol. 42:12994) on tests of the Eysenck Personality Inventory (EPI) using Australian soldiers. 40 American undergraduates were administered the EPI Form A with standard and "fake bad" instructions. No significant effect of a fake bad set on extroversion and lie scales was found, but neuroticism was significantly susceptible to faking. Further analyses suggest that the lie scale tended to expose a malingerer's intention rather than assist in concealing it. Differences in results from those of Salas, and restrictions on the generality of faking effects, are discussed.—*Journal abstract.*

1207. **Felipe, Abraham I.** (U. Philippines, Manila) **Social desirability tendency and endorsement of items in a forced-choice inventory.** *Philippine Journal of Psychology*, 1969(Dec), Vol. 2(2), 12-18.—Tested the hypothesis that (a) information about social desirability (SD) tendency is predictive of choice of inventory statements arranged in a 2-option forced-choice format, and (b) is a construct validity study of an experimental SD scale. 94 undergraduates served as Ss. From scale scores, the number of undecided answers, and the endorsement of the more desirable inventory statements were predicted. Results show that the experimental scale can help predict answers on 2-option inventories,

confirming the above hypothesis and at the same time supporting the validity of the scale.—*Journal abstract.*

1208. **Gravitz, Melvin A.** (Montgomery Coll., Takoma Park, Md.) **Declination rates on the MMPI validity and clinical scales.** *Journal of Clinical Psychology*, 1971(Jan), Vol. 27(1), 103.—Presents the mean number of MMPI items omitted from each MMPI scale on 5962 male and 3528 female job applicants. The mean scores were noted as low. Males tended to omit somewhat more items than females.—*E. J. Kronenberger.*

1209. **Kadri, Z. N.** (U. Singapore) **The use of the MMPI for personality study of Singapore students.** *British Journal of Social & Clinical Psychology*, 1971(Feb), Vol. 10(1), 90-91.—Describes the administration of the MMPI to a final sample of 200 male and 60 female Singapore undergraduates who were representative of the ethnic distribution in their school. Results are compared to MMPI results from a similar study of California freshmen. Similarities between the personality profiles of both S populations are attributed to (a) common knowledge of socially desirable answers to the MMPI, and (b) the process of internalization of affective-cognitive norms of Western culture as postulated by S. L. Fong.—*P. Hertzberg.*

1210. **Lederman, Edward.** (Columbia U.) **An evaluation of the rationale for the forced-choice structure of the Thorndike Dimensions of Temperament.** *Dissertation Abstracts International*, 1970(Oct), Vol. 31(4-B), 2258.

1211. **Lowenberg, Geula.** (U. Minnesota) **Investigation of convergent and discriminant validity of trait dimensions, defined by a self-descriptive adjective checklist.** *Dissertation Abstracts International*, 1970(Oct), Vol. 31(4-B), 2340-2341.

1212. **Platt, Jerome J., Pomeranz, David, & Eisenman, Russell.** (Hahnemann Medical Coll. & Hosp., Philadelphia, Pa.) **Validation of the Eysenck Personality Inventory by the MMPI and Internal-External Control Scale.** *Journal of Clinical Psychology*, 1971(Jan), Vol. 27(1), 104-105.—Test results from the Eysenck Personality Inventory (EPI), the MMPI, and Rotter's Internal-External Control Scale were obtained on 1177 college freshmen and numerous correlations computed. The results supported the construct validity of the EPI.—*E. J. Kronenberger.*

1213. **Shaw, Blair W.** (Ontario Inst. for Studies in Education, Toronto, Canada) **The development of a measure of three conceptual models of behavior.** *Canadian Journal of Behavioural Science*, 1971(Jan), Vol. 3(1), 37-46.—The Beliefs-About-Behavior inventory was constructed to measure the relative extent to which individuals use each of 3 conceptual models of behavior: theological, illness, and psychological. An initial inventory was written, and after a trial with a sample of university students, a final inventory was written and psychometrically analyzed. The final inventory was administered to 329 Ss consisting of undergraduates, nurses, and high school students. A 2nd phase of this study analyzed the inventory scores of a variety of Ss from mental health-related professions. (French summary) (22 ref.)—*Journal abstract.*

Projective Techniques

1214. **Bramante, Michael R.** (City Coll., City U. New York) **Sex differences in fantasy patterns: A repli-**

cation and elaboration. *Dissertation Abstracts International*, 1970(Oct), Vol. 31(4-B), 2273-2274.

1215. Vaught, Glen M. (State University Coll. New York, Oswego) **Autokinetic word writing. Perceptual & Motor Skills**, 1970(Dec), Vol. 31(3), 912-914.—Administered role-playing and standard instructions to 100 undergraduates during autokinetic word-writing sessions. Role-playing instructions produced more words than standard instructions with no apparent loss of projection. The hypothesis that role-playing instructions decrease the degree of ambiguity accompanying the autokinetic word writing technique was not supported.—*Journal abstract*.

1216. Wachtel, Paul L. & Schimek, Jean G. (New York U., Research Center for Mental Health) **An exploratory study of the effects of emotionally toned incidental stimuli.** *Journal of Personality*, 1970(Dec), Vol. 38(4), 467-481.—Examined the effects of emotionally toned (angry or pleasant) incidental stimuli upon fantasy production. Ss told more aggressive TAT stories when highly aggressive passages from a play were audible from the next room (at a volume and fidelity which made it difficult to follow the verbal message) than they did when no such stimulus was playing. No increase in aggression was noted in the presence of a pleasantly toned stimulus. Individual differences in responsiveness to the incidental stimulus were related to other measures of influence by incidental stimuli, and little individual consistency was evident. (17 ref.)—*Journal summary*.

Rorschach Test

1217. Howell, Robert J. & Carlisle, A. Lindsay. (Brigham Young U.) **The effect of hypnotically induced and nonhypnotic mood changes on the Rorschach test.** *International Journal of Clinical & Experimental Hypnosis*, 1971(Jan), Vol. 19(1), 28-36.—Administered the Rorschach to 11 Ss under 4 experimental conditions: posthypnotic happy, posthypnotic depressed, nonhypnotized happy, and nonhypnotized sad. 2 judges correctly distinguished the posthypnotic protocols from the nonhypnotized protocols in every instance and detected at a significant level the "depressed" protocols from the "happy" protocols in both the posthypnotic and nonhypnotized conditions. Virtually no differences existed in the quantitative scores among the 4 conditions. Under the posthypnotic happy condition, Ss gave more positive responses, and under the posthypnotic depressed condition, more negative responses. Ss gave more unique responses in the 2nd posthypnotic condition than in the 2nd nonhypnotized condition. (Spanish & German summaries)—*Journal abstract*.

1218. Reisman, Stephen; Insko, Chester A., & Valins, Stuart. (U. North Carolina) **Triadic consistency and false heart-rate feedback.** *Journal of Personality*, 1970(Dec), Vol. 38(4), 629-640.—Ss viewed slides of the Rorschach cards while listening to heart sounds that were supposedly but not actually their own. Some Ss were told that increased heart rate was a sign of mental health (positive condition), and some that the increased heart rate was a sign of mental abnormality (negative condition). The sign of the heart-rate increase generalized to the associated cards (i.e., was positive in the

positive condition and negative in the negative condition). The triadic effects were not unambiguously occurring when the increased heart rate was associated with achromatic cards.—*Journal summary*.

CLINICAL PSYCHOLOGY

1219. ———. **Focus adolescence: A transcultural seminar.** *Hospital & Community Psychiatry*, 1968(Aug), Vol. 19(8), 250-255.

1220. Albee, George. (Case Western Reserve U.) **The short, unhappy life of clinical psychology.** *Psychology Today*, 1970(Sep), Vol. 4(4), 42-43, 74.—Clinical psychology's association with academic psychology has not been comfortable because the 2 disciplines do not share enough values. There are several options which would divorce clinical psychology from the liberal arts graduate schools; however, funding is not available and it is likely that training of the scientist-professional will not change for some time. Clinical programs will be reduced, nevertheless, as the present generally young psychologists begin to retire and the demand for academic psychologists increases.—*E. J. Posavac*.

1221. Ansbacher, Heinz. **Alfred Adler, individual psychology and Marilyn Monroe.** *Psychology Today*, 1970(Feb), Vol. 3(9), 42-44, 66.—Adler's concern with power relationships, striving for growth, and social interest have meaning for current theories of motivation. Some of Adler's principles were illustrated by applying them to Marilyn Monroe's life and suicide by drawing on her early recollections, inferiority feelings, and lack of social interest. Rather than inquiring into the sources of her maladjustment, Adler would have asked what she was trying to accomplish by a given act. Therapy would then have concentrated on helping her to gain a life goal with more social usefulness.—*E. J. Posavac*.

1222. Azoulay, J. (Mental Health Center Paris, France) **Sur une tentative de psychanalyse appliquée.** [On an attempt of applied psychoanalysis] *Interprétation*, 1970(Jan), Vol. 4(1-2), 41-65. Examines (a) the problems affecting a mental health center in Paris, particularly the "adult" sector and the team work between patients, attendants, and doctors; (b) the reasons why a local health center is more effective than a psychiatric institution; (c) the functions of and differences between psychoanalysis and psychiatry with an emphasis on psychiatric institutions and their therapeutic value; (d) the respective roles of attendants, staff, and the psychoanalyst. It is argued that working daily with psychotics in a psychiatric institution has fostered an artificial relationship between patient and attendants, and created a greater dependency and aggressiveness of patients toward attendants. This can be remedied by the work performed within the community whereby outside intervention and pressure is restricted thus giving the patient more freedom, autonomy and individual attention by psychiatrist or attendants. It is suggested that the institution only intervene as a last measure at which time it must adapt itself to the patient's needs. The attendants should be given more responsibility and independence, and the psychiatrist should act primarily as a hiatus between psychoanalysis and the psychiatric institution so that the latter can achieve the therapeutic value it is seeking. It is concluded that an adequate psychiatric staff plus a varied institutional system will

allow the patient to "live his psychosis as a manner of being rather than as a sickness."—*S. Maze.*

1223. **Barnes, F. W., Vaillant, G. E., Havens, L. L., & Barnhill, J. O.** (Brown U., Div. of Biological & Medical Sciences) **A new approach to the study of psychogenic disturbances.** *New England Journal of Medicine*, 1970(Oct), Vol. 283(18), 959-963. Psychiatry suffers from many misunderstandings and from some of its own excursions into various schools of thought. It needs to become as realistic and meaningful as possible in terms of the doctor's grasp of the inner experience of the patient. Also, a resourceful, resilient, multifaceted approach is sought after by many. Toward these goals a realistic encounter with the primary material of human nature in its many vagaries has been designed through a specially developed use of dramatic works. As background for this, an integrated approach was used to assess the contribution of each school of thought to the development of psychiatry and its present day potential.—*Journal abstract.*

1224. **Blank, Leonard.** (Rutgers State U., Graduate School of Education) **Nudity as a quest for life the way it was before the apple.** *Psychology Today*, 1969(Jun), Vol. 3(1), 18-23.—Surveys of the social backgrounds of nudists suggest that they do not differ from nonnudists in any major ways. The fact that nudists do not appear to be sexually aroused by unclad bodies, implies that sexual arousal is a learned response to nudity. It was found that nudists relative to nonnudists possessed "greater personality deviations, sexual conflicts and inhibitions, and distortions of the body image." Nudism may, therefore, promote mental health for nudists by serving as an outlet for their tensions.—*E. J. Posavac.*

1225. **Brodeur, Claude.** **Freud ou l'impossible dépassement de l'oedipe.** [Freud or the impossible transcendence of the Oedipus complex.] *Interpretation*, 1969(Jul), Vol. 3(3), 119-142.—Analyzes Freudian theory concerning extension of the Oedipal conflict from the family to society, with society considered an exact replica of the family, and Freud's attempt to retrace the origins of the history of human society, from the primal horde stage (with its law of the father), equal rights of brothers, totemic society, society of gods, and finally a society having 1 god as a father substitute. To succeed in forming a society different from the family, men must, "rather than repress their Oedipal conflict, consciously recognize their desire to kill the father and possess the mother, and choose rather, after having accepted the paternal or parental prohibition, to divide amongst themselves... the possible sexual partners, [and] all wealth of that society. This, then, is a true transcendence of the Oedipus complex." 2 replies to the question of why Freud never really managed to theoretically formulate positive ways for a transcendence of the Oedipal conflict are presented: (a) Freud never "terminated" his self-analysis, and the influence on Freud of the society of his time was considerable. Other pertinent questions include: Are contemporary psychoanalysts confined within the Oedipus complex? Will not contemporary social revolutions, including the Chinese "cultural revolution," modify present-day society in the sense of a transcendence of the Oedipal conflict? The latter question is probed in relation to the 4 social revolutions experienced by Quebec in the last 25 yr.—*T. N. Webster.*

1226. **Brodeur, Claude.** **La négation comme facteur essentiel de formation du sujet humain.** [Negation as an essential factor in human development.] *Interpretation*, 1968(Jul), Vol. 2(3), 35-44.—Explains Freud's

ideas on the beginning of human thought, with primitive intellectual judgment proceeding from oral impulses (whether to eat or spit out something), and with a 2nd decision, concerning the real existence of that perceived. Affirmation and negation, a polarity corresponding to 2 groups of impulses (Eros and destruction) represent the demands of an I-pleasure and an I-real. Though Freud does not precisely state, we... add that, if all intellectual judgment is essentially constitutive of the human subject, it is negative type of intellectual judgment according to the very primitive form that we have defined which ushers in the human being to his own subjectivity... it is due to this initial negative type intellectual judgment that the S initially employs a process of repression that is, precisely, a certain manner of completely negating the existence of objective external reality." In illustration of these Freudian thoughts, dreams of patients are presented in which is formulated, by means of symbols, this same negative type intellectual judgment in its most primitive form.—*T. N. Webster.*

1227. **Brown, Fred.** (Mt. Sinai Hosp., Div. of Psychology, New York, N.Y.) **Changes in sexual identification and role over a decade and their implications.** *Journal of Psychology*, 1971(Mar), Vol. 77(2), 229-251.—Evaluated the Rorschach records of 1393 psychiatric and medical patients comprising 2 groups separated by a decade and totaling 1254 for response to Card VI and the sex of figures seen on Cards III and VII. The primary hypothesis stated that there would be a change in the sex of figures seen on these cards, contrary to expectations based upon consensually accepted modal responses and indicating more certainty concerning sexual identification and role in the earlier group. General and specific hypotheses were largely confirmed and their theoretical and practical psychosocial implications discussed. (20 ref.)—*Author abstract.*

1228. **Dax, E. Cunningham.** (Mental Health Services Commission, Hobart, Tasmania, Australia) **Psychiatric aspects of poverty.** *Medical Journal of Australia*, 1970(Oct), Vol. 2(18), 815-817.—Distinguishes between collective, cyclical, and relative poverty and describes their psychiatric characteristics. The danger of putting psychiatric labels on the poor which disguise social factors and lack of money is noted. The psychiatric team is described as confronting the poor under 3 circumstances: (a) when they are referred by a welfare worker, (b) where poverty is associated with a psychiatric condition, and (c) when children from poor homes are referred by various agencies. At the present time, however, "the need for psychiatric intervention most frequently comes because of relative poverty, in which the shame of poverty and its concealment may become the major problem in association with anxiety and depression." Psychiatric disabilities which may be encountered in the hard core poor are described. It is concluded that "when governments assume their full responsibilities, the psychiatric services will have to play a greater part in giving support, advice and treatment than they do at present."—*S. Knapp.*

1229. **Ferriss, Gregory S.** **Evoked responses and their clinical application.** *American Journal of EEG Technology*, 1970(Mar), Vol. 10(1), 17-26.—Defines and illustrates the calculation of averaged evoked potentials (AERs). AER studies of patient and normal groups in the search for clinical correlations are noted. Studies have included IQ, the impaired stimuli attending of schizophrenics, the recovery cycle of psychotics, audiometric studies, and the development of objective tests for

color blindness. It is noted that the "use of AERs in cerebral disorders can often give information which correlates grossly with the location and extent of pathologic lesions." Similarly, AERs have applications in corticography and stereotaxic brain surgery as a means of identifying structures. (24 ref.)—*S. Knapp.*

1230. Godinova, A. M. & Verinskaya, D. K. (Lab. of Medical Genetics, Leningrad, USSR) **Elektricheskaya aktivnost' mozga pri sindrome Shereshevskogo-Turnera i mozaitsizme.** [Cerebral electrical activity in Shereshevsky-Turner's syndrome and mosaicism.] *Zhurnal Nevropatologii i Psikiatrii*, 1970(Jun), Vol. 70(6), 873-879.—Reports results of EEG examinations of 34 7-32 yr. old females exhibiting Shereshevsky-Turner's syndrome (anomalies of body structure accompanied by hormonal and metabolic disturbances) due to certain chromosomal aberrations involving the total absence of sex chromatin or its absence in only some cells (mosaicism). The features characterizing the EEGs of 2 age groups (16 yr. and below, and 17 yr. and over), and mosaicists are detailed. These features are ascribed to the failure of maturation of individual structures in the brain—a specific manifestation of a genetically engendered general somatic disorder. (English summary)—*I. D. London.*

1231. Goldstein, Michael J., et al. (U. California, Los Angeles) **Interpersonal themes in the Thematic Apperception Test stories of families of disturbed adolescents.** *Journal of Nervous & Mental Disease*, 1970(May), Vol. 150(5), 354-365.—Analyzed TAT stories of 24 families containing disturbed adolescents according to: (a) perceptual cognitive structuring of cards; and (b) quality of interpersonal relationships. The cards used had a high probability of stimulating familial themes. 24 13-19 yr. old adolescents in 4 groups (aggressive-antisocial, active family conflict, passive-negative, and withdrawn) and their parents showed distinctive patterns of response to these TAT cards. Parents of aggressive-antisocial Ss perceived minimal involvement among family figures while parents of withdrawn Ss perceived skewed and negative relationships. Parents of active family conflict and passive-negative Ss were similar in perceiving familial relationships with both positive and negative involvement among the characters. Data obtained on Ss was complementary to the parental data for 2 groups (aggressive-antisocial and passive-negative) and congruent for the other 2 groups (active family conflict and withdrawn). Hypotheses concerning the organization and quality of relationships in these families are offered.—*Journal abstract.*

1232. Golubeva, I. V. (Inst. of Experimental Endocrinology & Hormonal Chemistry, Moscow, USSR) **Adaptatsiya interseksov k peremene pola.** [Adaptation of intersexuals to change of sex.] *Zhurnal Nevropatologii i Psikiatrii*, 1970(Jun), Vol. 70(6), 911-914.—Reports observations of 31 cases of sex-change in intersexuals: 13 from female to male and 18 vice versa. Several psychological and behavioral reactions before and after change of sex are described. Sex alteration is possible at any time, due regard, however, being extended to the psychological and physiological factors involved. The most suitable time for this change is at 3-4 yr. and 14-20 yr. of age. Greater difficulties are encountered at the age of 4-10 yr. and after 20-21 yr. (English summary)—*I. D. London.*

1233. Isaeva, E. I. & Milea, Sh. (2nd Moscow Medical Inst., USSR) **O klinicheskikh variantakh epileptoidnoi**

psikhopatii u detei i podrostkov. [On clinical variants of epileptoid psychopathy in children and adolescents.] *Zhurnal Nevropatologii i Psikiatrii*, 1970(Oct), Vol. 70(10), 1556-1560.—Presents results of observations of 38 7-14 yr. old children, exhibiting either epileptoid psychopathy (EP) or pathological traits of character threatening to develop into EP. The clinical distinctiveness of this form of psychopathy is described, and its clinical variants are presented. The "hereditary-constitutional" factor is assigned the major role in the genesis of EP. An unfavorable early environment promotes the emergence of epileptoid personality traits. A genetic connection between EP and epilepsy was not confirmed. (English summary) (15 ref.)—*I. D. London.*

1234. Krasil'nikova, M. N. & Alisevich, K. D. (Bashkir Republic Psychoneurological Hosp., USSR) **O soderzhanii v likvoro i syvorotke krovi psikhicheskikh bol'nykh C-reaktivnogo belka.** [On C-reactive protein content in the cerebrospinal fluid and blood serum of the mentally ill.] *Zhurnal Nevropatologii i Psikiatrii*, 1970(Nov), Vol. 70(11), 1678-1681.—Attempted to elucidate the role of immunological shifts in the cerebrospinal fluid (CSF) in the pathogenesis of diseases of the brain, utilizing simultaneous determinations of the presence of C-reactive protein (C-RP) in the blood and CSF of 217 patients with different neuropsychic illnesses and of 8 normals. A diagnostic breakdown of the former group is presented: schizophrenia (58); epilepsy (50); reactive psychoses, psychopathy, and chronic alcoholism (10); viral and infectious inflammation of the brain (25); residual disorders of earlier meningoencephalitis (30); other noninflammatory diseases of the brain (44). With few exceptions, C-RP was disclosed in the CSF more often when it was also present in the blood. During the treatment of 30 patients with psychotropic drugs: aminazine (chlorpromazine) and haloperidol, C-RP was detected in the blood and CSF more frequently and in higher titres than before treatment. The appearance of C-RP in the CSF during treatment is viewed as an indirect index of the central action of psychotropic drugs, involving the partial formation of C-RP in the CNS. (English summary)—*I. D. London.*

1235. Krippner, Stanley. (Maimonides Medical Center, Dream Lab., Brooklyn, N.Y.) **Hypnosis and psychedelia.** *Journal of the American Society of Psychosomatic Dentistry & Medicine*, 1970, Vol. 17(3), 92-98.—Compares hypnosis and psychedelic experience. (45 ref.)—*M. V. Kline.*

1236. Lagadec, Claude. **La pensée par couple et l'inconscient.** [Binary thinking and the unconscious.] *Interprétation*, 1968(Jul), Vol. 2(3), 21-29. Presents a parallel between the system of the unconscious (Freud) and the binary system of thinking (Wallon's "paired thinking"), including: (a) the presence of contradictory elements in both systems, differing from the non-contradiction required in conscious thinking after ages 7-8; (b) absence of the judgment modality in both systems; (c) absence of the time factor in the unconscious, as compared with a lack of time sense and perception of causality in binary thinking; (d) the total subjection of the unconscious to the pleasure principle, while binary thinking is a temporary structure of extreme rigidity to which the reality principle does not apply; and (e) the dependency of the unconscious on a primary process in which energy is free (or mobile), as contrasted with conscious thinking, the latter depending on a secondary process in which energy is bound to content, while binary thinking is a preconceptual and pre-

relational stage of theoretical intelligence.—T. N. Webster.

1237. Mahrer, Alvin R. (Miami U.) **Interpretation of patient behavior through goals, feelings, and context.** *Journal of Individual Psychology*, 1970(Nov), Vol. 26(2), 186-195.—Offers 3 guidelines and 4 brief illustrations of their use in aiding interpretation of patient behavior. (31 ref.)—A. R. Howard.

1238. Mastukova, E. M. (Research Inst. of Forensic Psychiatry, Moscow, USSR) **Nekotorye razlichia rechevykh narushenii pri shizofrenii i motornoi alalii u detei doskol'nogo vozrasta.** [Some differences in speech disturbances in schizophrenia and motor alalia in preschool children.] *Zhurnal Nevropatologii i Psikhatrii*, 1970(Oct), Vol. 70(10), 1523-1528.—Presents results of a comparative study of speech disturbances in 3-6 yr. old children with catatonic schizophrenia (N = 25) or motor alalia (N = 9). Along with some general symptoms of speech pathology (absence or underdevelopment of verbal communication, echolalia, paraphasia, insufficient perception of oral communication), the "qualitative structure" of these disturbances in both groups was different. These differences are described in detail and analyzed in connection with the general clinical features of both conditions. (English summary)—I. D. London.

1239. Mikhalev, P. V. (Medical Inst., Vladivostok, USSR) **Katamnesticeskoe obsledovanie lits, perenesshikh porazhenie yadovitoi meduzoi primor'ya (gonionemoi).** [Catamnestic study of persons who have suffered injury from the poisonous littoral jellyfish (Gonionema).] *Zhurnal Nevropatologii i Psikhatrii*, 1970(Dec), Vol. 70(12), 1850-1856.—Reports an analysis of catamnestic data on 340 persons who had been stung by gonionemal jellyfish between 1958-1966. During the period of catamnestic study, 139 cases of neuropsychic disorders were noted: 4 psychotic states, 60 neurotoxic disturbances, and 75 somatoneurological deviations. The psychotic states were varied (schizophreniform syndrome against a background of marked organic changes in the psyche, psychosensory form of encephalitis, epileptiform syndrome, dysthymic-hypochondriac syndrome). These states emerged only in those with signs of organic or functional insufficiency of the brain before the stinging. Neurotoxic disorders were expressed in 22 astheno-neurotic, 15 astheno-autonomic, 9 cenesthopathic-hypochondriac, 3 psychosensory, and 11 phobic syndromes. Predominating among the somatoneurological disorders were: 34 stable dermoparesthetic symptoms; 29 constant or periodic muscular-articular, polyradiculoneuritic pains; and 12 periodic convulsive contractions of separate muscle groups or states of sudden muscular weakness of the cataleptoid type. (English summary) (17 ref.)—I. D. London.

1240. Nuckolls, Katherine B. (U. North Carolina, Chapel Hill) **Psychosocial assets, life crisis and the prognosis of pregnancy.** *Dissertation Abstracts International*, 1970(Nov), Vol. 31(5-B), 2796.

1241. Ravkin, I. G., et al. (Moscow Research Inst. of Psychiatry, USSR) **O roli allergicheskogo faktora v razviti i oformlenii klinicheskoi kartiny shizofrenii i epilepsii.** [On the role of the allergic factor in the development and delineation of the clinical picture in schizophrenia and epilepsy.] *Zhurnal Nevropatologii i Psikhatrii*, 1970(Nov), Vol. 70(11), 1682-1686.—Presents an analysis of some clinical manifestations of schizophrenia and epilepsy in connection with the assumed

involvement of an allergic factor (AF) in their genesis. The experiment was based on laboratory examinations of schizophrenics (30 in the acute and 30 in the chronic stage of psychosis) and 80 epileptics (during attacks and at various times before and after). The existence of an AF was confirmed by examination of the state of nonspecific immunity and the monocytogram. The role of an AF was clearly indicated in the development and delineation of the clinical picture for "hypertoxic schizophrenia and torpid catatonic stupor." It is suggested that status epilepticus should be viewed as a hyperergic reaction. The AF occurs in the development of individual epileptic attacks and acute epileptic psychoses. (23 ref.) (English summary)—I. D. London.

1242. Ravkin, L. I. & Maisevich, G. R. (Inst. of Poliomyelitis & Viral Encephalites, Moscow, USSR) **Morfologicheskie izmeneniya v tsentral'noi nervnoi sisteme pri postvaksinal'nykh entselafomielitakh, razvivayushchikhsya posle privokov ospennoi vaksiny u detei.** [Morphological changes in the central nervous system in postvaccinal encephalites developing in children after smallpox vaccination.] *Zhurnal Nevropatologii i Psikhatrii*, 1970(Oct), Vol. 70(10), 1465-1471.—Presents results of a histological study of the CNS in 6 deceased children. The morphological similarity of the cases with experimental allergic encephalomyelitis, as well as (a) the connection between postvaccinal encephalitis and respiratory infections, and (b) the negative data of virological research provide evidence for the allergic (autoimmune) pathogenesis of the encephalites which develop after smallpox vaccination in children. (English summary)—I. D. London.

1243. Rychlak, Joseph F. (Purdue U.) **The two teleologies of Adler's individual psychology.** *Journal of Individual Psychology*, 1970(Nov), Vol. 26(2), 144-152.—Attempts to demonstrate how and why Adler extended "his teleological conception of man as individual actor to an even broader teleology of mankind as a whole, set in directed motion by organic evolution." Offers some implications of Adlerian thinking for contemporary society. A. R. Howard.

1244. Saavedra, Alfredo. **Relaciones somato-psiquicas en medicina: Enfoque psiquiatrico.** [Somatic-psychic relations in medicine: Psychiatric approach.] *Revista de Neuro-Psiquiatria*, 1970(Mar), Vol. 33(1), 17-22.—Discusses the relation between mind and body (i.e., the psychological and organic) regarding physical and mental health. The influence of (a) emotional attitudes, (b) the placebo effect, and (c) the attitude and words of a doctor on organic illness are considered. The psychological factor as the predominant precipitator of psychosomatic illness is discussed. In stressing the importance of considering a person as a mind-body entity, medical progress in treating organic illness is considered very beneficial for psychiatry. —P. Hertzberg.

1245. Thorne, Frederick C. (4 Conant Square, Brandon, Vt.) **Adler's broad-spectrum concept of man, self-consistency, and unification.** *Journal of Individual Psychology*, 1970(Nov), Vol. 26(2), 135-143.—Adlerian psychology represented a broader concept of man than any contemporary theory. Recent years have witnessed a decreasing emphasis on Freud and Jung and an increasing recognition of Adler.—A. R. Howard.

1246. Van Rootselaar, F. J. & Boerma, F. Westendorp. (State U., Lab. of Bacteriology & Serology, Groningen, Netherlands) **Serum levels of immunoglobulins in**

mongolism, in epilepsy and in unclassified mental deficiency. *Psychiatra, Neurologia, Neurochirurgia*, 1968(Nov), Vol. 71(6), 501-507. Compared the immune globulins in 12-24 yr. old mentally deficient patients with those of normal controls. It was found that the 3 globulins tested revealed abnormalities for the mongols.

PERSONNEL

1247. ———. **Psychiatric nursing.** *British Medical Journal*, 1969(Mar), Vol. 1(5643), 526. Reports that the Central Health Services Council again emphasizes the shortage of nurses in psychiatric hospitals. To alleviate the shortage certain recommendations have been made: (a) nurses should be relieved from domestic and clerical work; (b) the size of wards should be reduced to manageable units, and (c) nurses should take a more active part in the treatment of patients and should be prepared accordingly. If these recommendations are accepted, the status of the psychiatric nurse will be raised, and more qualified nurses attracted to the profession.—*I. Halev.*

1248. Anthony, William A. & Wain, Harold J. (Southern Illinois U.) **Two methods of selecting prospective helpers.** *Journal of Counseling Psychology*, 1971(Mar), Vol. 18(2), 155-156. Compared 2 methods of selecting trainees for an empathy training program using 31 army medical corpsmen. 1 method involved obtaining the prospective trainees' pretraining levels of empathic communication; the other method involved presenting the trainees with a brief analogue of the training program for which they were being considered and assessing the effects of this brief training analogue. Although both methods were correlated significantly with training outcome, the training analogue method had a significantly closer relationship ($r=.61$ vs. $r=.35$) with outcome measures.—*Journal abstract.*

1249. Athlestan, Gary T. & Paul, Gerald J. (American Rehabilitation Foundation, Minneapolis, Minn.) **New approach to the prediction of medical specialization: Student-based Strong Vocational Interest Blank scales.** *Journal of Applied Psychology*, 1971(Feb), Vol. 55(1), 80-86. Studied longitudinal data from 1583 undergraduates in an attempt to devise means of predicting eventual specialization for medical students. Specialty membership was determined in a follow-up study 11 yr. after the SVIB was administered. SVIB scales for surgeons, obstetricians, pediatricians, and psychiatrists were developed, using the items which differentiated the specialist groups as freshmen. Senior-based scales were also tested, but predicted no better than those using freshman responses. The resulting student-based scales were reliable on retest, but on measures of distributional overlap, they did not perform as well as standard SVIB occupational scales. However, their predictive validity was superior to that of previously developed SVIB scales for medical specialists. *Journal abstract.*

1250. Carkhuff, Robert R. (American International Coll., Center for Human Relations & Community Affairs) **Principles of social action in training for new careers in human services.** *Journal of Counseling Psychology*, 1971(Mar), Vol. 18(2), 147-151. Selected 14 personnel indigenous to the inner-city and trained them in helping and human relations skills as functional professionals. In turn, 6 functional professionals utilized an internship principle in conducting similar training programs for new careers in human services for 63

essentially unselected hard-core unemployed.—*Journal abstract.*

1251. Dengrove, Edward. (541 N. Edgemere Dr., W. Allenhurst, N.J.) **The hypnotist's subjective experiences during trance induction.** *Journal of the American Society of Psychosomatic Dentistry & Medicine*, 1970, Vol. 17(3), 75-81. Describes the subjective experiences of a number of competent hypnotherapists during the process of induction and discusses their importance to both therapist and S.—*M. V. Kline.*

1252. Dewdney, J. C. (U. New South Wales, School of Health Administration, Kensington, Australia) **Prestige ratings of hospital personnel.** *Hospital & Health Care*, 1971(Jan), Vol. 1(10), 8-9. 63 students of hospital administration, including 18 medical graduates, each ranked 20 hospital personnel groups according to prestige, using the method of extremes. Overall there was close agreement between the medical and nonmedical participant groups. Among the medically qualified group there was least agreement upon the ranking of honorary medical officers (general practitioners), hospital engineers, and members of hospital management boards, nonmedical participants agreed least on rankings of catering officers, medical social workers, radiographers, and theatre sisters.—*Author abstract.*

1253. Griver, Jeanette A. & Robinson, Margot B. (Compsych Systems, Inc., Santa Monica, Calif.) **Multimedia strategies for improving the effectiveness of managerial staff meetings.** *Human Factors*, 1971(Feb), Vol. 13(1), 11-16. Describes a communication training program designed to reduce nonproductive time and increase the level of individual participation during managerial staff meetings. The program was applied to a group of 20 staff members of a 152-bed hospital and was evaluated over a 2-yr period. After a preliminary communication analysis, multimedia feedback techniques were employed to reduce individual communication errors. Performance analyses, audio- and video-tape recordings and playback were techniques employed. Results showing a 46% average time decrease in staff meetings and a 100% increase in individual participation during meetings are being maintained in the 3rd yr. of study.—*Journal abstract.*

1254. Israël, P. **Psychoanalystes—Institutions—psychiatrie—variations.** [Psychoanalystes—institutions—psychiatrie—variations] *Interpretation* 1970(Jan), Vol. 4(1-2), 91-107. Examines the relationship between practicing psychoanalysts and mental institutions, and the problems that these institutions (psychiatric in particular) present to psychoanalysts who wish to be accepted by them. The manner in which psychoanalysts have come to question their place and function in their profession is explained. It is argued that, in the psychiatric institution, the psychoanalyst is challenged by both the psychotic element which lends itself to theory but not to practice, and the social element which accentuates the effects of intrapsychic repression. If he tries to deal with both he and the institution become entangled in contradictions. He must assume the role of mediator between both. Only then can he improve the already deteriorating relationship between attendants and patients, as well as himself and the institution. His own position would be that of psychoanalytical advisor for the nonanalyst, a role similar to that in the analytical psychodrama.—*S. Maze.*

1255. Kemp, David E. (U. Oklahoma, Medical Center) **Normative data for the AB Scale.** *Journal of*

Clinical Psychology, 1971(Jan), Vol. 27(1), 114-115.—A 23-item version of the AB Scale, a predictor of therapist effectiveness, was administered to 10 samples of male Ss. Normative data are presented. Results indicate that the AB Scale is fairly stable across different populations and that scores are more symmetrical in the samples with greater professional training. 3 of the versions of the AB Scale are mentioned as worth considering, and when the AB Scale is used, researchers should consult those studies which report normative data for those versions utilized.—E. J. Kronenberger.

1256. Krebs, Richard. (Sinai Hosp., Baltimore, Md.) **Staff resistance to mental health workers as psychotherapists.** *Hospital & Community Psychiatry*, 1971(Jan), Vol. 22(1), 28-29.—The staff at a department of psychiatry was reluctant to accept as psychotherapists a group of 8 mature housewives trained under a grant from the Maryland Department of Health and Mental Hygiene. The 36-mo course was established to train the women to function in a wide range of helping roles rather than only as psychotherapists. A questionnaire given to 6 randomly chosen senior professional staff members asked for opinions on 25 tasks and included a final question of whether the trainees should be paid for their services. The responses suggested that the women would experience a great deal of frustration in their wish to become psychotherapists. 7 mo. after the 1st rating was made the 6 staff members were queried again and staff resistance was found to have lessened markedly. Factors contributing to staff members' changed perception of trainees' ability and usefulness included community pressure on a relatively small staff to provide psychotherapy, and staff contact with the trainees. The 1 staff member who did not view the trainees more positively after 7 mo. had had little contact with them. The attitude of the women themselves also changed, as they began to see themselves as competent psychotherapists and not as 2nd-rate staff members. R. Soley.

1257. Leighton, Dorothea C. & Cline, Nora F. (U. North Carolina) **The public health nurse as a mental health resource.** *Southern Anthropological Society Proceedings*, 1968, No. 1, 36-46.—Reports findings from questionnaires completed by 106 public health nurses, who furnished data about themselves, about 5 randomly selected patients from their caseloads, and about their caseloads in general. The long-range goal of the study was to devise inservice mental health training programs for public health nurses on the basis of the findings.

1258. Lyons, Thomas F. (U. Michigan, Medical School) **Role clarity, need for clarity, satisfaction, tension, and withdrawal.** *Organizational Behavior & Human Performance*, 1971(Jan), Vol. 6(1), 99-110.—In a mailed-questionnaire study of 156 staff registered nurses, perceived role clarity was related negatively to voluntary turnover, propensity to leave, and job tension, and positively to work satisfaction. The correlations of role clarity with voluntary turnover, propensity to leave, and work satisfaction were nonsignificant for Ss classified as low on a need-for-clarity index; the correlations were significantly higher for Ss with a high need for clarity. The correlations between role clarity and job tension were significant for both subgroups. The concepts of role clarity, the rigidity of role specifications, and the conditions of role specificity, as opposed to the processes of role specification, are discussed regarding organizational theory and change. (41 ref.)—*Journal abstract*

1259. Phillips, Clinton E. (American Inst. of Family

Relations, Los Angeles, Calif.) **A study of marriage counselor's MMPI profiles.** *Journal of Marriage & the Family*, 1970(Feb), Vol. 32(1), 119-130.—Analyzed the MMPI profiles of 149 male marriage counselors for mean scales, standard deviations, variances, and for high and low point characteristics. Of these, 139 were judged as to ability to perform as marriage counselors; differences in profiles were found. It was also hypothesized that there would be manifest differences in the MMPI profile characteristics of Ss from the Protestant ministry and those from other professions. The hypothesis was upheld. Symbolic interaction theory is the framework within which this research was done. A review of literature, a discussion of theory, and this research suggest that this type of study should be helpful to marriage counseling training centers in their selection of persons for training. (29 ref.)—*Journal abstract*.

1260. Rockland, Lawrence H. (Albert Einstein Coll. of Medicine, Yeshiva U.) **Psychiatric consultation to the clergy: A report on a group experience.** *Pastoral Psychology*, 1970(Jan), Vol. 21(200), 51-53.—Since the majority of people bring their emotional problems to their minister or family doctor, psychiatrists can perform an important function by helping these caretakers deal more effectively with the people who consult them.—O. Strunk.

1261. Silverstone, Stanley J. (Postgraduate Center for Mental Health, New York, N.Y.) **On the mystique of training analysts.** *Psychoanalytic Review*, 1970, Vol. 57(2), 283-284.—The chief purpose of training analysis is the personal validation by the student analyst of the existence of the unconscious in himself. The student analyst needs to suffer this narcissistic wound before he can know the nature of such a process in others. "It is suggested that while psychoanalysts who have undergone personal psychoanalysis are probably no healthier than nonanalytic psychotherapists, they will possess certain rational doubts about those things they find themselves defending most strongly, and thus they do take into account an aspect of self-deception which is available only through direct personal experience." D. Prager.

1262. Wilson, Marguerite. (U. California, School of Social Welfare, Berkeley) **Strategies of teaching in corrections.** *Social Casework*, 1970(Dec), Vol. 51(10), 618-624.—4 conflict areas were identified by faculty for social work students in correctional field placements. 51 students were given a questionnaire designed to measure their conflict between responsibility to a client and responsibility to others and society. 16 teaching methods are suggested to help students resolve conflict situations.—M. W. Linn.

1263. Woodbury, Michel. **L'engagement social du psychoanalyste.** [Social commitment of the psychoanalyst.] *Interpretation*, 1969(Jul), Vol. 3(3), 57-83.—In the light of the recent phenomenon of community centering of psychiatric activity, explores the psychiatrist-psychoanalyst's role in the new psychiatry, including: (a) increasing the number of his didactic analyses to multiply as quickly as possible the number of physicians possessing psychoanalytical training, (b) analyzing as many as possible of the members of disciplines directly in contact with populations at risk (physicians, social workers, nurses, educators, parole officers, etc.); and (c) crisis intervention. Factors of the social revolutions of the 20th century, including changes in the role of women and change in family structure are discussed in relation to their effect of disharmony between the generations.

The middle class younger generation, having internalized a family environment in which a "panarchate" replaced the patriarchy, demonstrate for a dehierarchization of other social institutions. "Intellectual racism," another target of the young, is viewed from the standpoints of psychoanalysis and structuralism. Finally, the role of our language is examined with its structure of comparatives, in the "either-or" system in education and other institutions, together with the role of the socially committed psychoanalyst in his involvement with these social institutions. (16 ref.)—*T. N. Webster.*

PSYCHOTHERAPY & ANALYSIS

1264. ———. **Table ronde: Psychanalyse et psychanalystes: Perception de la psychanalyse et des psychanalystes par un groupe d'intellectuels, d'artistes et de militants sociaux de Montréal.** [Round table discussion: Psychoanalysis and psychoanalysts: Perception of psychoanalysis and psychoanalysts by a group of Montreal intellectuals, artists, and social militants.] *Interprétation*, 1969(Jul), Vol. 3(3), 7-36.—Discusses undirected interviews of 23 persons, prefaced by the question: "What do you think of psychoanalysis?" Comments by Ss indicate that psychoanalysis as a concept is meaningful in their lives, part of modern intellectual knowledge, furnishing landmarks in the same sense as Christianity and Marxism. Freudism and Marxism are viewed as competing systems of interpretation. Concerning psychoanalytic ideas, Ss expressed some sympathy, but much less toward psychoanalysts as a social group. Criticisms included: (a) psychoanalysis is a means of assuring social conformity, adjusting the individual to the status quo; (b) certain psychoanalysts, psychiatrists, and psychologists tend to reduce manifestations of social militancy to a phenomenon of individual pathology, and are therefore viewed as a group favoring social conservatism; (c) because of its high cost, psychoanalytic therapy is reserved for a privileged class; (d) the psychoanalyst's abilities might better be used in experiments accessible to more people; (e) to the degree Ss saw psychoanalysis as an undertaking of the highest cerebral order, they were ready to consider it for themselves or to recommend it for others, but (f) to the degree Ss saw the treatment as an affective and interpersonal adventure, they tended to be apprehensive.—*T. N. Webster.*

1265. Ancona, Leonardo. (Catholic U., Faculty of Medicine, Rome, Italy) **Le virement de la dynamique autoplastique à la dynamique alloplastique.** [The turning of an autoplactic dynamism into an alloplastic dynamism.] *Bulletin de Psychologie*, 1969-1970, Vol. 23(4-5), 208-214.—Discusses the influence of psychoanalytic therapy on the moral life of the patient. It is believed that progress obtained via psychoanalysis does not necessarily coincide with moral progress. It is suggested that "actuality testing" be substituted for "reality testing" so that moral progress will reach the same level at the same time as therapeutic progress.—*R. E. Smith.*

1266. Beutler, Larry E. (U. Nebraska) **Predicting outcomes of psychotherapy on the basis of social judgment theory.** *Dissertation Abstracts International*, 1970(Oct), Vol. 31(4-B), 2272-2273.

1267. Bigras, Julien. **Le monstre maternel, un monstre muet.** [The maternal monster, a mute monster.] *Interprétation*, 1970(Oct), Vol. 4(4), 57-104.—Describes the case of a maternal monster dwelling in the imagi-

nation of a 6-yr-old boy and his mother, causing such fear that both Ss were paralyzed with terror: the boy unable to attend school, and the mother forced by fear to stay in her mother's home, which she thoroughly disliked. During psychoanalysis of both (by the same analyst), the following hypothesis emerged: "the boy and his mother absolutely need to invent imaginary monsters (representative and identifiable); the imagination of the mother had been transmitted to her child." Regarding fears experienced by the mother (of dark, empty places in which noises, animals, witches, etc., could be imagined) the analyst discusses his own childhood memories of similar fears which stimulated his curiosity, and evoked the desire to help. The boy is seen as wishing to return to the womb. The void of the womb is thought to underlie the structure of the fantasies, the apperception of which the mind cannot tolerate without faintness. So monsters are invented to fill the void.—*T. N. Webster.*

1268. Bigras, Julien. **L'identification des objets et l'identification au père-ideal.** [Identification of objects and identification with the father-ideal.] *Interprétation*, 1968(Jul), Vol. 2(3), 5-20.—Describes the dreams of a patient who decided to arrange her thoughts during psychoanalysis, giving a precise meaning to fantastic objects which free association had rendered especially invested, and identifying her thoughts and objects of desire. During a sequence of dreams, the patient's preoccupation with identifying objects did not seem evident; in this sequence the mechanism of displacement, involving the interchangeability of "container-contained," was operative in a compulsion of repetition in dreams of a single childhood scene, a prototype modified in material but not in form. In subsequent dreams, manifestly representing a desire to identify objects, the patient, identifying with the analyst, her younger brother, and her father, refused the analyst's desire for free association. In identifying objects, the patient identified with her father-ideal, appropriating his ability to transform raw material into a functional container. In this case, involving the patient's desire to seduce her father, or be seduced by him, only the father-ideal (in the patient's childhood) possessed the ability to identify objects (as did the analyst in the analytical situation). The patient therefore arrogated an ability which, during her childhood, was possessed only by her father.—*T. N. Webster.*

1269. Caprini, G., et al. (Chiarenzi Zevio Hosp., Verona, Italy) **L'utilizzazione del diazepam in associazione alla succinil-colina nell'ellettroshock.** [Diazepam associated with succinylcholine in electroshock therapy.] *Rivista di Neurobiologia*, 1968(Apr), Vol. 14(2), 300-302.—ECT is still used as a cure in psychiatry, especially since barbiturates and succinylcholine have eliminated the danger of muscular-skeletal lesions and cardiac and respiratory complications. In 450 sittings diazepam substituted for the barbiturates. It was found that when used along with succinylcholine, diazepam offers the following advantages: (a) elimination of barbiturates and the consequent dangers of depression and of laryngeal spasm; (b) reduction of the dosage of succinylcholine; (c) possibility to immediately verify the electroconvulsion arrival; (d) absence of unpleasant memories even when one does not succeed in obtaining the electroconvulsion; (e) rare agitation of the patient upon awakening; and (f) less resistance on the part of the patient to accept ECT.—*A. M. Farfaglia.*

1270. Caruso, Igor A. (U. Salzburg, Austria) **Psych-**

analyse et idéologie. [Psychoanalysis and ideology.] *Bulletin de Psychologie*, 1969-1970, Vol. 23(4-5), 215-220.—Discusses the historical and philosophical aspects of psychoanalysis as related to the therapy of psychopathological behavior. Topics such as psychoanalysis as a "latent sociology" and as the practice of an art are also discussed.—*R. E. Smith.*

1271. **Cordner, George M.** (U. Claremont Theological School) **The role of imagination in psychotherapy.** *Dissertation Abstracts International*, 1970(Oct), Vol. 31(4-B), 2276.

1272. **De Marinis, Darlo & Petrella, Fausto.** **Esperienze di psicoterapia individuale nel borderline.** [Experiences of individual psychotherapy in borderline subjects.] *Rivista di Psichiatria*, 1969(Sep), Vol. 4(S), 350-357.—Studied an approach to the problem of borderline which would integrate clinical and psychodynamic possibilities. The problem of borderline is seen as a particular organization of the ego and the use of the nebulous ego. Metapsychological concepts of the borderline are summarized. The life style of these Ss is a type of pseudoreality infiltrated with feelings of depersonalization and an almost hallucinatory style of learning; this is illustrated by the description of a clinical case of a 24-yr-old S. Technical aspects are considered with Schmelberg's contribution emphasized. Traditional psychoanalytical treatment promotes regressive movement as indicated by the underdeveloped ego. An active and selective directive and finalized therapy centered on the ego and on reality is the most beneficial.—*A. M. Farfaglia.*

1273. **Di Mizio, Michele.** **Difficoltà nell'approccio psicoterapico al borderline ricoverato in una corsia psichiatrica.** [Difficulties of the psychotherapeutic approach in borderline inpatients in a psychiatric hospital.] *Rivista di Psichiatria*, 1969(Sep), Vol. 4(S), 368-372.—The psychotherapeutic approach is indispensable in the treatment of a borderline S. Certain factors make this type of treatment difficult. The doctor's 1st concern is to establish if the S is really psychotic. The borderline S causes uncertainties in the doctor, so ECI is used if the S is considered psychotic, or drug therapy if the S is considered neurotic. After the S has been exposed to this, any possibility of another approach is compromised. In a psychiatric hospital the problem is increased by the lack of doctors who have had psychotherapeutic training and by the many interrogations at bedside. A case of a 20 yr. old in a psychiatric hospital illustrates the deficiency of the methods used in such hospitals. In a 9-mo follow up the S verbalized her resentment toward her doctors, the hospital, and her therapy and treatment. It is concluded that even a doctor with a background in psychoanalysis meets with difficulties in such a surrounding, for he must submit to the hospital policy.—*A. M. Farfaglia.*

1274. **Diamond, Michael I.** (Pennsylvania State U.) **A comparison of three content analytic approaches to the analysis of interviewer verbal behavior in the initial psychiatric interview.** *Dissertation Abstracts International*, 1970(Oct), Vol. 31(4-B), 2301-2302.

1275. **Dudek, S. Z.** (U. Montreal, Quebec, Canada) **Effects of different types of therapy on the personality as a whole.** *Journal of Nervous & Mental Disease*, 1970(May), Vol. 150(5), 329-345.—Compares psychoanalytic, medical (drugs, electroconvulsive), and maintenance therapies by means of pre- and posttherapy Rorschachs to evaluate direction of therapeutic change.

The major premise that each therapeutic approach results in different long term effects on the personality as a whole, irrespective of diagnostic label, was confirmed. Psychoanalytically oriented therapies with 26 16-45 yr. old Ss, resulted in a liberation of fantasy and libido and greater awareness. Medical therapies, with 33 14-53 yr. old Ss, resulted in better reality contact but with greater personality constriction. Maintenance therapies, with 29 Ss who were retested 5-18 yr. after initial testing, resulted in no basic personality change in both neurotic and schizophrenic Ss.—*Journal abstract.*

1276. **Duryee, John S.** (Columbia U.) **The therapeutic qualities of professional and nonprofessional helpers.** *Dissertation Abstracts International*, 1970(Oct), Vol. 31(4-B), 2277.

1277. **Eckardt, Marianne H.** **Perspectivas terapéuticas.** [Therapeutic perspectives.] *Revista de Psicoanálisis, Psiquiatría y Psicología*, 1969(May), No. 12, 35-45.—Presents an address from the Third International Forum of Psychoanalysis held in Mexico in August, 1969. Psychoanalytic theory is discussed, noting that theory may have a negative effect on therapy by imposing rigidity. The benefits to be gained from the patient-therapist relation are stressed. It is considered important to reestablish in the patient the feeling of being a vital, living organism. The importance of the therapist's dialogue and his role in directing the patient's feelings is noted. Sleep and dreams are considered very important in therapy. The therapist is also urged to encourage a patient to express his feelings metaphorically.—*P. Hertzberg.*

1278. **Ehrlich, Milton P.** (5 Riverside Dr., New York, N.Y.) **The role of body experience in therapy.** *Psychoanalytic Review*, 1970, Vol. 57(2), 181-195.—Discusses the concepts of various authors concerning body awareness. In behavior one acts with his body as well as with his personality. The body image is fundamental to all experience, and is as resistant to change as any psychological self-attitude. The defensive maneuvers of the body directly parallel the resistance mechanisms operating in the realm of the mind. Awareness of physical being may help open an individual up to psychological self-attitudes. "Therapists should recognize the importance of body awareness in the same way in which they are...attuned to unconscious mental processes." Various experiences with patients are described. (22 ref.) *D. Prager.*

1279. **Fancher, Raymond E. & Gutkin, Daniel.** (U. Rochester) **Attitudes toward science, insight therapy, and behavior therapy.** *Journal of Clinical Psychology*, 1971(Jan), Vol. 27(1), 153-155.—Assessed attitudes toward 2 kinds of insight therapy and 2 kinds of behavior therapy using 145 college students. The insight therapies were preferred but the behavior therapies were viewed as being more scientific. Highly similar results emerged from males, females, natural science majors, social science majors, and humanities majors. It is concluded that the behavior therapist starts out at a disadvantage relative to the insight therapist with respect to the attitude he is met with by the general public.—*E. J. Kronenberger.*

1280. **Görres, Albert.** (U. Munich, Psychological Inst., W. Germany) **Psychoanalyse und Verhaltenstherapie.** [Psychoanalysis and behavior therapy.] *Praxis der Psychotherapie*, 1969(Aug), Vol. 14(4), 184-195.—Reports on the "Scientific Monastery" of Munich, where psychoanalysts and behavior therapists cooperate

peacefully. The latter believe that psychoanalysis and psychotherapy, based on depth psychology, have found a successful competitor in behavior therapy. Theoretical and practical reasons for this are presented. The basic principles of behavior therapy are less speculative and more empirically and experimentally established than those of its "competitors." Its treatment periods are shorter and less expensive, with large quotas of success. Of course, the methods used in behavior therapy are not truly competitive to psychoanalysis. Instead they supplement and simplify the existing therapeutic instrumentality, especially in treating large numbers of patients, e.g., in treating neurotic children in polyclinical institutions. An attempt is being made for a synthesis between psychoanalysis and behavior therapy, to be called "psychoanalytic behavior therapy."—*P. von Toal.*

1281. **Grold, L. J.** (Westwood Hosp., Los Angeles, Calif.) **Problems of confidentiality in treating adolescents.** *Hospital & Community Psychiatry*, 1968(Aug), Vol. 19(8), 246-247.—Suggests that a redefinition of confidentiality is needed in regard to hospitalized adolescents since effective treatment "necessitates maximal intrastaff communication." The advisability of sharing information concerning patients with their families or with clinical and nonclinical staff is discussed. In a review of occasions when hospital psychiatrists had broken the rule of confidentiality, it was found that this usually occurred when the psychiatrist's own anxiety was high or when he felt he might be criticized later for withholding information. It is stressed that any planned breach in confidence must be carefully evaluated. "Only thus can the doctor minimize the influence of his own personal biases . . ." and consider what course of action is the best for his patient.—*B. A. Burkard.*

1282. **Halper, Ira S.** (Presbyterian-St. Luke's Hosp., Chicago, Ill.) **The counterpoint of racial and oedipal themes in the psychotherapy of a Negro patient.** *Psychoanalytic Review*, 1970, Vol. 57(2), 169-180.—Discusses racial and Oedipal themes in the psychotherapy of a Negro theological student. The patient's Uncle Tom facade and clown-like appearance concealed aggressive, competitive strivings. The meaning of color to the Negro is reviewed, and the connection between sexual and racial problems in the relationship between Negroes and whites is explored. Difficulties in the treatment of Negro patients by white therapists is also discussed. The "Negro problem" was used in part as a resistance in this case; however, the racial difference between patient and therapist was not a major obstacle in therapy. Reasons for this phenomenon are suggested. Comments are made relating the patient's choice of a career to some aspects of the clown figure. (30 ref.)—*Journal summary.*

1283. **Heigl, Franz.** **Del pensamiento estructural en el psicoanálisis.** [On structural thoughts in psychoanalysis.] *Revista de Psicoanálisis, Psiquiatría y Psicología*, 1969(May), No. 12, 61-71.—Discusses psychoanalysis as a method of thinking and as a theory of human behavior, elaborating established theories from diverse schools. The concept of structure is discussed from many viewpoints, e.g., topographical, dynamic, genetic, and adaptive, noting that all behavior is an expression of structure. Structured thought, i.e., thought in the hypothetical-deductive system of psychoanalytic theory, is considered in relation to the above viewpoints, as well as considered of organismic or integrative thought. The concept of multiple determination (all behavior has many phases and aspects) is considered unique to psychiatry. Struc-

tural thought is considered to permit the formulation of judgments, conclusions, and predictions relative to the individual, but not to influence temperament, sex, and social capacity.—*P. Hertzberg.*

1284. **Schultz, J. H.** **Gedächtnis des Organischen u. Psychotherapie.** [Organic memory and memory in psychotherapy.] *Praxis der Psychotherapie*, 1969(Aug), Vol. 14(4), 157-167.—Discusses injections of animals with brain extract of reflex-influenced animals. Ungal showed in 1965 that brain extracts of conditioned rats changed the reflexes of mice, creating a "code" for nervous cells. Findings were applied to human reactions and the phenomena are discussed, which are important in psychotherapy: remembering, learning, habit forming, extinguishing, exercising, and schooling. Habit forming, in the meaning of "hardening," leads into the comprehensive problem of forgetting. Normally human memory often refuses to forget certain motives. The behavior therapy endeavors to interrupt undesirable courses of reactions, to "extinguish" them, as producing aversion to alcohol in heavy drinkers by emetin injections and antabus shock, which have proven to be more effective than treatments by hypnosis and suggestion. Steady exercise and schooling are recommended as habit forming.—*P. von Toal.*

1285. **Johnson, Sarah A.** (U. Illinois, Urbana-Champaign) **A comparison of mother versus child groups and traditional versus behavior modification procedures in the "treatment" of disobedient children.** *Dissertation Abstracts International*, 1970(Nov), Vol. 31(5-B), 2989.

1286. **Mathieu, Pierre.** **Identification et symbolisation.** [Identification and symbolization.] *Interprétation*, 1968(Jul), Vol. 2(3), 31-34.—Criticizes J. Bigras (see PA, Vol. 45:Issue 6) report: "Identification of objects and identification with the father-ideal" (concerning a patient in whom a childhood sex play, discovered by her mother, had deeply marked and modified her "libidinal economy"; overneat and perfectionistic since the early experience, her ambivalence toward her mother had deprived her of recourse to identification with her father) in which a series of dreams related to the mother-child experience involved an alternance of "container-contained" (displacement). Contrary to Bigras, the "container-contained" pair is considered the exhibition of a desire to be contained by another desire (the patient's "identification with the father-ideal was in reality no more than symbolic fantasy material serving to reunite her with her mother.")—*T. N. Webster.*

1287. **Nagera, Humberto & Colonna, Alice.** (U. Michigan, Children's Psychiatric Hosp.) **Freud's theory of conflicts.** *Psychoanalytic Review*, 1970, Vol. 57(2), 224-244.—Describes the research being conducted over the last 6 yr. by the Concept Research Group at the Hampstead Child Therapy Clinic, "relating to the study of a large number of preselected basic psychoanalytic concepts as postulated and developed by Freud." The aim of the research is to place Freud's writings in proper context, e.g., noting the historical influences leading to a particular statement. A proper understanding of the hierarchy of psychoanalytic propositions is also emphasized. The research described in this paper applies these methods to the mental forces that can engage themselves in conflicts in the person. (37 ref.)—*D. Prager.*

1288. **Radin, Sherwin S.** (University Bldg., Syracuse, N.Y.) **The effects of a "primal horde" experience in adolescence.** *Adolescence*, 1970(Win), Vol. 5(20), 397-

406.—Presents a case study of a 30-yr-old male in which an adolescent group murder of a hated male teacher became psychodynamically important. The relevance of this experience in the man's psychoanalysis is discussed.—A. B. Warren.

1289. **Rioch, Margaret J.** (Washington School of Psychiatry, D.C.) **Should psychotherapists do therapy?** *Journal of Contemporary Psychotherapy*, 1970(Sum), Vol. 3(1), 61-64.—Suggests that the medical model upon which therapy is based is inadequate. Definitionally, therapy exists when a patient seeks the help of an expert for the treatment of a disease. In psychotherapy, however, the expert cannot help the patient until the patient ceases to be passive and obedient and becomes an active participant. The model for this kind of activity is an educational 1, which may consist of Socratic teaching or behavior therapy. It is considered that whatever the therapy, the word itself is misleading and has resulted in the 2nd-rate position of psychologists and other nonmedical therapists. The awe that society and individuals have for the medical profession is described as a possible hindrance to the activity. Other terms for "psychotherapist" and "patient" are suggested, e.g., psychological counselor and client, which may clarify the issues and the antagonism between the medical and nonmedical professions. It is concluded that "when treatment [e.g., medication and hospitalization] is needed it should be the province of the medical profession. Psychologists would hold a more self-respecting and more consistent position if they undertook the job of education in the area of interpersonal living rather than the treatment of an illness."—S. Knapp.

1290. **Rustin, Stanley L.** (York Coll., City U. New York) **Therapist authenticity in group and individual psychotherapy with college students.** *Journal of Contemporary Psychotherapy*, 1970(Sum), Vol. 3(1), 45-50.—Describes the humanistic approach to therapy. An experience with a group of 8 undergraduates using therapist honesty is presented. Although no pre- and posttherapy testing had been done, a comparison of the GPAs for 4 treatment groups receiving various amounts of group and/or individual counseling was made. Results suggest "that involvement in group and individual counseling, besides providing an important growth experience for the students and the counselor, apparently enabled the students to function more effectively and, for the period they were in counseling, improve their academic performance." An analogy is drawn between the role of the zaddik in the Hasidic Jewish community and the role of the therapist.—S. Knapp.

1291. **Schwartz, Edith.** (382 Central Park W., New York, N.Y.) **A dream which restructured an important memory.** *Psychoanalytic Review*, 1970, Vol. 57(2), 259-262.—Describes therapy sessions with a 24-yr-old man and a particular dream which restructured a critical event in his life. The event had been an expression of rage that had necessitated elaborate defenses to prevent aggression and self-expression. The dream illustrated the patient's increased ego strength (a) in his work and social life, (b) in reduced castration fears about entering a woman, and (c) in the analytic situation. The dream also indicated a change of direction from passivity to activity which continued for many months of psychoanalytic treatment.—D. Prager.

1292. **Seidenberg, Robert.** (State U. New York, Upstate Medical Center, Syracuse) **Noli me tangere!** *Psychoanalytic Review*, 1970, Vol. 57(2), 196-202.—Dis-

cusses a common form of mutiny in marriage—the withdrawal of 1 partner from another. Whether it is the male or the female who withdraws from the union, there is generally unrecognized deep-seated antagonism, revulsion, or fear that must be eliminated if the marriage is to continue. Over the generations "noli me tangere" has been the idiom of alienation. 2 illustrative case studies are included.—D. Prager.

1293. **Thomas, John K.** (U. Rochester) **The perception of therapeutic conditions by hospitalized psychiatric patients.** *Dissertation Abstracts International* 1970(Oct), Vol. 31(4-B), 2292.

1294. **Verny, Thomas R.** (290 St. Claire Ave. W. Toronto, Ontario, Canada) **Analysis of attrition rates in a psychiatric outpatient clinic.** *Psychiatric Quarterly*, 1970(Jan), Vol. 44(1), 37-48.—Patients have to traverse 6 distinct stages if they are going to receive psychotherapy in a psychiatric outpatient clinic. Of 1400 patients who 1st called the clinic for psychiatric help, only 63 actually received more than 7 sessions of psychotherapy. No clear-cut profile emerges of the patient who is likely to complete his evaluation or who is a good psychotherapy prospect.—D. Prager.

1295. **Weckowicz, T. E., Yonge, K. A., Cropley, A. J., & Muir, W.** (U. Alberta, Edmonton, Canada) **Objective therapy predictors in depression: A multivariate approach.** *Journal of Clinical Psychology*, 1971(Jan), Vol. 27(1), 3-29.—170 clinically depressed patients, as assessed by the Beck Inventory of Depression, were administered a number of tests. A correlational analysis of the data was carried out with 20 1st-order and 6 2nd-order factors emerging; 7 significant canonical correlations were found. Basic dimensions and patterns of depression were noted. A 2nd part of the study dealt with finding predictors of the outcome of therapy. The findings indicate those Ss which responded best to ECT, psychotherapy, or drugs. The possibility of constructing a short battery of relatively objective tests for depression is suggested. This battery would consist of: GSR to a noxious stimulus, the amount of alienation, presence or absence of previous admissions, sex of the patient, along with the guilt, self-hate, crying spells, fatigue, and loss of libido measures on the Beck self-administered Inventory of Depression.—E. J. Kronenberger.

Therapeutic Process

1296. **Alby, Jean M.** **Quelques réflexions sur la frustration dans la cure analytique.** [Some remarks on frustration in analytical treatment.] *Interprétation* 1970(Oct), Vol. 4(4), 31-55.—Defines the role of frustration in psychoanalytic therapy, as seen by Freud (abstinence rule), and later by adherents of more active techniques, e.g., Ferenczi. "The frustration-regression transference sequence is the foundation of the analytical situation. Frustration is, for most analysts, an element determining the development of transference which will become 'the strongest resistance,' while it should also be considered as the very agent of the therapeutic action and success." The patient must maintain a balance between impulsive frustration and the pleasure his ego finds in counterinvestments. The analyst's activity is seen as narrowly limited at times: too much frustration of the patient may cause discontinuance; however, too much gratification may hinder the analytical process. (40 ref.)—T. N. Webster.

1297. **Allen, Arnold.** (Cincinnati General Hosp., O.

The fee as a therapeutic tool. *Psychoanalytic Quarterly*, 1971(Jan), Vol. 40(1), 132-140.—As an avenue for the expression of selective firmness and selective permissiveness in psychotherapy, discusses the handling of the payment or nonpayment of the fee. Some clinical vignettes are described to illustrate either firmness or permissiveness in fee handling, based on dynamic and genetic considerations, as being constructive to the patient's progress in therapy. The interaction on this level can play an important part in terms of defining and affirming reality, providing structure, strengthening the ego and superego, or in helping the patient to achieve a greater degree of flexibility, using the therapist as a model for identification. When the charges and fee are not considered in terms of the total therapeutic interaction, a valuable therapeutic tool is being overlooked. —*Journal summary.*

1298. Barande, Robert. **A la recherche du processus analytique.** [In search of the analytical process.] *Interprétation*, 1968(Oct), Vol. 2(4), 5-45.—Discusses pitfalls awaiting the psychoanalyst who attempts to communicate his experience in the analytical process (including an attempt to approach the process by scientific means). 1 difficulty presented is "speaking in the 3rd person of an adventure in which he participated simultaneously in the 1st and 2nd person, and in which, furthermore, the efficacy of the 'workings' came into play in the infraverbal, the unsaid, the non-formulated of the relationship." Having chosen an approach to his discourse, the analyst then finds himself in a position analogous to that of an artist attempting to criticize his own work, in addition to being confronted by seemingly innocent countertransference intrusions. Among others, further pitfalls include: (a) "the risk of infiltration of his metapsychological thought by the rational mental categories of the manifest discourse"; and (b) "assignment of a therapeutic purpose to the analysis and assimilation of the analytical process by the healing process, or implicit acceptance of the didactic purpose of the analysis and by the known affiliation of the psychoanalyst with a professional institution with consequent collusion of the analytical and training processes." *T. N. Webster.*

1299. Brockbank, Reed. (2299 Post St., San Francisco, Calif.) **On the analyst's silence in psychoanalysis: A synthesis of intrapsychic content and interpersonal manifestations.** *International Journal of Psychoanalysis*, 1970, Vol. 51(4), 457-464.—When a patient is silent during analysis he may be resistant (Freud), anal erotic (Ferenczi), showing a defensive ego operation (Anna Freud), or showing the result of the analyst's countertransference (Zeligs). When the analyst is silent he may be using "a potent tool," establishing a unique situation, be encouraging unconscious fantasies or aggressions, be seen as doing interpretation by the patient, or be trying to be suggestive of what he desires from the patient. The idea of analysts' silence acting as an autosuggestive interpretation or engendering countertransference from the patient should be stressed. *J. Chavitt.*

1300. Friel, Theodore W. (State U. New York, Buffalo) **Selected factor analytic studies of relevant process variables of first psychotherapy interviews.** *Dissertation Abstracts International*, 1970(Oct), Vol. 31(4-B), 2280.

1301. Lebovici, S. **L'engagement dans la psychanalyse.** [Commitment in psychoanalysis.] *Interprétation*, 1969(Jul), Vol. 3(3), 37-56.—Defines the conditions

of commitment in both the clinical and didactic psychoanalytical situation with respect to patient and psychoanalyst. For the patient, psychoanalysis is a commitment to understand, to reflect rather than act, to remember and elaborate, to comply with the basic rule of association of ideas; "commitment in psychoanalysis from a desire to be healed and understood or to be healed while understanding, is conflictualizing from the start." The analyst must strike a balance between the desire to heal and the desire to understand. Psychological problems inherent in the contradictory functions of the psychoanalyst in the psychoanalytical situation stem from desire to heal, understand vs. systematic abstinence. Related difficulties of selection by schools of psychoanalysis of persons with the necessary qualities and abilities assuring commitment are discussed. (15 ref.).—*T. N. Webster.*

1302. Sauri, Jorge J. (435 Cordoba, Buenos Aires, Argentina) **Modalidades de estructuración de la situación terapéutica.** [Structural characteristics of the therapeutic situation.] *Acta Psiquiátrica y Psicológica de América Latina*, 1970(Sep), Vol. 16(3), 240-243.—Describes 3 different, but interrelated, "moments" of the therapeutic situation. In the 1st, the "possibility of therapy" situation, there is a hopeless malaise giving rise to a dependence situation; here catharsis is intimately related to an indicative word. In the 2nd moment there is a "common field of significations" where the word is hermeneutic and the biographical temporality is explored. In the last moment—didactical—the medical word is mayeotic and the therapist structures a "karological time" for the therapeutic encounter.—*English summary.*

1303. Shader, Richard L., Binstock, William A., & Scott, Dorothy. (Massachusetts Mental Health Center, Psychotherapy Study Center, Boston) **Subjective determinants of drug prescription: A study of therapists' attitudes.** *Hospital & Community Psychiatry*, 1968(Dec), Vol. 19(12), 384-387.—Reports a study of the influence of the screening therapist's attitudes on treatment outcome in 500 consecutive applications for treatment at an outpatient facility of a mental health center. Factors influencing the interviewer's decision to prescribe antidepressant medication after the initial consultation to a subsample of 100 patients diagnosed as having nonpsychotic depressive reactions are emphasized.

1304. Springmann, Rafael B. (Tel-Hashomer Hosp., Israel) **What he is or what he does.** *International Journal of Psychoanalysis*, 1970, Vol. 51(4), 479-488.—Compares 2 types of intervention: noninterpretative (what the analyst is) and interpretative (what the analyst does). 1 case of each type is described. A cooperative patient responded to interpretations; a negative one to noninterpretation followed by interpretative work. By being what he is and proving it the analyst paves the way for curing by doing what he does. *J. Chavitt.*

1305. Tabata, Osamu. (Kyoto U., Japan) **A consideration of the therapeutic variables in the psychotherapeutic relationship.** *Japanese Psychological Review*, 1969(May), Vol. 12(1), 89-107.—Reviewed recent research problems concerning the therapeutic variables in counseling and psychotherapy and presented theoretical and methodological viewpoints. Some minor research trends were discussed under the following titles: (a) studies on the therapist's therapeutic variables, (b)

studies on the client's therapeutic variables; (c) studies on the therapist-client variables in the relationship; and (d) research methodology and the hypotheses on the psychotherapeutic relationship and personality change. Self-rating inventories for therapist and client were constructed using 120 items. From these inventories, 3 factors were extracted through factor analysis. Using those inventories named "Experiencing Inventories," 2 studies were reported which concerned the characteristics of the therapeutic relationship at the initial interview. (4 p. ref.)—*Journal abstract*.

Group Therapy

1307. Barron, Jules. **Group psychotherapy: Evolution and process.** *Journal of Contemporary Psychotherapy*, 1970(Sum), Vol. 3(1), 27-30.—Describes the history of group therapy from the late 19th century until World War II and the resistance to it. With the large numbers of people needing therapy during that war, group therapy was adopted as a necessary expedient, and has since become widely used and acceptable. It is considered that the history of psychotherapy recapitulates the sociologic maturation of man from primitive to more social forms. "The therapy group may be regarded as a microcosm of society following similar processes of evolution." Individual therapy confirms the value of the individual in an age of mechanization, and group therapy confirms the value of the individual to the community and the value of the community to the individual. Group evolution, process, and history are combined under the term "onto-phylogenetic." 5 different group arrangements are noted with varying numbers of therapists treating individuals, couples, and families.—S. Knapp.

1308. Becker, Robert E., Harrow, Martin, & Astrachan, Boris. (U. Connecticut, Medical School, Farmington) **Leadership and content in group psychotherapy.** *Journal of Nervous & Mental Disease*, 1970(May), Vol. 150(5), 346-353.—Explored the effect of the psychotherapist on the content of group psychotherapy meetings. Content variables including information, opinions, problem solutions, questions, answers, and comments on interaction were studied in a series of conventional, therapist-led group therapy meetings and parallel "unled" group sessions, without a therapist. Ss were 24 psychiatric inpatients. Ratings were obtained for 108 4-min taped segments of group therapy meetings distributed according to a $2 \times 3 \times 3$ factorial design. The 3 factors were: (a) led and unled sessions, (b) patient groups of 3 different therapists, and (c) segments from the beginning, middle, and end portions of group therapy meetings. Data support the hypothesis that conventional group meetings would have more discontinuity of discussion. Partial support is also provided for the hypothesis that (a) more task-oriented and less nontask-oriented material would be elicited in conventional group psychotherapy, and (b) there would be more questions and fewer answers or statements in the therapist-led session. Therapist-led group psychotherapy contained fewer nonpsychologically loaded questions and answers and fewer answers or statements of all types. 3 factors (transference, the focusing on group

process, and the leader as a model of behavior) are advanced to account for the impact of the therapist upon the group. (20 ref.)—*Journal abstract*.

1309. Crary, William G. (U. Southern California, Medical School) **Goals and techniques of transitory group therapy.** *Hospital & Community Psychiatry*, 1968(Dec), Vol. 19(12), 389-391. Describes transitory group therapy, an open-end form of brief psychotherapy in which the membership may fluctuate daily, as especially useful for admissions or observation wards or a crisis intervention clinic. The goals of such therapy and general principles for conducting the groups are outlined. Major advantages and disadvantages are also noted.

1310. Creson, Dan L. & Blakeney, Patricia M. (U. Texas, Medical Branch, Galveston) **Social structure in an adolescent milieu program: Implications for treatment.** *Adolescence*, 1970(Win), Vol. 5(20), 407-426.—Attempted "to determine how accurately the staff perceives the structure and function of the adolescent group within the treatment program . . . [and to] explore the use the staff makes of such knowledge . . . in formulating therapeutic plans." The group consisted of 12 hospitalized boys studied over a 3-mo period.—A. B. Warren.

1311. De Minicis, Carlo & Ranzato, Francesco P. **Il borderline come elemento disgregatore di un gruppo di psicoterapia.** [The borderline as the disrupting element in group psychotherapy.] *Rivista di Psichiatria*, 1969(Sep), Vol. 4(5), 366-368.—In group psychotherapy an element of disturbance could be the introduction of a new element, e.g., a borderline case which was mistaken for a neurotic. The borderline S is not capable of foreseeing the reactions to his behavior, for he is insecure, full of vindications, anxieties, and hypersensitivity with insufficient development of objective relations. Instances where borderlines disrupt group therapy are given. The borderline must be treated in individual psychotherapy; in a group he can be the outside element who inspires or instigates a type of collective mutiny.—A. M. Farfaglia.

1312. Gaburri, Eugenio & De Simone Gaburri, Gilda. **Il borderline nella psicoterapia istituzionale.** [Borderline in institutional psychotherapy.] *Rivista di Psichiatria*, 1969(Sep), Vol. 4(5), 357-362.—Instituted group psychotherapy for so called chronic psychiatric Ss. Any aggressive expression was permitted in the meetings in which the S, through an analytical approach, could express his own complaints and needs. It was observed that the role of the borderline is precise: he is isolated but differently from the schizophrenic. There is a certain pretense in the borderline that his isolation is proof of his own self-sufficiency. Paradoxically the schizophrenic reaches positions of leadership more frequently than the borderline. While the schizophrenic wavers between dependency and negativism, the borderline wavers between submission and mistrust. Although receptive toward the therapist, he shows a frigidity toward the institution and a refusal of its organization. The multipolar rapport and lateral transference permit the borderline to release his hostility. The anxieties connected with the destructive impulses can be calmed in the group because it can be continually attacked but not destroyed.—A. M. Farfaglia.

1313. Goldman, George D. & Brody, Helen M. (Adelphi U.) **An analytic and a behavioristic view of an encounter weekend.** *Group Process*, 1970(Sum), Vol. 3(1), 101-121.—Reviews impressions gained from an

encounter group experience, generalizing them to other such situations. It is concluded that (a) encounter groups appear to be rather ad hoc, without substantial points of contact with adequate and realistic therapeutic goals; and (b) they offer little in the way of substantive contribution to amelioration of personal problems.—A. Barclay.

1314. Gross, Richard S. (U. South Carolina) **The effects of structuring and therapist presence or absence on behavior in a group psychotherapy setting.** *Dissertation Abstracts International*, 1970(Nov), Vol. 31(5-B), 2985.

1315. Hartman, John J. (U. Michigan) **The role of ego state distress in the development of self-analytic groups.** *Dissertation Abstracts International*, 1970(Nov), Vol. 31(5-B), 2986-2987.

1316. Heckel, Robert V., Holmes, George R., & Rosecrans, Clarence J. (U. South Carolina) **A factor analytic study of process variables in group therapy.** *Journal of Clinical Psychology*, 1971(Jan), Vol. 27(1), 146-150.—Group psychotherapy was conducted 3 times a week using a total of 30 male Ss. An analysis of group responding was made and all responses grouped into categories. Intercorrelations of 11 process variables were obtained and presented. 6 factors were derived. Different factors emerged for different stages. "The identification of communalities of the behavior reported here appears to provide considerable information as to what behaviors are meaningfully linked between these 2 stages of group development."—E. J. Kronenberger.

1317. Hofstein, Saul. (Yeshiva U., Wurzweiler School of Social Work) **Modalities in the treatment of family discord.** *Journal of Jewish Communal Service*, 1970(Fal), Vol. 47(1), 20-29.—Social work has increasingly come to the realization that changes accomplished through individual therapy could add to family harmony only as those changes could be accepted by the family and integrated into its total functioning. 1 approach which acknowledges the centrality of the family as a whole is relationship counseling. The individuals involved are engaged separately in interrelated processes, with joint interviews at critical points. This approach is based on the recognition that certain relationships are key to the family functioning. Another approach is conjoint therapy. The complex role of the worker meeting with the whole family is described. 1 of his main tasks is to facilitate communication and interaction. The family must be viewed as an open system or process which maintains its stability through constant changes and renews its energy through its interchanges with the external world. An example of a family interview is given.—S. R. Diamond.

1318. Levin, Raúl E. & Rivelis de Paz, Lea. (G. Araújo Alfaro Polyclinic, Psychopathology & Neurologic Service, Buenos Aires, Argentina) **Aportes para una teoría de la técnica en psicoterapia grupal: Grupos de duración limitada de niños en edad de latencia.** [Contributions to the theory of the technique for group psychotherapy: Short-term groups for children in latency age.] *Acta Psiquiátrica y Psicológica de América Latina*, 1970(Sep), Vol. 16(3), 265-268.—Proposes 2 modifications in short-term dynamic group therapy procedures with children in latency age: (a) the groups should be constituted only by children of the same sex, and (b) interpretations should be made taking into account the fact that regression is spontaneously limited by the mere fact of the time limit, and that, conversely, a deep

regression should not be encouraged. Clinical examples are provided.—English summary.

1319. Marrone, Robert L., Merksamer, Mary A., & Salzberg, Philip M. (Sacramento State Coll.) **A short duration group treatment of smoking behavior by stimulus saturation.** *Behaviour Research & Therapy*, 1970(Nov), Vol. 8(4), 347-352.—2 saturation procedures of different lengths were administered to Ss who desired to quit smoking. Ss chain-smoked for either 20 hr. (Group E1) or 10 hr. (E2). Total abstinence was the main dependent measure. Both groups experienced relatively equal success on a short-term basis. Long-term abstinence was noted for Group E1 only. 60% of the E1 Ss were not smoking 4 mo. after treatment.—A. Barclay.

1320. Ondaraza Linares, Jaime. **Alcuni fenomeni di gruppo nei pazienti borderline: Considerazioni preliminari.** [Some group phenomena in borderline patients: Introductory considerations.] *Rivista di Psichiatria*, 1969(Sep), Vol. 4(5), 381-388.—Studied borderline Ss in group therapy for 2 yr. among students and postgraduates who attended 1½-hr weekly meetings. Borderlines were those Ss with weak egos and peculiar defense mechanisms but appeared to be affected by less serious disturbances. The majority in the group had neurotic disorders. For borderlines relationship within the group is difficult, because it represents a confrontation with reality. Many think that group therapy is the best form of psychotherapy for the borderline. Specific cases are cited where the socializing aspect eventually results in a feeling of belonging. Other phenomena of borderlines in group therapy are (a) positive effects of specular reactions, which help resolve primary narcissism; (b) condensation in an unexpected release of tensions accumulated over successive meetings involving topics discussed by the group; (c) sensitivity; and (d) resonance—answers from borderlines range from ignoring the problem to emotional reaction. Group therapy can be beneficial for borderlines, but 1 must be aware of the difficulties, and frequently individual therapy is necessary before participation in the group. (17 ref.)—A. M. Farfaglia.

1321. Platt, Rhoda. (Family Mental Health Clinic, Jewish Family Service, New York, N.Y.) **The myth and reality of the "matriarch": A case report in family therapy.** *Psychoanalytic Review*, 1970, Vol. 57(2), 203-223.—Summarizes 6 yr. of therapy with a family in which the mother dominated the family functioning. Interaction between family members and therapist was the core of the treatment process. Pathology in children as a reflection of pathology in total family functioning is discussed, in this case stemming from role reversal in the marital pair. The special features of this family caused the therapist to proceed on the assumption that the key to therapeutic success or failure was the mother. Family relationships appeared to have improved by the end of therapy.—D. Prager.

1322. Query, William T. (U. Kentucky) **An experimental investigation of self-disclosure and its effect upon some properties of psychotherapeutic groups.** *Dissertation Abstracts International*, 1970(Oct), Vol. 31(4-B), 2263.

1324. Stuart, Brett R. (Veterans Administration Center, Jackson, Miss.) **Selecting a behavioral alter-**

native through practice. *Group Psychotherapy*, 1968(Dec), Vol. 21(4), 219-221.—Describes action group therapy as being like traditional group therapy with psychodramatic techniques placing emphasis on the immediate behavior of the patient as it effects his successful adjustment to life situations.—A. Krichhev.

1325. **Truax, Charles B.** (U. Calgary, Alberta, Canada) **Degree of negative transference occurring in group psychotherapy and client outcome in juvenile delinquents.** *Journal of Clinical Psychology*, 1971(Jan), Vol. 27(1), 132-136. Measurements of negative transference and patient personality change were obtained on 80 juvenile delinquents involved in group psychotherapy. Negative transference was associated with positive therapeutic benefit. The therapist who was more open, nondefensive, real, or genuine facilitated the expression of negative transference. The greater the occurrence of negative transference, the greater the delinquent's improvement. There was some question as to whether or not a true measure of negative transference was obtained.—E. J. Kronenberger.

1326. **Truax, Charles B., Wittmer, Joe, & Wargo, Donald G.** (U. Calgary, Alberta, Canada) **Effects of the therapeutic conditions of accurate empathy, non-possessive warmth, and genuineness on hospitalized mental patients during group therapy.** *Journal of Clinical Psychology*, 1971(Jan), Vol. 27(1), 137-142.—16 psychotherapy groups with 10 patients each were given a battery of psychological tests pre- and posttherapy. Measurements of therapeutic conditions were obtained on 3 scales. Measurement of patient personality change was also obtained. There was a positive relationship between level of conditions offered during group psychotherapy and degree of therapeutic outcome. There was a significant change on the Sc subscale of the MMPI. Low or high levels of correlations showed negative or positive change, respectively, on the Sc scale.—E. J. Kronenberger.

1327. **Volterra, Vittorio & Soverini, Stefano.** **Soggetti e situazioni "borderline" in un gruppo misto aperto di discussione.** [Borderline subjects and situations in a mixed group open to discussion.] *Rivista di Psichiatria*, 1969(Sep), Vol. 4(5), 391-394.—Observed the behavior of borderline male Ss during a 1-yr period at biweekly meetings attended by Ss, doctors, and assistants. Ss with "marginal" symptomatology manifested a behavior which expressed itself in the desire to stand out, to distinguish himself from the others. With alcoholics, depressives, and neurotics, these borderlines behaved as schizophrenics revealing regressive tendencies; while in groups which were mainly psychotic, they relied on the sources of their ego, limited fantasies, and reinforced personal defenses.—A. M. Farfaglia.

Behavior & Conditioning Therapy

1328. **Ball, Thomas S.** (Pacific State Hosp., Pomona, Calif.) **Treatment by escape-avoidance conditioning: Historic and contemporary applications.** *California Mental Health Research Digest*, 1969(Fal), Vol. 7(4), 165-175.—Defines escape and avoidance conditioning as a unifying concept underlying the diverse treatment procedures of O. Lovaas and M. Seligman, representing the operant approach, and N. Kephart and K. Pryor representing the cognitive approach. Using the work of J. Iliard and R. Seguin, historical procedures are compared

with contemporary methods of Watson, Thorndike, and Pavlov within the escape-avoidance conditioning construct. New applications of training and treatment methods within the same scientific framework are implied.—P. Zell.

1329. **Ferinden, William & Van Handel, Donald.** (Linden, Board of Education, N.J.) **Elimination of soiling behavior in an elementary school child through the application of aversive techniques.** *Journal of School Psychology*, 1970, Vol. 8(4), 267-269.—Presents a case study illustrating the application of aversive techniques in a school setting. Soiling behavior, which had occurred as often as 3 times/day before aversive procedures were initiated, was eliminated in this child with no reoccurrence in a 6-mo follow-up. Results lend additional confirmation to the feasibility of employing aversive conditioning or punishment in modifying or eliminating socially unacceptable behavior. Amelioration of symptomatology appropriately seemed to precede a thorough investigation of etiological factors.—*Journal abstract.*

1330. **Hark, Richard D.** (Michigan State U.) **An examination of the effectiveness of covertant conditioning in the reduction of cigarette smoking.** *Dissertation Abstracts International*, 1970(Nov), Vol. 31(5-B), 2958.

1331. **Hekmat, Hamid & Theiss, Michael.** (Wisconsin State U., Stevens Point) **Self-actualization and modification of affective self-disclosures during a social conditioning interview.** *Journal of Counseling Psychology*, 1971(Mar), Vol. 18(2), 101-105.—Gave 60 18-51 yr. old undergraduates the Personal Orientation Inventory to measure self-actualization, and assigned them to 1 of 4 groups: high self-actualizing, moderate self-actualizing, low self-actualizing, and control. The high self-actualizing group had a significantly higher rate of affective self-disclosures prior to conditioning. Analysis of adjusted scores indicate that the low self-actualizing group had the highest rate of conditioning ($p < .05$). The high self-actualizing individuals showed a nonsignificant gain in the rate of affective self-disclosures during conditioning but were more resistant to extinction as compared to the low and the moderate groups. Findings are discussed in terms of psychotherapeutic theory, practice, and future research. (16 ref.)—*Journal abstract.*

sensitization of test-anxiety. *Dissertation Abstracts International*, 1970(Oct), Vol. 31(4-B), 2287-2288.

1336. Nevin, David A. (Fordham U.) **Prediction of response to a token economy treatment program in a mental hospital.** *Dissertation Abstracts International*, 1970(Nov), Vol. 31(5-B), 2999-3000.

1337. Perloff, Bernard F. (Stanford U.) **Influence of muscular relaxation, positive imagery, and neutral imagery on extinction of avoidance behavior through systematic desensitization.** *Dissertation Abstracts International*, 1970(Nov), Vol. 31(5-B), 3001.

1338. Ploog, Detlev. (Max Planck Inst. for Psychiatry, Munich, W. Germany) **Die Trieb-Dressur-Verschraenkung in der Verhaltenstherapie.** [Instinct-training interlacing in behavior therapy.] *Praxis der Psychotherapie*, 1969(Aug), Vol. 14(4), 167-170.—Discusses knowledge gained in behavior research, covering especially the field of ethology in its application to behavior therapy, keyed to the word development and learning. In training animals, the instinctive drift should be considered: conditioned behavior can, in certain cases, be overruled by unconditioned instinctual behavior, when inborn primary tendencies become stronger than the desire for secondary rewards of the trainer. The art of training has thus to make use of primary appetences by choosing such secondary rewards which resemble the primary ones. In normal human beings, the appetences are "freely convertible" and not rigid courses of action, as is the case with animals. With mental patients, however, the appetences are often no longer "convertible." It is the task of behavior therapy to loosen the faulty instinct-training interlacings so that new modifications of behavior become possible, and the patient can regain freedom of behavior.—P. von Toal.

1339. Rachman, S., Hodgson, R., & Marzillier, J. (Inst. of Psychiatry, London, England) **Treatment of an obsessional-compulsive disorder by modelling.** *Behaviour Research & Therapy*, 1970(Nov), Vol. 8(4), 385-392.—Results suggest that the modeling treatment produced a significant improvement in the patient's obsessional-compulsive behavior. Although the objective data cannot confirm this view, it is felt that the pure response-prevention phase contributed to the maintenance of the improvement. The implosion treatment, "horror" tape, and control tape had no apparent therapeutic effect. The method of treatment described here, while differing from Meyer's owes much to his work. The present rationale was different and placed little weight on Meyer's "expectance change" concept. Instead an attempt was made to combine a modeling approach (based on Bandura's work) with a response prevention technique (based on Baum's work). Experience with 5 patients treated so far has encouraged the plan for a full investigation.—*Journal abstract.*

1340. Ryback, David. (Rohrer, Hibler & Replogle, Montreal, Quebec, Canada) **Cognitive behavior modification: Increasing achievement using filial therapy in the absence of supervision.** *Canadian Journal of Behavioural Science*, 1971(Jan), Vol. 3(1), 77-87. Studied the effectiveness, in the absence of professional supervision, of standard token-reinforcement procedures used by a mother in treating her 13-yr-old mentally retarded son for dyslexia. This procedure followed a 7-mo period during which the S's reading ability had significantly improved. Then supervision was withdrawn and for 2½ mo. the mother-son dyad worked well in a self-sufficient manner. During this period the S made

24,234 single-word reading responses, reading an average of 120 words per min. value of reinforcement. Results support the use of standard token-reinforcement procedures for amelioration of cognitive deficits, especially where professional help is limited for economic or social reasons. (French summary) (33 ref.)—*Journal abstract.*

1341. Suinn, Richard M. (Colorado State U.) **Short term desensitization therapy.** *Behaviour Research & Therapy*, 1970(Nov), Vol. 8(4), 383-384.—Research has raised the possibility that behavior therapy procedures can benefit from even further departures from traditional psychotherapy formats. Although behavioral approaches such as desensitization therapy are distinctive departures from the verbal psychotherapies, there is still an implicit commitment to 1 traditional approach: the reliance upon 1 or 2 weekly appointments. Clients being treated for phobias are typically seen for desensitization sessions twice weekly. Yet, both theory and current research argue for more frequent meetings as being more effective. Robinson and Suinn saw clients with spider phobia daily for 5 consecutive days, meeting 1 hr/day. Clients were tested on a behavioral task prior to and following massed treatment. Results showed that prior to therapy, none of 20 clients was able to place his hands near the spider twice as it moved across the cage. Suinn and Hall relied upon a shorter treatment period: students with test-taking anxiety were desensitized within 24 hr. Results showed that the marathon treated clients showed recoveries to the same degree as that achieved in a group treated for 4 wk. Theoretically, massed treatment should be more effective than spaced treatment.—A. Barclay.

1342. Turner, Wolfgang. (U. Munich, Psychology Div., W. Germany) **Verhaltenstherapie bei einem Patienten mit sozialen Ängsten, Stottern und psychosomatischen Störungen.** [Behavior therapy with a patient suffering from social anxiety syndrome, stuttering, and psychosomatic disturbances.] *Praxis der Psychotherapie*, 1969(Aug), Vol. 14(4), 171-180. The patient, a 23-yr-old office worker suffered from various fears, stuttering, nervous stomach trouble, insomnia, as well as fear of his boss, of talks with various persons, and of phone calls. He was advised to take a leave of absence for 3 wk. for intensive therapy. The treatments given him consisted mainly of exercises for desensitization and for gaining detachments, using the methods of symptom analysis and in vivo training. His fear became controlled, and he learned to overcome his stuttering by metric speech. Back in his office, he was able to act and work with greater self-control and efficiency. His stomach trouble and insomnia disappeared without special medical treatments.—P. von Toal.

1343. Turner, R. K., Young, G. C., & Rachman, S. (London School of Economics, England) **Treatment of nocturnal enuresis by conditioning techniques.** *Behaviour Research & Therapy*, 1970(Nov), Vol. 8(4), 367-381. 115 enuretic children were assigned to 5 treatment groups: 3 groups received Mowrer-type continuous signal, twin signal, or intermittent twin signal conditioning treatment, and 2 groups were given "placebo" or "arousal" control treatments. Over a 1 mo. period, there was no difference between conditioning and control procedures, and it was concluded that further research is needed to determine the basis of treatment response. There was no evidence in support of the escape training hypothesis, and the twin-signal modification to standard bell-and-pad treatment is not recommended. The investigation confirmed the success

of conditioning treatment in bringing about the initial arrest of enuresis (i.e., in 81.4% of the cases) but the relapse rate was high. The investigation provided tentative evidence that intermittent conditioning treatment offers 1 way of reducing the frequency of relapse. The problem of obtaining satisfactory parental cooperation in a badly housed working-class population was apparent, and ways of reducing the demands that treatment imposes on parents are indicated. Results are discussed with regard to theories of conditioning treatment of nocturnal enuresis, and possible improvements in this technique of treatment.—*A. Barclay.*

1344. **Tyler, Vernon O. & Straughan, James H.** (Western Washington State Coll.) **Coverant control and breath holding as techniques for the treatment of obesity.** *Psychological Record*, 1970(Fal), Vol. 20(4), 473-478.—Tested 2 techniques for the treatment of obesity. 57 women volunteers were randomly assigned to 3 groups matched for age and estimated overweight. The coverant control group was trained in L. E. Homme's method. Prior to permitting herself to perform a high probability reinforcing event (e.g., turning on the kitchen faucet or answering the phone), S would emit a negative noneating coverant (e.g., imagining how ugly her fat was) and a positive noneating coverant (e.g., visualizing how attractive she would look when she was slim). Ss in the breath-holding group were trained to take a deep breath and hold it when tempted to eat fattening foods. The control group was taught a modified version of E. Jacobson's relaxation method. The groups were trained in 7 sessions over 9 wk. The coverant control group lost .75 lb., the breath-holding group lost .43 lb., and the relaxation group gained .53 lb. None of these differences were significant. Implications for Homme's theory and further research are discussed.—*Journal abstract.*

1345. **Wallis, Hedwig.** (Hamburg U., Psychosomatische Div., W. Germany) **Erste Erfahrungen mit verhaltenstherapeutischen Verfahren bei Kindern.** [First experiences in applying behavior-therapeutic methods to children.] *Praxis der Psychotherapie*, 1969(Aug), Vol. 14(4), 180-184.—Considers nocturnal enuresis to be based on habit deficiency, established by a variety of causes, including a neurotic and faulty development in the meaning of depth psychology. A conditioning apparatus developed by G. Schröder is described: the child sleeps on a mat which actuates a bell at the 1st drop of urine, thus waking the child, who is then forced to urinate into a container, thus forming the habit of waking when the need to urinate is felt. Adipose children are treated with a proper diet and increased bodily exercises. Specific anxiety syndromes of children, e.g., the fear of medical treatments (injections, catheterizing, etc.), are discussed. Schröder uses the method of reciprocal inhibition leading to desensitization, e.g., tolerating the injection prick without an anxiety reaction. It is concluded that the behavior therapy offers a number of possibilities for an effective elimination of psychosomatic symptoms.—*P. von Toal.*

1346. **Wolpe, Joseph.** (Temple U., Medical Center) **For phobia: A hair of the hound.** *Psychology Today*, 1969(Jun), Vol. 3(1), 34-37.—Phobias of specific stimuli can be removed using systematic desensitization procedures employing deep muscle relaxation. Such desensitization is useful whenever anxiety conditioning lies at the base of the behavior disorder as it does in cases of sexual inadequacy, stuttering, neurotic hypochondria, character neurosis, and psychosomatic states. It appears

"that almost all neuroses stem from emotional habits that are essentially phobias." Follow-ups of 249 cases of neuroses cured by behavior therapy suggest that very seldom does a new symptom replace the 1 removed.—*E. J. Posavac.*

Special & Adjunctive Therapy

1347. **Ament, Philip.** (Roswell Park Memorial Inst., Buffalo, N.Y.) **Removal of gagging: A response to variable behavior patterns.** *International Journal of Clinical & Experimental Hypnosis*, 1971(Jan), Vol. 19(1), 1-9.—Suggestion through hypnosis serves as the logical basis for combined uses of desensitization, retraining, reality testing, reality validation, and learning. Reciprocal inhibition and operant conditioning are combined with classical conditioning, time distortion, posthypnotic suggestion, and specific hypnotic interventions, e.g., analgesia, to facilitate the attainment of the desired goals. The results sought involve the patient's adaptation to dentures but at a minimal emotional price. Results tend to be reinforced by increased self-esteem and improved interpersonal relationships, and are usually self-perpetuating. 3 case histories are presented showing the production of gagging in patients with different behavior patterns. The clinical handling and conditioning are discussed. (Spanish & German summaries)—*Journal abstract.*

1348. **Blume, Sheila B., Robins, Joan, & Branston, Arthur.** (Central Islip State Hosp, N.Y.) **Psychodrama techniques in the treatment of alcoholism.** *Group Psychotherapy*, 1968(Dec), Vol. 21(4), 241-246.—Presents an outline of some of the recurring themes and psychodrama techniques that have been found particularly useful and applicable to the treatment of alcoholism in an inpatient setting.—*A. Krichev.*

1349. **Goldman, Elaine & Goldman, Sally.** (Moreno Inst., Beacon, N.Y.) **Sociodrama and psychodrama with urban disadvantaged youth.** *Group Psychotherapy*, 1968(Dec), Vol. 21(4), 206-210.—Presents an example of the successful incorporation of socio- and psychodrama in Upward Bound programs for disadvantaged high school girls. Role reversal between teachers and girls was especially successful.—*A. Krichev.*

1350. **Gruenewald, Doris.** (Michael Reese Hosp., Psychosomatic & Psychiatric Inst. for Research & Training, Chicago, Ill.) **Agoraphobia: A case study in hypnotherapy.** *International Journal of Clinical & Experimental Hypnosis*, 1971(Jan), Vol. 19(1), 10-20.—Presents the case study of a 58-yr-old woman with a 43-yr history of agoraphobia who was treated with ego-supportive direct suggestion and hypnoanalytic techniques. Literature pertaining to etiological factors and treatment problems is cited. Pertinent details of the S's recent and past history are presented. The treatment plan, course of therapy, and outcome are discussed in the context of limited therapeutic goals and anticipated moderately successful results. A psychodynamically oriented rather than technique-centered approach to hypnotherapy is suggested. (Spanish & German summaries)—*Journal abstract.*

1351. **Herman, Leon A.** (Warwick State Training School for Boys, N.Y.) **An exploration of psychodrama.** *Group Psychotherapy*, 1968(Dec), Vol. 21(4), 211-213.—4 groups of 6 randomly selected boys met in weekly 2-hr psychodrama sessions for 10 wk. The group members had less serious infractions of rules, achieved better academically, and tended to stay for shorter

periods than the average for all inmates.—*A. Krichev.*
 1352. **Hollander, Carl.** (Ft. Logan Mental Health Center, Denver, Colo.) **A blueprint for a psychodrama program.** *Group Psychotherapy*, 1968(Dec), Vol. 21(4), 223-228.—Describes the evolution of psychodrama at a mental health center from a centralized experimental program to a full therapeutic vehicle. Changes include the systematic development of staff training programs on various levels.—*A. Krichev.*

1353. **Pavlovsky, Eduardo A.** **The social influence of psychodramatic techniques.** *Group Psychotherapy*, 1968(Dec), Vol. 21(4), 259-265.—Discusses the use of psychodramatic techniques within an analytic approach as an aide to training mental health workers and to improve the ongoing hospital programs.—*A. Krichev.*

1354. **Sakles, Constantine J.** (U. Maryland, Medical School, Baltimore) **The place of psychodrama in an inpatient psychiatric treatment program.** *Group Psychotherapy*, 1968(Dec), Vol. 21(4), 235-240.—Psychodrama is viewed as having a valuable part to play in the inpatient treatment program as both a means of individual therapy and a chance to use in vivo techniques to expose antitherapeutic situations which exist on the ward. 2 case histories are included.—*A. Krichev.*

1355. **Siroka, Robert W. & Schloss, Gilbert A.** (Moreno Inst., New York, N.Y.) **The death scene in psychodrama.** *Group Psychotherapy*, 1968(Dec), Vol. 21(4), 202-205.—Following the exploration of the protagonist's problems, he can be moved into an existential psychodramatic confrontation with death. He acts what it feels like to die and be dead. He may also be asked to defend himself to St. Peter.—*A. Krichev.*

1356. **Thomas, Marian.** (Utah State Hosp., Youth Center, Provo) **The challenge of music therapy.** *Provo Papers*, 1968(Win), No. 4, 12-21.—Discusses the use of music therapy in the treatment of the mentally ill, and its particular use in a state hospital youth program where it was combined with a variety of other treatment modalities. Illustrations are given of the successful use of music therapy in the treatment of emotionally disturbed children.

1357. **Warner, G. Douglas.** **Psychodrama in a small, private psychiatric center.** *Group Psychotherapy*, 1968(Dec), Vol. 21(4), 229-234.—A 5-yr program is reviewed, and a typical session is described. Psychodrama is seen as a human relations training device as well as a therapy technique. Future plans are mentioned.—*A. Krichev.*

1358. **Watkins, John G.** (U. Montana) **The affect bridge: A hypnoanalytic technique.** *International Journal of Clinical & Experimental Hypnosis*, 1971(Jan), Vol. 19(1), 21-27.—The "affect bridge" is a technique whereby a patient is moved experientially from the present to a past incident over an affect common to the 2 events rather than through an overlapping "idea" as is usual in psychoanalytic association. The current affect is vivified and all other aspects of the present experience hypnotically ablated. The patient is then asked to return to some earlier experience during which the affect was felt and to relive the associated event. A case of a 35-yr-old woman is presented during which 2 affect bridges were used to secure a regression to early oral levels of development as part of the treatment of obesity. Significant conflict material so secured was brought forward to the present to achieve insight and working-through. The technique appeared to achieve significant therapeutic change in a comparatively short period of

time. (Spanish & German summaries)—*Journal abstract.*

Drug Therapy

1359. **Akindele, M. O., Evans, J. L. & Oswald, I.** (University Coll. Hosp., Ibadan, Nigeria) **Mono-amine oxidase inhibitors, sleep and mood.** *Electroencephalography & Clinical Neurophysiology*, 1970(Jul), Vol. 29(1), 47-56.—Presents electrophysiological evidence from the sleeping human (Ss were 7 adult volunteers and 4 patients) to support the clinical impression that a dose of phenelzine (nardil, antidepressant) must exceed a critical minimum and must be administered for longer than a minimum duration if its desired actions are to be obtained. After 5-22 days of phenelzine, 60-90 mg. day, signs of REM (paradoxical) sleep were abolished. Time of abolition in 3 depressed Ss coincided with the start of mood improvement. Up to 52 successive nights without REM sleep had no adverse effects. "Rebound" increase of REM sleep followed withdrawal and also followed phenelzine overdose. Phenelzine tended to reduce restlessness in sleep and cause insomnia on withdrawal. Effects on REM sleep were not observed with nialamide, 75 mg. for 17 days, or with 500 mg. by injection. Brain monoamines are thought to be implicated in the chemistry of sleep as well as in the regulation of mood. (French summary) (23 ref.)—*Journal abstract.*

1360. **Aleksandrovskii, Yu. A.** (Moscow Research Inst. of Psychiatry, USSR) **Ob osnovnykh kriteriyakh klinicheskoi otsenki deistviya trankvillizatorov.** (On the main criteria for clinical assessment of tranquilizer action.) *Zhurnal Nevropatologii i Psikiatrii*, 1970(Dec), Vol. 70(12), 1873-1882.—Studied the clinical action of the minor tranquilizers (meprobamate, amizyl, trioxazin, chlorthalidoxepoxide, diazepam, oxazepam, nitrazepam, etc.) in order to determine their general and specific effects. Their action was observed on 800 ambulatory and hospitalized patients, representing a great variety of neuropsychic disorders. 16 components of clinical action were indicated, and 2 groups of effects were distinguished, traceable to the psychotropic and the neuroautonomotropic action of the preparations. Psychotropic activity was seen in their action upon emotional excitability, particularly as encountered in neurotic and neurotoxic disorders. Neuroautonomotropic activity was displayed in their action upon central autonomic dysfunction and sleep disturbances and in their myorelaxant and anticonvulsive effects. The differential effects of the various tranquilizers were analyzed, ranked, and tabulated, permitting cross-comparisons and differentiated therapeutic use. (English summary) (30 ref.)—*J. D. London.*

1361. **Carney, M. W. & Sheffield, Brian F.** (382 Clifton Dr. N., St. Annes-on-Sea, England) **Associations of subnormal serum folate and vitamin B₁₂ values and effects of replacement therapy.** *Journal of Nervous & Mental Disease*, 1970(May), Vol. 150(5), 404-412.—Presents an investigation of some of the clinical associations of low serum folate and B₁₂ values found in a previous survey of 432 psychiatric inpatients. There were 105 low folate (< 2 ng.) Ss and 53 low B₁₂ (< 150 pg.) Ss, 19 of whom had low values for both. Most low serum values were associated with vitamins. Extrinsic provocative factors. Thus 89% of low folate, 58% of low folate-low B₁₂, and 44.1% of low B₁₂ Ss had received drugs during the 3 preadmission wk: barbiturates, phenothiazines, and antidepressants (in that

order) were the commonest drugs among low folate Ss, and phenothiazines among low B₁₂ Ss. Significantly more low B₁₂ Ss (38.2%) than low folate Ss (18.6%) were physically ill. Low folate Ss had significantly more hematological abnormalities than normal folate Ss, whereas low B₁₂ compared with normal B₁₂ Ss did not. A retrospective survey of results of treatment with folic acid and vitamin B₁₂ supplements reveals that among low folate Ss, 39 received folate and 63 did not. Folate-treated Ss with organic psychoses, endogenous depression, and schizophrenia, when assessed on a 4-point scale, were found to be in a better clinical state at discharge than untreated Ss. There was no evidence that cyanocobalamin-treated low B₁₂ Ss were in a better clinical state at discharge or spent a shorter time in the hospital than similar untreated Ss, though the assessment period was probably too short for firm conclusions to be drawn.—*Journal abstract.*

1362. Davis, Karen V. (U. Illinois, Urbana-Champaign) The effect of drugs on stereotyped and nonstereotyped operant behaviors in retardates. *Dissertation Abstracts International*, 1970(Nov), Vol. 31(5-B), 3018.

1363. Eryshev, O. F. & Mikhalev, I. N. (Bekhterev Research Psychoneurological Inst., Leningrad, USSR) Opyt primeneniya preparata melleril-retard pri lechenii bol'nykh s depressivno-bredovym i trevozhno-depressivnym sindromami. [A trial utilization of melleril-retard in the treatment of patients with depressive-delusional and anxious-depressive syndromes.] *Zhurnal Nevropatologii i Psikhiiatrii*, 1970(Jul), Vol. 70(7), 1055-1060.—Reports results of observations of 42-17-68 yr. old depressed mental patients (7 with schizophrenia, and 27 with affective, 4 with involutional, and 4 with vascular psychoses), undergoing treatment with various doses (50-650 mg. daily) of melleril-retard, a long-acting phenothiazine derivative. Good therapeutic effect is reported for 29 patients—primarily among those with affective disorders where the clinical picture was dominated by anxiety or phobia. The antidepressant action of melleril-retard is viewed as secondary and appeared in the 3rd-4th wk. of treatment in conjunction primarily with a tranquilizing effect what was observed in the first few days of therapy. Along with a certain antipsychotic action, melleril-retard, even in large doses, enjoyed the advantage of incurring no marked sedative effects or marked neurological disorders. Melleril-retard is highly recommended for psychiatric practice. (English summary) (21 ref.).—*I. D. London.*

1364. Fleis, E. P. (Moscow Research Inst. of Psychiatry, USSR) Semiologiia narusheni dvigatel'nykh funktsii pri lechenii neirolepticheskimi preparatami. [Symptomatology of disturbances of motor functions during treatment with neuroleptic preparations.] *Zhurnal Nevropatologii i Psikhiiatrii*, 1970(Dec), Vol. 70(12), 1798-1804.—200-19-85 yr. old patients (179 schizophrenics, 11 manic-depressives, 10 other psychotics) were observed in the course of treatment with various neuroleptic preparations, in order to study the different forms of ensuing neurological side effects. Extrapyramidal disorders, arising from the therapeutic use of neuroleptics, were cut short by the use of pharmacological correctors (various antiparkinsonian preparations and im injections of aminazine—(chlorpromazine)—in cases of treatment by other neuroleptics). 4 symptomatological groups of neuroleptic motor dis-

turbances were distinguished: (a) akineto-rigidity and akinesia, (b) hyper- or dyskineses involving torsional dystonia, athetosis, chorea, ballism, myoclonus, etc.; (c) hyperkineses of the oral region and (d) motor automatisms. Subgroups are identified and analyzed. The utility of symptomatological side effects for differential diagnosis is discussed. (English summary) (31 ref.).—*I. D. London.*

1365. Gentili, E. (U. Milan, Clinic for Nervous & Mental Disease, Italy) Esperienze sull'uso ambulatoriale con un derivato demetilato dell'amitriptilina (nortriptilina). [Experiments on the ambulatory use with a demethylate derivative of amitryptiline (nortryptiline).] *Acta Neurologica*, 1970(May), Vol. 25(1), 126-130.—Observed 80-20-70 yr old Ss suffering from endogenous, reactive, and symptomatic depressions. Ss were given daily dosages of nortryptiline of 30-75 mg. orally for 3 1/2 mo. When a stable result was attained, the dosage was reduced progressively. Side effects were constipation, dryness of the mouth, and urine retention. There was no neurological harm. The 1st positive results occurred from 7-10 days after treatment was initiated. It is concluded that the drug is very efficient with mild side effects. Results were excellent in endogenous depressions and very notable in reactive and symptomatic depressions. (English summary)—*A. M. Farfaglia.*

1366. Gilyadova, L. A. (Central Research Inst. of Forensic Psychiatry, Moscow, USSR) K izucheniiy immunologicheskikh mekhanizmov rezistentnosti k aminazinu. [On immunological mechanisms of resistance to aminazine.] *Zhurnal Nevropatologii i Psikhiiatrii*, 1970(Dec), Vol. 70(12), 1862-1867.—Utilizing complement absorption as index, studied the anti-aminazine (antichlorpromazine) antibodies in the blood of 219 mental patients, 101 of whom were treated with aminazine. Complement absorption was positive in 47% of the cases treated with aminazine, in those cases untreated with aminazine, complement absorption was absent. Only 3% of 131 normal donors exhibited positive complement absorption. The highest number of instances of positive complement absorption was encountered in the group of schizophrenics. Complement absorption is specific not just to aminazine, but is positive for other phenothiazine preparations (stelazine, majoetil, etc.). (English summary) (30 ref.).—*I. D. London.*

1367. Horvath, Dennis P. (Long Island Consultation Center, N.Y.) Some psychodynamic considerations in patients referred for chemotherapy. *Journal of Contemporary Psychotherapy*, 1970(Sum), Vol. 3(1), 57-60.—Considers the triangles of chemical agents vs. emotional disturbance vs. organicity and therapist vs. psychiatrist vs. patient both to be a product of the patient's own mother vs. father vs. child triangle. Possible internal monologues are presented as the patient's reactions to referral to the chemotherapist and the prescription of medication. Exaggerated reports of side effects, difficulty in swallowing, and the quest for sleeping pills are discussed in terms of this model for the psychodynamics of the patient. Some difficulties for the patient who must stop taking the drugs after an extended length of time are discussed.—*S. Knapp.*

1368. Huessy, Hans R. & Wright, Alice L. (U. Vermont, Medical School) The use of imipramine in children's behavior disorders. *Acta Paedopsychiatrica*,

1970(Jul), Vol. 37(7-8), 194-199.—Among 52 children diagnosed as hyperkinetic, 67% showed marked improvement on an average daily dose of 50 mg. of imipramine. Because it can be administered once a day, it becomes the first drug of choice. Extensive laboratory study revealed no negative effects in 20 Ss. Side effects were minimal, occurring largely among children showing no beneficial effects.—G. Rubin-Rabson.

1369. Johnson, Gordon; Maccario, Micheline; Gershon, Samuel, & Korein, Julius. (New York U., Medical School) **The effects of lithium on electroencephalogram, behavior and serum electrolytes.** *Journal of Nervous & Mental Disease*, 1970(Oct), Vol. 151(4), 273-289.—Studied the effect of acute and chronic administration of lithium carbonate on EEG, behavior, and serum electrolytes in 10 patients. 5 Ss, 3 of whom were manic-depressive in the manic phase, and 2 who were schizoaffective in the excited phase, received lithium as part of a double blind, controlled evaluation of lithium and chlorpromazine in manic states. The remaining 5 were patient volunteers in a study of the effect of lithium on electrolyte metabolism. A base-line EEG was followed by ingestion of 750 mg. of lithium carbonate, and after 1½ hr., an acute postdrug EEG was repeated and blood was drawn for serum lithium and electrolyte analyses. A 3rd record was taken after chronic administration of lithium. Acute lithium administration produced only minimal EEG changes without the presence of behavioral change. Transient fluctuations in serum electrolytes were observed. Following chronic administration, the presence and severity of the EEG changes were most highly correlated with neurotoxicity. EEG changes observed included alterations in the alpha activity, diffuse slowing, accentuation of focal abnormality, and changes in average evoked response. Although there was some relationship between serum lithium levels and EEG changes, S-specific variations, cerebral organic disease, and, possibly, sodium balance are important variables. Clinical psychiatric change was not related to EEG changes. The problem of drug-specific EEG changes and possible modes of action of lithium are discussed. (34 ref.)—*Journal abstract*.

1370. Knobel, Mauricio. (U. Buenos Aires, Psychiatric Clinic, Argentina) **Die Anwendung von Psychopharmaka bei Kindern und Jugendlichen.** [The use of psychopharmaka in children and adolescents.] *Acta Paedopsychiatrica*, 1970(Jul), Vol. 37(7-8), 200-212.—The increasing number of patients makes the use of psychopharmaka imperative in psychiatric practice. A study of psychodynamic factors may elucidate the actual drug action. 4 fundamental variables must be considered: child, mother, family, and physician. Each of these may show a placebo attitude, in favor of the curative action, or an antidrug action, undoing the results of the medication or provoking toxic reactions or side effects. The drug has an added symbolic significance, as magic, idealized, gratifying, healing, or the opposite. The manner of administration—oral, anal, or parenteral—has, depending on the individual, psychodynamic implications. By means of the drug, a psychic dissociation comes about which may allow discrimination and favor the development of the ego in the place of psychotic personality segments. Every drug-treated child is a child with organic pathology, since the drug has modified his CNS. This adds an extra variable to research in etiology and therapy.—G. Rubin-Rabson.

1371. Lader, M. H. & Mathews, A. M. (U. London, Inst. of Psychiatry, England) **Comparison of methods of relaxation using physiological measures.** *Behaviour Research & Therapy*, 1970(Nov), Vol. 8(4), 331-337.—The effects of a single injection of methohexitone sodium or saline were monitored in 18 anxious patients using forearm blood flow, heart rate, skin conductance, and frontalis EMG. The physiological changes were compared to those when the patients listened to tape-recorded instructions to relax or listened to a tape of neutral content. No differences were found between the treatments except for an increase in skin conductance fluctuations following the injection. A marked dose-dependent tachycardia was induced by methohexitone sodium.—A. Barclay.

1372. Lesser, Leonard I. (Child Guidance Center of Orange County, Costa Mesa, Calif.) **The children's psychopharmacology clinic: Its role within a total program for children's psychiatric services.** *Acta Paedopsychiatrica*, 1970(Jul), Vol. 37(7-8), 212-222.—Of 300 children, 30% of whom were psychotic, for a large number, the incorporation of psychopharmacological agents enabled the disturbed child to remain at home pending the planning of remoter goals. Preliminary studies suggest these agents produce rapid symptomatic improvement followed by a plateau which is maintained. If this can occur at a point of crisis, intervention can prevent deterioration of the child's social milieu and facilitate the recovery process.—G. Rubin-Rabson.

1373. Mashkovskii, M. D. (All-Union Research Chemico-Pharmaceutical Inst., Moscow, USSR) **Adrenergicheskie mekhanizmy deistviya antidepressantov.** [Adrenergic mechanisms involved in the action of antidepressant drugs.] *Zhurnal Nevropatologii i Psikiatrii*, 1970(May), Vol. 70(5), 750-759.—Presents a survey of the data and views concerning the influence of psychotropic preparations on the adrenergic processes in the CNS. The significance of the adrenergic processes in the pathogenesis of depressions is stressed along with their role in the mechanisms involved in the action of contemporary antidepressants. A tabulation is given of the influence of a wide range of psychotropic agents on the behavioral and affective reactions of man and animals, and noradrenaline content in the brain. The methods of pharmacological research, utilized in the search for new antidepressant preparations, are examined. (English summary) (90 ref.)—I. D. London.

1374. Rumyantseva, G. M., Faktor, M. I., & Nefed'eva, M. I. (USSR Academy of Medical Sciences, Inst. of Psychiatry, Moscow) **Primenenie soli litiya dlya profilaktiki afektivnykh pristupov.** [The use of lithium salts for the prophylaxis of affective attacks.] *Zhurnal Nevropatologii i Psikiatrii*, 1970(Nov), Vol. 70(11), 1712-1718.—Observed 52 ambulatory patients with mental disorders, involving attacks predominantly characterized by affective disorders. These included 32 cases of attack-like schizophrenia (discontinuous course), 16 cases of cyclothymia, and 4 of psychopathies with phasic disorders of mood. Treatment with lithium carbonate extended over a period of not less than 6 mo. These salts were effective in the prophylaxis of manic and depressive attacks. Several stages in their preventive action were distinguished: The 1st appeared after 3-4 mo. of treatment and was characterized by a change in the clinical picture of the attacks. The 2nd stage ensued after 6-7 mo. of treatment with shortening of the attacks and

lengthening of the lucid intervals between them. The 3rd stage ensued toward the end of the 1st yr. and was characterized by a decrease in the number of attacks, followed by their complete disappearance. (English summary) (19 ref.)—*I. D. London.*

1375. Schapira, Kurt; McClelland, H. A., Griffiths, N. R., & Newell, D. J. (U. Newcastle upon Tyne, England) **Study on the effects of tablet colour in the treatment of anxiety states.** *British Medical Journal*, 1970(May), Vol. 2(5707), 446-449.—Treated 48 patients with anxiety states, attending psychiatric outpatient clinics with oxazepam (serenid-D), which was administered in tablets of 3 different colors—red, yellow, and green. Every patient received 1-wk treatment with each color, according to a random program. A latin square design was used to ensure complete balance between the colors and between the weeks. The patients' symptoms were categorized and assessed by both weekly physicians' ratings and daily self-rating, which showed close agreement. Color preference was shown on both these scales in that symptoms of anxiety were most improved with green, whereas depressive symptoms appeared to respond best to yellow. Such color preferences, however, did not reach levels of statistical significance, except for phobias as rated on the physicians' assessment. Results indicate that color may play a part in the response to a drug.—*Journal abstract.*

1376. van Krevelen, D. A., Maresca, A., & Schreurs-Dijkstra, M. (3 Scheveningswert, The Hague, Netherlands) **Evaluation of tegretol in the treatment of behaviour disorders in children: Methodology and results.** *Acta Paedopsychiatrica*, 1970(Jul), Vol. 37(7-8), 222-234.—14 children, 7 Dutch and 7 Italian, nonepileptic but hospitalized, were treated with tegretol for 8 wk. Outcome was evaluated by analysis of observation reports, EEG curves, and Bourdon test results. The drug noticeably decreased aggressiveness and hypermotility, and side effects were only temporary. Disparities in the Dutch-Italian data were probably due to the greater role of gross cerebral damage in the Italian institution.—*G. Rubin-Rabson.*

1377. Wilbanks, George D., et al. (Rush Medical Coll., Presbyterian-St. Luke's Hosp., Chicago, Ill.) **Toxic effects of lithium carbonate in a mother and newborn infant.** *JAMA: Journal of the American Medical Association*, 1970(Aug), Vol. 213(5), 865-867.—Describes the case of a 30-yr-old woman receiving carefully monitored lithium carbonate therapy in late pregnancy who developed a toxic condition during the delivery process, apparently due to hemodynamic or metabolic alterations or both, as no additional lithium carbonate was given. Massive diuresis was effective treatment. The infant also had elevated serum lithium ion levels with the clinical signs of cyanosis and flaccid muscle tone. Both mother and infant recovered without obvious permanent damage. Extreme caution should be used with lithium carbonate therapy in late pregnancy until further data can be obtained on the maternal-fetal relationship. The promise of effective therapy must be weighed with therapeutic benefit.—*Journal abstract.*

HOSPITAL CARE & INSTITUTIONALIZATION

1378. Barter, James T. & Langsley, Donald G. (Colorado Psychiatric Hosp., Adolescent Ward, Denver) **The advantages of a separate unit for adolescents.** *Hospital & Community Psychiatry*, 1968(Aug), Vol. 19(8), 241-243.—Describes a 15-bed adolescent unit serving patients of high school and junior high school age. It is

suggested that on an all adolescent ward a structured program can be developed which is geared to the needs of this group. Although staff problems can be troublesome, personnel who are responsive to the needs of young people can be found. Individual psychotherapy, patient-staff meetings, sociodrama, small group therapy, family therapy, and parent-group therapy are used. Patients and families receive pamphlets describing ward policies, privileges, and restrictions. 2 resident school-teachers tutor individually. An environment is created in which adolescents can get better by understanding the roots of their behavior, and by seeing the harm it does and the rewards of altering it.—*B. A. Burkard.*

1379. Bigras, Julien. **Introduction au problème que pose la présence du psychanalyste dans l'hôpital psychiatrique, au Québec.** [Introduction to the problem of the psychoanalyst's presence in the psychiatric hospitals of Quebec.] *Interprétation*, 1970(Jan), Vol. 4(1-2), 133-136.—Discusses the general dissatisfaction of psychoanalysts in French Quebec regarding their work and responsibility in the psychiatric hospitals and gives several reasons for this attitude. These include: (a) an incompatibility between private and hospital practice, (b) the tendency of a psychoanalyst to reduce the hours of work devoted to the hospital, (c) the loss of interest in treating patients at the hospital, and (d) the refusal to engage in hospital administration and activities. It is also noted that the psychoanalyst tends to escape the "bad areas" of practice, e.g., prisons and asylums.—*S. Maze.*

1380. Bossé, Jean. **Psychoanalyse, psychiatrie et institutions psychiatriques.** [Psychoanalysis, psychiatry and psychiatric institutions.] *Interprétation*, 1970(Jan), Vol. 4(1-2), 137-143.—Examines the ambiguous role of the psychoanalyst in the hospitals of Quebec, his reasons for practicing in a hospital, his responsibility to this institution and the relevance of his individual work to psychoanalysis in general. It is proposed that psychoanalysis has deviated from its original objectives by becoming confused with psychiatry. The psychiatrist and psychoanalyst are distinguished from each other: the former is primarily a doctor whose purpose is to reintegrate his patient into society while the latter is especially interested in the unconscious, the psychic and latent structures of the human mind. Both are incompatible, should be considered as such, and must perform their function separately.—*S. Maze.*

1381. Buxner, Robert M. (Louisiana State U.) **Prediction of post-hospital adjustment for psychiatric patients after an instrumented training program.** *Dissertation Abstracts International*, 1970(Oct), Vol. 31(4-B), 2274.

1382. Cowell, Daniel D. (National Inst. of Mental Health, Washington, D.C.) **Developing community-oriented teamwork on an admissions ward.** *Hospital & Community Psychiatry*, 1971(Jan), Vol. 22(1), 1-4.—A therapeutic community, in which responsibility for making some decisions had been given to patients, proved to be unworkable. After an increase in staff anxiety and dissension, administrative control was returned to the doctors, and the staff was seen to relax and resume their more accustomed and time-tested roles.—*R. Sivley.*

1383. Faux, Eugene J. & Farley, O. William. (State Div. of Mental Health, Children's Service, Provo, U.) **An evaluation of a hospital youth center.** *Hospital & Community Psychiatry*, 1968(Aug), Vol. 19(8), 244-245.—Discusses findings from a research project, con-

ducted by 10 candidates for master's degrees in social work, on different aspects of the youth program at Utah State Hospital. The hospital youth program is described and results of 4 of the student topics are detailed.—B. A. Burkard.

1384. Frécourt, Jean. (Mental Health Center, Paris, France) **Malaise dans l'institution.** [Uneasiness in the institution.] *Interprétation*, 1970(Jan), Vol. 4(1-2), 109-131.—Examines (a) the need for a real rather than formal division of theoretical and practical work in the institution within the context of a mental health center in Paris, (b) the function of the psychoanalyst and the difficulties he encounters in an institution (for psychotics primarily), and (c) the role of the attendants vis à vis the analyst and the patients. It is noted that there has been a growing feeling of uneasiness within the mental institution due to problems, e.g., (a) a sense of rigidity, and immobility from within; (b) the absence of autonomy among the staff, the immaturity of attendants (especially in conflicts among themselves), and their excessive dependence on a psychiatrist and psychoanalyst who is often absent; (c) inadequate treatment for neurotics and psychotics; and (d) a passive and regressive state among patients that has been induced by poorly planned hospitalization and an artificial patient-attendant relationship. The 2 aspects of institutional activities are distinguished from each other as either functional (administrative duties) and specific (treatment of mental patients). It is argued that a sense of movement must be maintained by individual members as well as by the institution as a whole so that a concerted effort can be adopted toward the patient. A study of the "collective psychology of the institution" based on Freud, as well as that of its whole structure, including the roles of attendants is proposed. More freedom of thought, better communication among staff members and the separation of psychoanalytical from institutional responsibilities are suggested.—S. Maze.

1385. Friedman, Irwin. (Westwood Hosp., Los Angeles, Calif.) **A youth activity group.** *Hospital & Community Psychiatry*, 1968(Aug), Vol. 19(8), 247-250.—Describes a program created for young patients who were disrupting an entire hospital routine. Ss were formed into a group consisting initially of 10 14-22 yr. old boys and girls who met with a therapist every weekday for an activity program. Although the 1st meeting was turbulent, a cohesion developed which was attributed to "a collective desire to establish identity through peer relationships." The group agreed that the most important part of the program was the "small world created for and by the group." Most Ss needed help in developing a mature self-image and responding appropriately to authority. Behavior and goals were not stereotyped. Experience indicates that a "well-organized, carefully structured program for younger patients exerts a beneficial influence on their total clinical management and enhances the effectiveness of dynamic treatment procedures."—B. A. Burkard.

1386. Gottlieb, Brian M. & Digiondomenico, Peter A. (Child & Family Mental Health Services, Lewiston, Me.) **Modifications of a therapeutic community on a brief-stay ward.** *Hospital & Community Psychiatry*, 1971(Jan), Vol. 22(1), 23-24.—A small psychiatric unit (20 beds) seeking to use therapeutic community concepts found it necessary to modify several techniques. Patients were assigned to committees, including a privileges and welcoming committee. Another committee was responsible for assigning housekeeping tasks on the unit, and

inappropriate individual behavior was made the problem of the entire group. Modifications are described as a "segmented approach" designed to enable the staff to handle problems more effectively than would a massive interruption of all community functions. Evaluation of the program is described as being difficult because of the brief length of stay that is characteristic of patients in this unit.—R. Sivley.

1387. Graham, John R., Allon, Richard; Friedman, Ira, & Lilly, Roy S. (Kent State U.) **The Ward Evaluation Scale: A factor analytic study.** *Journal of Clinical Psychology*, 1971(Jan), Vol. 27(1), 118-122.—The 69 items of the Ward Evaluation Scale were intercorrelated and the matrix of item intercorrelations factored using a principal components analysis. After rotation 6 psychologically interpretable factors emerged: staff interest in patients, cleanliness of ward, absence of disturbing noise on the ward, staff permissiveness and sensitivity, patient comfort, and adequacy of hospital services. 5 factor scales were developed and item numbers presented. The derived factor scales did not closely parallel the original rational scales. A replication of this study is suggested.—E. J. Kronenberger.

1388. Graham, John R., Lilly, Roy S., Allon, Richard, & Friedman, Ira. (Kent State U.) **Comparison of the factor structures of staff and patient responses on the Ward Evaluation Scale.** *Journal of Clinical Psychology*, 1971(Jan), Vol. 27(1), 123-128.—A factor analysis of the Ward Evaluation Scale (WES) for staff responses was completed, and the results are presented. 5 salient dimensions in the staff perceptions of hospital wards were noted and factor scales were constructed for 4 of the factors. The derived staff factor scales did not correspond closely to the original rational subscales of the WES and differed from previously reported data for patient responses.—E. J. Kronenberger.

1389. Labbé, Pierre & Mathieu, Pierre. **Le psychanalyste et la clinique externe.** [The psychoanalyst and the external clinic.] *Interprétation*, 1970(Jan), Vol. 4(1-2), 145-149.—Discusses the general function of a psychiatric clinic in Quebec that is (a) designed to give the best possible treatment to a selected group of patients (whose financial means is secondary); (b) maintain a full-time staff of doctors; and (c) give special, and, if necessary, daily attention to a patient. The growing need for a psychoanalyst to be independent of the psychiatric hierarchy and administrative structure of the hospital is examined.—S. Maze.

1390. Mahel, Sanford. (Veterans Administration Hosp., Roseburg, Ore.) **Outcome of patients' assuming a staff function.** *Hospital & Community Psychiatry*, 1971(Jan), Vol. 22(1), 25-28. Several methods of studying the outcome of patients' assuming a staff function were developed. A committee composed of representatives from various patient groups, called the Patient Evaluation Committee, was selected to make recommendations concerning notes submitted by staff and other patients. Differences in note categories before and after the new system was instituted were studied. Other methods used to evaluate the effect of the note system were to ask staff members at 6-wk, and 4- and 6-mo intervals to compare their impressions of the ward. A 3rd method was to ask the views of the ward consultant, who had visited the ward monthly for a period of 6 yr.—R. Sivley.

1391. Mace, Douglas L. (U. Rochester) **College volunteers as group leaders with chronic patients: Effects of ward personnel involvement on ward**

behavior change. *Dissertation Abstracts International*, 1970(Oct), Vol. 31(4-B), 2287.

1392. **Morentz, Paul E.** (Veterans Administration Hosp., Martinez, Calif.) **A simple method of coding psychiatric records.** *Hospital & Community Psychiatry*, 1971(Jan), Vol. 22(1), 12-13.—A mimeographed code booklet and code sheet developed by the investigator lists 43 factors to be coded and the explanations of the code. About 5-10 min. of ward secretary time is required for coding the majority of items, while the physician codes the remainder, in from 30 sec. to 5 min. Included in the code are such factors as age, sex, race, religion, residence, service connection, referral source, psychiatric and physical diagnoses, alcohol problems, number of admissions, medication, treatment, suicide attempts, length of stay, and condition at discharge. The processing of 625 admissions in 1968 used the following machines for the times indicated: IBM 029 Card Punch, 7.5 hr.; IBM 056 Card Verifier, 7.5 hr.; IBM 514 Reproducing Punch, 11 hr.; and IBM 1130 Computing System, 11.3 hr. One can obtain estimates of local costs for similar programs by using these figures as a guideline.—*R. Sivley.*

1393. **Shea, Marilyn C.** (Ohio State U.) **The differentiation of judgment.** *Dissertation Abstracts International*, 1970(Oct), Vol. 31(4-B), 2266-2267.

1394. **Solomon, Harry C.** (Harvard Medical School, Boston, Mass.) **Half a century of hospital psychiatry.** *Hospital & Community Psychiatry*, 1968(Dec), Vol. 19(12), 367-371.

1395. **Terl, Beatrice G.** (Baltimore Workshop for Retarded, Md.) **A dynamic work program for maximum-security patients.** *Hospital & Community Psychiatry*, 1968(Dec), Vol. 19(12), 381-383.—Describes a psychodynamically based work-for-pay program created to rehabilitate maximum-security male patients at a 300-bed state hospital. The program emphasizes graduated levels of responsibility, realistic working conditions, and group psychotherapy.

1396. **Treffert, Darold A.** (Winnebago State Hosp., Wis.) **Administering a residential program.** *Hospital & Community Psychiatry*, 1968(Aug), Vol. 19(8), 237-240.—Draws conclusions concerning child-adolescent units based on the author's experience as unit administrator and hospital superintendent. A list of program ingredients which have worked successfully at a state hospital are included. Program objectives, problems encountered, and staff guides are discussed.—*B. A. Burkard.*

PSYCHOANALYTIC INTERPRETATION

1397. **Aruffo, Roy N.** **Lactation as a denial of separation.** *Psychoanalytic Quarterly*, 1971(Jan), Vol. 40(1), 100-122.—Briefly reviews the medical and psychoanalytic literature on the problem of galactorrhea (or the abnormal secretion of milk in virgins or other nulliparous women), and presents an analytic treatment report of an adolescent girl. The psychogenic factors are evaluated.—*J. Z. Elias.*

1398. **Bychowski, Gustav.** (Mt. Sinai School of Medicine, New York, N.Y.) **Psychoanalytic reflections on the psychiatry of the poor.** *International Journal of Psycho-Analysis*, 1970, Vol. 51(4), 503-509.—Psychoanalytic theory originally was concerned with only the analytic situation and not with the impact of social-economic conditions external to that situation. Being middle class leads to inner flight (neurosis). Being

lower class leads to acting-out, unusual behavior, or outer flight. Poverty brings scarcity, lack of stimulation, and results in intellectual dullness, academic deficits, inarticulation, emotional isolation, depression, hopelessness, and apathy. These are all seen in the children of poverty. Hostile aggression is common and defies socialization. (17 ref.)—*J. Chyatte.*

1399. **Chertok, Leon.** (22 rue Legendre, Paris, France) **Freud in Paris: A crucial stage.** *International Journal of Psycho-Analysis*, 1970, Vol. 51(4), 511-520.—Breuer told Freud about Anna O. in 1882. 3 yr. later Freud went to Paris on a postgraduate scholarship. Here he learned hysteria was not malingering and that neurotic symptoms like hysteria were induced by ideas. Charcot used hypnosis to induce hysterical paralysis. Freud perceived the connection between hysteria and sexuality at that time. 10 yr. after leaving Paris, he postulated his theory connecting sex and neurosis. (22 ref.)—*J. Chyatte.*

1400. **Géahchan, Dominique J.** **Références métapsychologiques pour une psychothérapie des psychoses en milieu institutionnel.** [Metapsychological references for a psychotherapy of psychoses in an institution.] *Interprétation*, 1970(Jan), Vol. 4(1-2), 11-40.—Within the context of Freudian metapsychology, the close relationship between dreams and psychoses (transference, neurosis, schizophrenia, acute hallucination, etc. . . is analyzed and substantiated by the various works of Freud, including *The Interpretation of Dreams*, *The Unconscious*, *President Schreber*, *Introduction to Narcissism*, *Mourning and Melancholy*, and *Neurosis and Psychosis*. The metapsychological notions of narcissism, the instinct of death, and reality, and their interrelation with all psychoses are examined. It is concluded that the psychotic will always regress to a narcissistic state, reality will always be rejected, and the death instinct will continue to be a predominant factor of negation and division. Only desire will overcome all 3.—*S. Maze.*

1401. **Geba, Richard.** (Inst. for Psychoanalytic Training, New York, N.Y.) **Dostoevsky and "The Gambler": A contribution to the psychogenesis of gambling: II.** *Psychoanalytic Review*, 1970, Vol. 57(2), 289-302.—Reviews major psychoanalytic contributions to the subject of gambling and uses this review as a basis for analyzing Alexis, the gambler in Dostoevsky's novel. A primary determinant in the gambling impulse is the preoedipal mother. Hence, the oral components of the personality surge to the foreground. Through his powerful identity with his mother, the gambler imagines an immunity against loss; his storehouse is self-replenishing like the mother's milk. He also expects to satisfy his own insatiable hunger. 4 features in the psychogenesis of the gambler are traced: (a) the oedipal search for knowledge, (b) the giving and getting of secrets as an act of love, (c) the equation of secret and genitals, and (d) the need to incorporate the secret physically. The self-punishment and defeat of the gambler are viewed as paradoxical but unintended means to attain childhood hopes and dreams to win the mother's body. The masochistic pleasures and desires that accrue to that end are but secondary motivations. (29 ref.)—*D. Prager.*

1402. **Greenacre, Phyllis.** (501 E. 87th St., New York, N.Y.) **The transitional object and the fetish with special reference to the role of illusion.** *International Journal of Psycho-Analysis*, 1970, Vol. 51(4), 447-456.—Transition objects arise in infancy and are given up in latency; fetishes are manifested during latency or adolescence and remain a part of adult sexual activity.

The transition object can promote illusion or a misinterpretation of reality. It is a tangible sign of a changing relationship during a period of growth and maturation. It is given up by 4 yr. of age by reducing it in size, e.g., the security blanket or by its becoming a toy to be used at bedtime or during play. A fetish is detrimental to maturation and represents a perceived bodily defect.—J. Chyatte.

1403. Halverson, John. (U. California, Santa Cruz) **Amour and Eros in the Middle Ages.** *Psychoanalytic Review*, 1970, Vol. 57(2), 245-258.—Presents an outline of a tentative psychological approach to love in the medieval world, taking into account the historical dimension, and proceeding from Freud's later theoretical position on the instincts and the divisions of the psyche. (8 ref.)—D. Prager.

1404. Herbert, Edward T. (Northern Illinois U.) **Myth and archetype in "Julius Caesar."** *Psychoanalytic Review*, 1970, Vol. 57(2), 303-308.—Many critics have felt that *Julius Caesar* should have been called *The Tragedy of Brutus*. This argument loses force when the play is viewed as a myth and can be interpreted as a dramatization of an archetypal situation similar to that discussed by Freud in *Totem and Taboo*. Actions in the play which seem at 1st to be contradictory and inconsistent are seen to be natural and deeply rooted in the human psyche when viewed in the light of Freudian insights.—D. Prager.

1405. Kaplan, Donald M. (175 W. 12th St., New York, N.Y.) **Comments on the screening function of a "technical affect," with reference to depression and jealousy.** *International Journal of Psycho-Analysis*, 1970, Vol. 51(4), 489-502.—Freud indicated that screen phenomena are conscious attempts to embody and repress infantile experience. All memories are screen memories in that they retain and distort personal data. Cited are examples of "technical affect" where a patient exhibits 1 emotional stance in therapy and another in other spheres. To a patient depression is a mood with diluted fantasies. To a patient jealousy is a painful mood and has an element of "crazy." Screen depression results from trauma in the early years where "overprotection" is obvious. (42 ref.)—J. Chyatte.

1406. Krippner, Stanley & Easton, Harry K. (Maimonides Medical Center, Dream Lab., Brooklyn, N.Y.) **The essential theme in Jungian psychology.** *Journal of Contemporary Psychotherapy*, 1970(Sum), Vol. 3(1), 19-26.—Describes the contributions of Jung to existential psychology. Jung's analytic psychology is described as an open system utilizing intuition, clinical impressions, and flexible and changing hypotheses in a basically phenomenological approach to therapy. The individual is regarded as unique, and a transcendent approach emphasizing his ability to purposively change is the basis of Jungian therapy. Neurosis is regarded as a morbid development, and as the beginning of a creative development. The conscious and unconscious are considered to be 2 aspects of the psyche which must be integrated. The mutual involvement of the therapist and the patient in the therapeutic situation is emphasized. The patient in the therapeutic situation is described as 3 parts of a whole—existential anxiety in the realization of death is considered basic to the creation of a viable identity. It is concluded that Jung's writings merit more attention than they have received. (23 ref.)—S. Knapp.

1407. Lewin, Bertram D. **Metaphor, mind, and manikin.** *Psychoanalytic Quarterly*, 1971(Jan), Vol. 40(1),

6-39.—Examines the psychoanalytic use of the metaphor as exemplified frequently in Freud's writing with particular reference to the metaphoric concepts as to the "structure" of the mind.—J. Z. Elias.

1408. Lewis, Murray D. (U. Rochester, Medical School) **A superego distortion: The defensive use of expressions of moral concern.** *International Journal of Psycho-Analysis*, 1970, Vol. 51(4), 465-470.—Verbal expression of moral concern may be true expressions, a matter of expected convention, an indication of social anxiety, or an effort to appease others to ward off retaliation. The superego distortion helps defend one against a feeling of helplessness and gives a false sense of control.—J. Chyatte.

1409. Markle, Durward J. (Bellevue Psychiatric Hosp., New York, N.Y.) **Freud, Leonardo and the lamb.** *Psychoanalytic Review*, 1970, Vol. 57(2), 285-288.—In his study of Leonardo da Vinci, Freud states that the famous Mona Lisa smile is explainable in the light of Leonardo's mother-child relationship, and represents Leonardo's memory of the satisfaction he received as a child at his mother's breast and the love he found in her smiling gaze. Further he attributes the retained childhood feelings toward the mouth as also evident in other paintings, e.g., "The Holy Family." Freud's analysis is critically reviewed in light of Leonardo's childhood condition, with Leonardo being viewed as the child in "The Holy Family."—*Journal summary*.

1410. Mouján, Octavio F. (G. Aráoz Alfaro Polyclinic, Psychopathology & Neurology Service, Buenos Aires, Argentina) **Los rasgos de carácter en la pubertad y mediana adolescencia.** [Character traits in puberty and midadolescence.] *Acta Psiquiátrica y Psicológica de América Latina*, 1970(Sep), Vol. 16(3), 255-260.—Presents a psychoanalytic (Freudian) interpretation of characterological changes in puberty and midadolescence. During early adolescence, both men and women identify themselves with their parents of the opposite sex; this situation is later reversed and both achieve the proper identification. Clinical examples are provided.—V. A. Colotta.

1411. Muldworf, Bernard. **Psychanalyse et engagement.** [Psychoanalysis and commitment.] *Interprétation*, 1969(Jul), Vol. 3(3), 85-117.—Examines the psychodynamic genesis and structure of commitment, its psychology and psychopathology, and its relations with ideology and unawareness. Identification, sublimation, and the religious experience are explored as to their roles in the psychology, motivations, and psychological effect of militant commitment; the authority relation (father figure) is at the roots of "psychopathological commitment," as well as security-seeking in the group (mother figure), and passive and dependent submission; an objectively conflictual situation may enable 1 to grasp at the "solution" nature of political commitment; illusory, empirical, prospective, and functional knowledge are operant in ideology. Unawareness of deep motivations is present in the psychological unconsciousness of militant commitment, while at the ideological level one takes part in politics as the unconscious agent of structural laws which must lead to the necessary correspondence between production and productive relationships. 3 theories are discussed: (a) ideology is in a like manner constituent of social life as fantasy is constituent of individual life; (b) the metonymy of desire is in some manner the root origin of the collective

"imaginary"; and (c) commitment appears to be a new synthesis belonging to a specific order of reality—politics.—*T. N. Webster.*

1412. Pollock, George H. (Inst. for Psychoanalysis, Chicago, Ill.) **Temporal anniversary manifestations: Hour, day, holiday.** *Psychoanalytic Quarterly*, 1971(Jan), Vol. 40(1), 123-131.—Discusses the appearance of psychic symptoms on anniversaries or other temporal points through examples of a variety of cases. Psychoanalytic literature references to this subject are cited.—*J. Z. Elias.*

1413. Reid, Stephen A. (San Fernando Valley State Coll.) **A psychoanalytic reading of "Troilus and Cressida" and "Measure for Measure."** *Psychoanalytic Review*, 1970, Vol. 57(2), 263-282.—Suggests that the bitterness and futility in *Troilus and Cressida* were the result of Shakespeare's understanding that something in the sex drive made its absolute gratification improbable, and that this, in turn, was the source of futility in public action. Several years later, in *Measure for Measure*, Shakespeare felt that this inability of the sex drive to achieve absolute gratification could be turned into a partial positive by persuading men that limited satisfaction is the best.—*D. Prager.*

1414. Schafer, Roy. (Yale U.) **An overview of Heinz Hartmann's contributions to psychoanalysis.** *International Journal of Psycho-Analysis*, 1970, Vol. 51(4), 425-446.—Hartmann revised Freud's theories 5 ways. An attempt was made to dissolve its dualism by introducing the concept of degree, to choose the biological-adaptational vantage point as a framework for psychoanalytic theory, and to become its anatomist and bring preciseness and coherence by examining both its gross and fine aspects. Through use of the concept of neutralization, Hartmann refined Freud's psychoeconomic ideas. He made the mind analogous to the common idea of government and its duties. "Hartmann's contributions to psychoanalytic theory of increased orderliness, subtlety, and comprehensiveness have continued and even added to some difficulties, while diminishing or resolving others." (35 ref.)—*J. Chyatte.*

1415. Spielman, Philip M. (Mt. Zion Hosp. & Medical Center, San Francisco, Calif.) **Envy and jealousy: An attempt at clarification.** *Psychoanalytic Quarterly*, 1971(Jan), Vol. 40(1), 59-82.—Envy and jealousy, frequently interchanged, are examined for delineation as to meaning and psychoanalytic usage. It is concluded that envy involves 2 persons; jealousy, 3. The related psychodynamics are discussed.—*J. Z. Elias.*

PSYCHODIAGNOSIS

1416. ———. **Psychiatric disorders in the community.** *British Medical Journal*, 1970(May), Vol. 2(5707), 435.

1417. Albert, Gerald. (C. W. Post Coll., Long Island U.) **Sentence completions as a measure of progress in therapy.** *Journal of Contemporary Psychotherapy*, 1970(Sum), Vol. 3(1), 31-34.—Proposes the use of the Rotter Incomplete Sentences Blank as an index of therapeutic movement. Administered at well separated intervals, the completions would be judged for gain or loss in emotional health with a + or -. In addition to measuring improvement, the minus items would indicate for the therapist areas where attention is needed. Examples of responses of a 25-yr-old female who had had a schizophrenic break are presented. Good correlation was found between the improvement noted by this method and that indicated on MMPI scores. It is

suggested that this method may provide a highly dependable therapeutic instrument.—*S. Knapp.*

1418. Beenen, Folkert. (Wilhelmina Gasthuis Psychiatric Clinic, Amsterdam, Netherlands) **Psychiatric diagnosis and subjective probabilities.** *Acta Psychologica, Amsterdam*, 1970(Dec), Vol. 34(2-3), 328-337.—Investigated the possibility of improving the diagnostic process in clinical practice by using subjective probabilities. Subjective probability estimates of 11 clinicians were used in constructing diagnostic rules. Results of diagnoses of 25 patients suggest no real improvement over spontaneous diagnosing. Some limitations and implications of the study are discussed.—*Journal abstract.*

1419. Bernardi, Silvano & Rabassini, Aldo. **Considerazioni sull'importanza dell'psicodiagnostica con metodi proiettivi Rorschach e TAT nelle pseudonevrosi (casi Borderline).** [Considerations on the importance of psychodiagnostics with Rorschach and TAT projection methods in pseudoneurotic (borderline cases).] *Rivista di Psichiatria*, 1969(Sep), Vol. 4(5), 362-365.—Defined "borderline" as a form of psychosis which presents itself with a neurotic exterior. The essential characteristic is the weak ego. The lack of distinction between subject and object creates the psychotic situation. The Rorschach Test by way of the method of comprehension, of the detail of perceptive data shows how the ego is in contact with reality. The ambiguous stimulus represented by the spots in their color, form, and movement as well as the answers reveal the persistence of autistic thought and of narcissistic libido. The elements in the Rorschach Test which indicate a borderline structure are listed. The TAT, although more superficial regarding the personality, is of value. The tendency of the S toward autistic thinking and his narcissistic needs can be seen in the light of the social and family pressures to which the ego is subjected.—*A. M. Farfaglia.*

1420. Dobbs, Norman J. (Purdue U.) **Predicting length of psychiatric hospitalization using demographic and psychological test data.** *Dissertation Abstracts International*, 1970(Oct), Vol. 31(4-B), 2276.

1421. Dudley, Harold K., Williams, Jack D., & Overall, John E. (Rusk State Hosp., Tex.) **Relationships of Beta IQ scores to socio-cultural factors in a psychiatric population.** *Journal of Clinical Psychology*, 1971(Jan), Vol. 27(1), 68-74.—Beta IQ scores and 18 social history variables were recorded for a sample of 432 psychiatric patients. Significant sources of variations were: age, race, sex, history of previous psychiatric hospitalization, education, work, achievement, mental states, military and criminal records, and various clinical diagnostic groups. A formula is presented for estimating Beta scores using a combination of background characteristics. "The difference between actual performance and the performance that is expected for a patient with the particular background characteristics is proposed as a sensitive index of acute functional impairment."—*E. J. Kronenberger.*

1422. Hartlage, Lawrence C. (Indiana U., Medical Center, Indianapolis) **Differential diagnosis of dyslexia, minimal brain damage and emotional disturbances in children.** *Psychology in the Schools*, 1970, Vol. 7(4), 403-406.—Tested the efficacy of 3 tests (WISC, Bender Gestalt, and Wide Range Achievement Test—WRAT) in identifying 81 children who had been classified into the 3 classification categories (31 dyslexic, 25 minimally brain damaged, and 25 severely emo-

tionally disturbed; mean age, 9.8 yr.; mean WISC IQ, 101). The analysis indicates that the tests could not be used as a sole basis for classification, although the WRAT reading discrepancy score is a "possible instrument for superficial differentiation of the 3 diagnostic categories..."—H. Kaczowski.

1423. Herron, William G. & Psaila, Justin. (St. John's U., Jamaica, N.Y.) **Diagnosing children's problems.** *Psychology in the Schools*, 1970, Vol. 7(4), 397-403.—This review of diagnostic methods of children's problems points to the various limitations in each classification system. The efficacy of the proposed tri-axial approach (Clinical Syndrome \times Intellectual Level \times Etiological Factors) is discussed. (23 ref.)—H. Kaczowski.

1424. Hettema, P. J. & Wolke, M. Y. **Constructie van een progressieschaal voor T.B.R.-delinquenten.** [Construction of a progress scale for the adjustment of mentally disturbed delinquents.] *Gewein*, 1970(Nov), Vol. 18(7), 473-495.—Described improvement of mentally disturbed delinquents by 477 items. 31 Ss were rated twice at a 5-mo interval on a 5-point scale for each of these items by 3 raters. Discrepancy scores (over this period) were correlated with an overall adjustment rating, after 211 items were found to have reached reliability $d=.30$. In the last step, 165 items and the criterion score were cluster analyzed. 3 clusters emerged: (a) the 1st cluster, with 102 items, defined adjustment to the clinic norms, (b) the 2nd cluster, with 26 items, dealt with active participation in possible aspects of the unit, and (c) the 3rd cluster, with 16 items, dealt with independence and social isolation.—S. G. Vandenberg.

1425. Hunt, William A. & Walker, Ronald E. (Loyola U., Chicago, Ill.) **Cue utilization in diagnostic judgment.** *Journal of Clinical Psychology*, 1971(Jan), Vol. 27(1), 62-64.—13 PhD clinicians made a differential diagnosis of 305 Ss using WAIS Comprehension and Vocabulary test protocols. The clinicians performed better than chance but the performance was noted as poor with the 6 neurotic and 6 organic protocols. The amount of information processed seemed to be positively related both to correct choices and to first choices. There was a poor showing of diagnosis by exclusion.—E. J. Kronenberger.

1426. Koppel, Irwin & Farina, Amerigo. (U. Connecticut) **Hospitalization time and psychiatrists' perceptions of mental patients.** *Journal of Clinical Psychology*, 1971(Jan), Vol. 27(1), 59-61.—54 psychiatrists rated 3 typical case descriptions in which hospitalization time was systematically varied. Each judge was asked to give a diagnosis, specify 3 factors that influenced his decision, to indicate the patients' severity of disturbance and their own diagnostic confidence, and to suggest recommendations for treatment, discharge, or other disposition. Hospitalization time had a significant effect but varied with the characteristics of the case. Length of hospital stay appeared to influence recommendations for medication and the total number of psychiatric treatments.—E. J. Kronenberger.

1427. Lehman, Elyse B. & Levy, Bernard I. (George Washington U.) **Discrepancies in estimates of children's intelligence: WISC and human figure drawings.** *Journal of Clinical Psychology*, 1971(Jan), Vol. 27(1), 74-76.—Scores were obtained on 4 measurements for 72 boys: WISC, Human Figure Drawings (HFD), Holtzman Inkblot Technique, and the Height Estimation Test. Relationships between the WISC and HFD were low but discrepancies between the IQs were significantly greater in the disturbed than in the normal group. There

was inconsistent support for the body image hypothesis. Intelligence level was an important factor in discrepancies in estimates of children's intelligence.—E. J. Kronenberger.

1428. Misyuk, N. S. (Minsk Medical Inst., USSR) **Puti automatizatsii diagnosticheskogo protsesssa.** [Ways of automating the diagnostic process.] *Zhurnal Nevropatologii i Psikiatrii*, 1970(Apr), Vol. 70(4), 532-537.—Presents a logico-probability algorithm for the computer diagnosis of human disease, illustrated by the differential diagnosis of brain tumors in 632 patients and of acute cerebral dyscirculatory disturbances in 100 patients. Diagnostic exactness for the 2 groups was different and fluctuated within the limits of 80-90%. Automation of the diagnostic process is viewed as 1 of the ways of bringing about an improvement in the diagnosis and prognosis of disease. (English summary)—I. D. London.

1429. Obrzut, John E. & Thweatt, Roger C. (Northern Arizona U.) **Clinical differentiation with the spiral aftereffect technique.** *Perceptual & Motor Skills*, 1970(Dec), Vol. 31(3), 995-999.—Administered the spiral aftereffect (SAE) apparatus to 50 independently medically diagnosed organic patients and 50 normals matched in sex and age. Each S was given standard instructions for 6 trials of 30-sec exposure time. Variables, e.g., rate and direction of rotation, lighting intensity, and light adaptation, were controlled for all Ss. Scores and percentage computations of Ss in the various diagnostic groups indicate that the SAE test has significantly differentiated between cases of organic brain damage and normals ($p<.01$). No differences were shown between infectious vs. noninfectious organics and convulsive vs. nonconvulsive organics. However, there was a significant difference between pre and postnatal organics ($p<.01$). For the entire group there were 32% false negative classifications and 8% false positive classifications.—*Journal abstract*.

1430. Pierson, George R. (U. Oregon) **The High School Personality Questionnaire as a delinquency proneness assessment instrument.** *Description Abstracts International*, 1970(Nov), Vol. 31(5 B), 2964.

1431. Płużek, Zenonena. **Wartość diagnostyczna testu WISKAD-MMPI w zakresie nozologii psychiatrycznej.** [Diagnostic value of MMPI among psychiatric nosological groups.] *Roczniki Psychiatrii, Annuaire de Psychiatrie*, 1969 Vol. 11(4), 125-143.—Based upon Polish adaption of the MMPI developed for experimental purposes in the psychological laboratory of a psychiatric hospital in 1950. Differential diagnostic problems based on the data derived from the MMPI data are discussed (180 psychiatric cases and 200 normal individuals served as Ss). The objective devices consisting of different profiles are evaluated as to their value in differential diagnosis. (English summary)

1432. Purker, Gary W. & Smith, Roger C. (Comprehensive Care Center, Lexington, Ky.) **MMPI "cookbooks": Are rule relaxation and system combination procedures an answer to low classification rates?** *Journal of Clinical Psychology*, 1971(Jan), Vol. 27(1), 96-101.—Assessed the effects of combining 2 MMPI classification systems and applying 3 rule-relaxation methods upon profile classification rates in 179 inpatient and 258 outpatient males. Ambiguities in classification and disagreement with clinical judges increased as a function of the flexibility of the classification procedure. Rule relaxation and system combination did produce a substantial increase in the proportion of classifiable

MMPI profiles. "The benefits of the proposed modifications may not be sufficient to warrant their use when the problems associated with the application of such procedures are considered."—*E. J. Kronenberger.*

1433. Querol, Mariano. *Relaciones somato-psíquicas en medicina: Enfoque electroencefalográfico.* [Somatic-psychic relations in medicine: Electroencephalographic approach.] *Revista de Neuro-Psiquiatria*, 1970(Mar), Vol. 33(1), 7-10.—Discusses EEG data from a clinical viewpoint, noting that, aside from epilepsy, the EEG is not a valid method for a specific diagnosis. However, due to the marked differences between normal and abnormal EEGs among sane and mentally ill individuals, the EEG is considered to be a valuable orientation device for diagnostic criteria. It is also considered to be helpful in aiding diagnosis of severe and chronic organic-cerebral disorders. The influences of REM sleep and psychotropic drugs on EEG medications are discussed.—*P. Hertzberg.*

1435. Satz, Paul. (U. Kentucky) *A block rotation task and multivariate statistical procedure for the diagnosis of organic brain disorder.* *Dissertation Abstracts International*, 1970(Oct), Vol. 31(4-B), 2265-2266.

1436. Schwartz, Mark S. & Krupp, Neal E. (Mayo Clinic, Rochester, Minn.) *The MMPI "conversion V" among 50,000 medical patients: A study of incidence, criteria, and profile elevation.* *Journal of Clinical Psychology*, 1971(Jan), Vol. 27(1), 89-95.—Reviews previous studies regarding the 1-3/3-1 code of the MMPI. The incidence of this code designation in 50,000 medical patients is presented with 4000 profiles fitting this code pattern. 5 research questions are raised. Another part of this study, using 120 Mayo clinic patients, attempted to determine the medical diagnosis associated with 3 different elevations of the 1-3/3-1 profile. No significant differences were noted among the elevations.—*E. J. Kronenberger.*

1437. Smith, Roger C. & Porier, Gary W. (FAA, Civil Aeromedical Inst., Oklahoma City, Okla.) *Factors influencing administrative disposition of psychiatric patients.* *Journal of Clinical Psychology*, 1971(Jan), Vol. 27(1), 54-59.—Disposition and psychiatric diagnosis were highly correlated in a sample of 437 military servicemen at psychiatric facilities for 2 major military installations. There was an increasing likelihood of separation from the service with increasing severity of diagnosis. Disposition and MMPI diagnostic classification were correlated with psychiatric diagnosis. MMPI classifications were generally unrelated to demographic or patient status variables. It was noted that degree of emotional disorder is not necessarily a primary determinant of administrative disposition of psychiatric patients.—*E. J. Kronenberger.*

1438. Tutoo, D. N. (Ministry of Defense, Directorate of Psychological Research, New Delhi, India) *The performance of socially adjusted and socially maladjusted subjects on Gibson maze test.* *Indian Journal of Psychology*, 1970(Jun), Vol. 45(2), 165-174.—Studies the performance of socially adjusted and socially maladjusted Ss using the Gibson Spiral Maze Test, a psychomotor test. 200 Ss were selected consisting

of 100 socially adjusted, 50 socially maladjusted (antisocial characters), and 50 socially maladjusted (neurotic type). All Ss were 20-35 yr. of age, literate, males, in good health. The MPI and Raven's Progressive Matrices were administered to measure the intelligence of all Ss. The score difference between the 2 groups was found to be statistically significant. The MPI educational score between the 2 groups was found to be statistically insignificant. Performance of socially adjusted Ss using the Gibson test proved to be of a higher score, since the socially maladjusted Ss used up more time to complete the test trial. The Gibson test showed that the socially adjusted performed better than the neurotics but not significantly better than the criminals. It was found that the Gibson test "can be usefully employed for diagnostic purposes in Indian setting also."—*J. Halev.*

1439. Watson, Charles G., Laliberte, Michael, & Sellers, Howard. (Veterans Administration Hosp., St. Cloud, Minn.) *Personality correlates of DAP facial expression.* *Journal of Clinical Psychology*, 1971(Jan), Vol. 27(1), 115-117.—Draw-a-Person (DAP) facial expression ratings and symptom ratings were correlated to test the diagnostic utility of the DAP facial expression. The results were negative with only 3 of 80 r's significant at the .05 level. Interjudge agreement on the facial expression ratings was poor. It is suggested that facial expression ratings may be sufficiently lacking in objectivity as to render very questionable their utility in personality appraisal.—*E. J. Kronenberger.*

1440. Wimmers, M. F. *Factoranalytisch-onderzoek van de W.A.I.S. subtests bij psychiatrische patienten en alcoholici.* [Factor analysis of the W.A.I.S. for psychiatric patients and alcoholics.] *Gawen*, 1970(Nov), Vol. 18(7), 496-509.—WAIS subtest scores for 125 psychiatric patients and 125 alcoholics were separately factor analyzed and the resultant 2 matrices rotated to the varimax criterion. Factor I was verbal comprehension; Factor II was related to the performance tests and has been called perceptual organization by Cohen; and Factor III was a memory factor which was only well defined in the psychiatric Ss.—*S. G. Vandenberg.*

BEHAVIOR DISORDER

1441. Gozali, Joav & Simons, Pauline. (U. Wisconsin, Milwaukee) *Community mental health services or cities of refuse.* *Journal of Counseling Psychology*, 1971(Mar), Vol. 18(2), 177-179.—Discusses the relative merits of treating socially deviant persons in large isolated institutions or in community integrated, small residential centers. Before community mental health centers can serve the needs of urban deviants, however, ways must be found of helping communities reestablish themselves as fit places to live. Middle-class professionals designing these centers are serving only their own interests if they do not consider these problems and draw community residents into comprehensive planning for the future.—*Journal abstract.*

1442. Joos, J., Debuyst, C., & Sepulchre-Cassiers, M. (Center of Neurology & Medico-Psychological Studies, Brussels, Belgium) *Boys who run away from home: A Belgian study.* *International Journal of Offender Therapy*, 1970, Vol. 14(2), 98-104.—Presents a study of 20 15-18 yr. old adolescents who had run away from home and been brought to court for truancy. Responses to a set of 13-14 questions indicate that most Ss (a) had

wanted to leave home for good, (b) had some sort of plans, (c) had only superficial attachments to their families and homes, and (d) left home from dissatisfaction rather than defiance. The future of habitual adolescent absconders is discussed. It is suggested that an occupation which satisfies their desires for adventure and activity would stabilize them more than a life requiring great stability and routine. (French, German, & Spanish summaries)—*S. Knapp*.

1443. Kleu, G. (U. Marburg, Clinic of Neuro-psychiatry, W. Germany) **Palmomental reflexes in adolescents with behavior disorders.** *Psychiatria Clinica*, 1970, Vol. 3(6), 375-380.—The palmomental (PM) reflex has been described in connection with lesions in the CNS, patients with intoxications and metabolic diseases. An attempt was made to determine if a "higher fixation of the reflex [exists] which could point to a decreased adaptation ability of mesencephalic structures." The PM reflex was studied in 13 boy and 5 girl 9-17 yr. olds with abnormal behavior. "In 10 Ss no reflex response was observed, although the stimulation duration was maximal (20 msec.). Based on the results, it is concluded that the PM reflex in adolescents with behavior disorders shows no difference in its structure, habituation, and stimulus duration as compared to healthy adults.—*P. McMillan*.

1444. Robertello, Richard C. & Forbes, Sylvia F. (Long Island Consultation Center, N.Y.) **The treatment of masochistic character disorders.** *Journal of Contemporary Psychotherapy*, 1970(Sum), Vol. 3(1), 41-44. Proposes that the "treatment of the masochistic character must combine an analytic, etiologic uncovering approach with a more surface conscious reconditioning one." The masochistic patient is described as one whose thoughts are obsessed with negative self-conceptions, who lives in the past or the future. He often feels ill physically and this may be self-induced by drinking and over work. His unhappiness is evidenced in his total demeanor. 2 types of masochistic character are distinguished: (a) oral, rage against the mother for deprivation of love, directed against the self; and (b) anal, rage against the punitive and restrictive mother, directed against the self. The secondary gain is described as the important difference between masochism and other neurotic symptoms which has made it into a character trait. Treatment involves an attack on the character defenses in order to reveal the rage underneath, and a concomitant training and encouragement of the patient to fight his masochistic thinking and behavior. Masochism is regarded as an addiction which can only be cured by the combination of analysis and reconditioning.—*S. Knapp*.

Drug Addiction

1445. Abrahams, M. J., Armstrong, J., & Whitlock, F. A. (U. Queensland, Brisbane, Australia) **Drug dependence in Brisbane.** *Medical Journal of Australia*, 1970(Aug), Vol. 2(9), 397-404.—Examined the prevalence of drug-taking among 6 groups of individuals: medical and psychiatric inpatients and outpatients, medical and surgical inpatients and outpatients, patients attending a number of general practitioners' surgeries, and a group of healthy Ss attending a clinic for routine chest X-ray examination. About 500 people in each of 6 groups were interviewed and matched samples were drawn for intergroup comparison. A high prevalence of barbiturate

dependence and prevalence of amphetamine and narcotic dependence was found in all groups. A highly significant number of Ss in all groups showed varying degrees of dependence on common analgesic preparations. The most severely affected Ss were found in the 2 groups of psychiatric patients, who also had made attempts at suicide in the past. The small number of Ss who used analgesic drugs for purposes of suicide is noted. Greater care in the prescription of barbiturates and limits in the universal availability of common analgesic drugs are proposed.—*Journal abstract*.

1446. Whitlock, F. A. (U. Queensland, Brisbane, Australia) **The syndrome of barbiturate dependence.** *Medical Journal of Australia*, 1970(Aug), Vol. 2(9), 391-396.—Compared 100 female patients suffering from severe barbiturate dependence with 100 female psychiatric patients matched for age, and, as far as possible, for personality and diagnosis. It was found that (a) the common symptoms and signs of barbiturate dependence are often misdiagnosed or overlooked, and (b) the etiology of the condition is complex, but appears to be based on a susceptible personality being subjected to a variety of stressful experiences. Multiple operations (particularly gynecological operations), psychiatric illness, and bereavement were noted in the dependent Ss. It is concluded that the ready availability of barbiturate prescriptions indicates clearly that barbiturate dependence is largely an iatrogenic disorder. It is suggested that all medical practitioners become more aware of the hazards of long-term barbiturate ingestion and the early signs and symptoms of dependence. *Journal abstract*.

Alcoholism

1447. Bergel'son, N. M. & Raikhinshtein, V. Kh. (Novosibirsk Medical Inst., USSR) **Kliniko-élektro-éntsefalograficheskie paralleli pri épileptiformnom sindrome, vyzvannom tyazheloï khronicheskom alkogol'noi intoksikatsiei.** [Clinico-electroencephalographic parallels in the epileptiform syndrome, produced by severe chronic alcoholic intoxication.] *Zhurnal Nevropatologii i Psikhatrii*, 1970(May), Vol. 70(5), 731-736.—Reports results of clinical and EEG examinations of 40-25-55 yr. old chronic alcoholics with an epileptiform picture (36 in encephalopathic Stage II; 14 in Stage III with partial dementia) and a control group of 10 chronic alcoholics without such a picture. The data indicate that a distinct parallelism cannot be established between severity and form of the course of alcoholism, on the 1 hand, and, on the other, degree of changes in cerebral bioelectrical activity. Similarly, it is impossible to formulate clear-cut indices of EEG changes in 1 or another form of the epileptiform picture. However, in fully developed convulsive seizures, there is no doubt about (a) the existence of a cortical epileptogenic focus in the EEG in a considerable percentage of the cases, and (b) the presence of signs of especially severe intoxication: sharp reduction of amplitude of bio-potentials, gross disorganization of the basic rhythm, and the appearance of slow dysrhythmia. 3 types of changes in cerebral bioelectrical activity in alcoholism are distinguished and described. (English summary) (29 ref.)—*I. D. London*.

1448. Chernaenko, T. K. (Skvortsov-Stephanov Psychiatric Hosp. No. 3, Leningrad, USSR) **O sootnoshenii mekhanicheskogo i logicheskogo oposredovannogo**

zapominaniya u bol'nykh khronicheskim alkoholizmom II - III stadii i zdorovykh. [On the relationship of mechanical and logically mediated memorization in normals and chronic alcoholics in Stages II and III of alcoholism.] *Zhurnal Nevropatologii i Psikiatrii*, 1970(Sep), Vol. 70(9), 1349-1352.—Employed 61 chronic alcoholics and a control group of 30 normals (same age and educational level). For rote learning, 10 words were memorized; for meaningful learning, Luria's pictographic method was employed. No differences were detected in rote learning. A considerable decline in the capacity for meaningful, logically mediated memorization was observed in the alcoholics along with imprecision of reproduction. It is suggested that this is the result of not so much impairment of memory itself as a decline in all aspects of psychic activity (personality, set, attitude, selective attention, purposeful voluntary behavior). (English summary)—*I. D. London*.

1449. **Entin, G. M.** (Research Inst. of Psychiatry, Moscow, USSR) *Klinika i terapiya alkohol'nykh psikhovozov v pozhilom vozraste*. [Clinical picture and therapy of alcoholic psychoses in later years.] *Zhurnal Nevropatologii i Psikiatrii*, 1970(May), Vol. 70(5), 743-750.—Presents an analysis of the various forms of alcoholic psychoses, and suggested treatment based on observations of 347 60-86 yr. old alcoholics, 204 of whom were suffering from alcoholic psychoses. The following alcoholic psychoses were distinguished: (a) alcoholic deliria and acute alcoholic hallucinosis, (b) delusional and hallucinatory-paranoid psychoses, and (c) vascular and somatogenic psychoses superimposed on chronic alcoholism. The clinical picture and special forms of therapy for each of these groups are described. (English summary)—*I. D. London*.

1450. **Fisk, Claire B.** (Boston U., Graduate School) *Psychological dependence, perceptual dependence and the establishment of a treatment relationship among male alcoholics*. *Dissertation Abstracts International*, 1970(Nov), Vol. 31(5-B), 2981.

1451. **Frolov, B. S.** (Kirov Military-Medical Academy, Leningrad, USSR) *O sindromologicheskoi strukture beloi goryachki*. [On the syndromic structure of delirium tremens.] *Zhurnal Nevropatologii i Psikiatrii*, 1970(May), Vol. 70(5), 736-740.—Based on observations of 65 Ss with delirium tremens (DT), the structure and developmental features of its syndromes were studied as a function of gravity and duration of the psychosis. 3 stages of the course of delirium tremens are distinguished (initial, intermediate, terminal) along with 3 degrees of gravity for each stage (light, moderate, severe). The various syndromes, associated with each of the stages are described and analyzed. In Stage 1, withdrawal (dysphoric) syndrome; in Stage 2 syndrome of verbal hallucinosis, epileptiform reactions, delirious syndrome, hyperkinetic and musitating deliria, coma, oneirism; and in Stage 3 Korsakoff syndrome, residual delusion, residual hallucinosis, asthenic syndrome. (English summary)—*I. D. London*.

1452. **Libb, J. Wesley & Taulbee, Earl S.** (U. Alabama) *Psychotic-appearing MMPI profiles among alcoholics*. *Journal of Clinical Psychology*, 1971(Jan), Vol. 27(1), 101-102.—An MMPI test-retest procedure on 20 nonpsychotic alcoholics who initially appeared psychotic on the MMPI was utilized. Compared to a schizophrenic control, changes were evidenced in scales suggesting psychosis on a retest 21 days following evaluation. The results were interpreted as evidence for

delaying the testing until the alcoholic effects dissipate in recent excessive drinkers. —*E. J. Kronenberger*.

1453. **Moefes, S. M.** (Leningrad Psychoneurological Hosp. No. 2, USSR) *K voprosu ob alkohol'noi parafrenii*. [On alcoholic paraphrenia.] *Zhurnal Nevropatologii i Psikiatrii*, 1970(May), Vol. 70(5), 740-743.—Based on observations of 10 patients with alcoholic paraphrenia, an analysis of the structural features of this syndrome during the period of its formation is presented in order to understand the reasons for its extreme rarity in patients with alcoholic paranoid states. Only 2 groups of alcoholic paraphrenia are distinguished: (a) 1 characterized by the syndrome of mental (ideatory) automatism, and (b) 1 characterized by the syndrome of verbal hallucinosis. No delusional fantasizing was detected. (English summary)—*I. D. London*.

1454. **Smart, Reginald G. & Waller, Julian A.** (Alcoholism & Drug Addiction Research Foundation, Toronto, Ontario, Canada) *On alcoholics and their accidents*. *Journal of Safety Research*, 1969(Dec), Vol. 1(4), 170-178.—Presents an exchange between R. G. Smart and J. A. Waller on the accident rates of alcoholics when sober and the implications of further research in this area toward the development of effective countermeasures. Smart refers to the common assumption that the alcoholic's accidents result primarily from the heavy use of alcohol, and points out that the possibility that alcoholics may also have higher rates of accidents when sober has rarely been considered. 3 studies are cited containing data which suggest that the rates of sober accidents among alcoholics are far higher than expected. Waller's response, which questions the suggestion that the alcoholic's sober accident rate is greater than that of other groups of drivers, includes a discussion of the interaction of pharmacological and personality factors in the crash rates of alcoholic drivers and an estimate of their driving exposure while impaired by alcohol. A further response by Smart is included. —*Journal abstract*.

Suicide

1456. **Brown, Timothy R.** (U. Oregon) *The judgment of suicide lethality: A comparison of judgmental models obtained under contrived versus natural conditions*. *Dissertation Abstracts International*, 1970(Nov), Vol. 31(5-B), 2978.

1457. **Lester, David.** (Suicide Prevention & Crisis Service, Buffalo, N.Y.) *Suicide and sibling position*. *Journal of Individual Psychology*, 1970(Nov), Vol. 26(2), 203-204.—Studies since 1966 "offer some support for the Adlerian hypothesis of greater frequency of suicidal behavior among first borns or last borns as compared to middle borns." (15 ref.)—*A. R. Howard*.

1458. **Lipmanov, R. G.** (Crimean Medical Inst., Simferopol, USSR) *Kliniko-statisticheskaya kharakteristika psikhicheskoi bol'nykh s suitsidal'nymi deistviyami*. [Clinico-statistical characteristics of the mentally ill displaying suicidal behavior.] *Zhurnal Nevropatologii i Psikiatrii*, 1970(Sep), Vol. 70(9), 1365-1368.—Presents a statistical study of mentally ill men and women (201 and 183, respectively), displaying

suicidal behavior (successful and unsuccessful). The highest rate of suicidal behavior was encountered in the 30-45 yr. age group. Sex differences were not significant. The ratio of successful to unsuccessful suicidal behavior is 1.4:1. The diagnostic breakdown was: schizophrenia (63.5%), involuntional psychoses (11.46%), alcoholic psychoses (9.9%), epilepsy (3.65%), vascular psychoses (3.13%), reactive psychoses (2.6%), and other groups (5.7%). The highest rate of suicidal attempts occurred in the 1st mo. following hospital discharge. The longer the lapse of time following discharge and the longer the duration of the mental disorder, the lower the rate of suicidal attempts. In the clinical picture the depressive or depressive-paranoid syndrome appeared as the common syndrome. (English summary)—*I. D. London.*

1459. Pelipas, V. E. (Central Research Inst. of Forensic Psychiatry, Moscow, USSR) **Nekotorye klinicheskie aspekty suitsidal'nykh tendentsii u psikhopaticheskikh lichnostei.** [Some clinical aspects of suicidal tendencies in psychopathic personalities.] *Zhurnal Nevropatologii i Psikhiatrii*, 1970(Jun), Vol. 70(6), 914-919. — Presents an analysis and discussion, based on the materials of the Serbskii Institute of Forensic Psychiatry, Moscow, on their "forensicopsychiatric evaluations" of suicides, committed in 1956-1967, among psychopaths. (English summary)—*I. D. London.*

1460. Rosselli, Humberto. (Colombian Inst. of Nervous System, Bogotá) **Modalidades del suicidio en Colombia.** [Suicide's characteristics in Colombia.] *Acta Psiquiátrica y Psicológica de América Latina*, 1970(Sep), Vol. 16(3), 244-254. — Reports an analysis of 379 cases of suicide published in 14 Colombian newspapers from August 1967-July 1968. The main finding was that most suicides took place in the industrialized areas of the country with a higher incidence among young women. The reactions of the newspapers to the suicidal cases are also described; preventive aspects of suicide are discussed. (28 ref.)—*English summary.*

1461. Whitlock, F. A. & Broadhurst, A. D. (U. Queensland, Brisbane, Australia) **Attempted suicide and the experience of violence.** *Journal of Biosocial Science*, 1969(Oct), Vol. 1(4), 353-368. — Reviews some of the literature on the interrelationships between suicidal acts, accidents, surgical operations, and other forms of violent experience. It was postulated that persons making suicidal attempts would, more commonly than non-suicidal controls, have encountered violent experiences. To test this, 50 persons attempting suicide were compared with 50 non-suicidal psychiatric patients and with 50 healthy persons attending a chest clinic. Groups were matched for age, sex, and social class. Data from a questionnaire were recorded. Classes of violent experience were graded numerically on a basis of severity and degree of responsibility. It was found that suicidal Ss had significantly higher violence scores than either control group, a finding which remained significant when previous suicidal attempts were excluded from the score. (22 ref.)—*Journal summary.*

Crime

1462. Brodsky, Stanley L. (Southern Illinois U.) **The prisoner as agent of attitude change: A study of prison profiles' effects.** *British Journal of Criminology*, 1970(Jul), Vol. 10(3), 280-285. — Investigated 1 of the often-cited goals of the prisoner-speakers programs, i.e., if youth attitudes toward the punishment of criminals

and attitudes toward prisons were modified as a result of being exposed to the programs. The issue of prison profiles as a deterrent to criminal behavior was not tested. An appropriate testing of this issue would require the use of experimental groups exposed to the prison profiles and control groups, as well as follow-ups and establishment of criteria of criminality. For the present study only a small sample of behavior, i.e., attitudes, was studied, and this under some relatively limited conditions. There were other factors present, such as being in the prison itself, being part of a tour, and, in the case of the students, being part of a class. It is suggested that the present study represents a first step towards quantifying the effects of this widely spreading phenomenon of prisoner-speaking groups. Considerably more research is needed to understand behavioral as well as attitudinal change in different audiences and in varying kinds of presentations.—*Journal summary.*

1463. Chaplin, James P. (St. Michael's Coll.) **The presidential assassins: A confirmation of Adlerian theory.** *Journal of Individual Psychology*, 1970(Nov), Vol. 26(2), 205-212. — Reviews the common characteristics of 9 persons who assassinated or attempted to assassinate United States' Presidents and finds confirmation for Adlerian theory.—*A. R. Howard.*

1464. Cohn, Rebecca R. (U. Oklahoma) **The Tennessee Self Concept Scale as a differentiator of delinquent female subgroups.** *Dissertation Abstracts International*, 1970(Nov), Vol. 31(5-B), 2979.

1465. Hoghugh, M. S. & Forrest, A. R. (Aycliffe School, Darlington, Scotland) **Eysenck's theory of criminality.** *British Journal of Criminology*, 1970(Jul), Vol. 10(3), 240-254. — Attempts to present new evidence which bears on the validity and usefulness of Eysenck's theory applied to persistent young offenders. In the process, certain methodological aspects of testing Eysenck's theory were also touched on. The studies provide several points for discussion. The results consistently suggest that, contrary to prediction from Eysenck's theory, persistent young offenders are significantly more introverted than the normative samples or selected control groups. Furthermore, extroversion, as measured by these tests, appears to be a poor correlate of difficult behavior which is unresponsive to the normal reward and punishment strategies used for ensuring acceptable behavior in residential settings. It is concluded that according to the normal criteria for acceptance of a theory to which Eysenck also subscribes, his theory of criminality has been "falsified." Doubts may be raised regarding the samples, the tests, and the methods of analysis.—*Journal summary.*

1466. Mattocks, Arthur L. & Spencer, Verlin. (California Medical Facility, Vacaville) **A correlational study of the dependency-proneness of prison inmates and membership in social clubs.** *Journal of Clinical Psychology*, 1971(Jan), Vol. 27(1), 48-50. — Prison inmates who belonged to inmate clubs tended to have a greater degree of dependency-proneness than non-members. The nature of the club contributed to dependency-proneness of its members. A more supportive club attracted more members than a competitive activity-oriented one.—*E. J. Kronenberger.*

1467. Plummer, Jack M. (Texas Tech U.) **A comparison of successful and unsuccessful vocational rehabilitation clients from a reformatory population.** *Dissertation Abstracts International*, 1970(Nov), Vol. 31(5-B), 2964-2965.

1468. Soltz, William H. (U. Missouri, Columbia) **Comparative study of Negro-white differences on the MMPI and PAS.** *Dissertation Abstracts International*, 1970(Nov), Vol. 31(5-B), 3009.

1469. Warder, John; Presley, Allan S., & Kirk, Joan. (Royal Edinburgh Hosp., Scotland) **Intelligence and literacy in prison and hospital populations.** *British Journal of Criminology*, 1970(Jul), Vol. 10(3), 286-287.—Evidence is presented in the form of Progressive Matrices and Mill Hill Vocabulary scores which indicates a significantly lower level of literacy or reading ability in a prison population than in a psychiatric hospital population which is comparable in terms of intelligence. It is suggested that low literate forms of verbal tests should be used in studies of prisoners.—R. Gunter.

Juvenile Delinquency

1470. Bruce, Nigel. (U. Edinburgh, Scotland) **Delinquent and non-delinquent reactions to parental deprivation.** *British Journal of Criminology*, 1970(Jul), Vol. 10(3), 270-276.—The valuable evidence collected helps to confirm what so many caseworkers believe on the basis of experience, that delinquency is rooted in the general pathology of the family. Criminological research has in the past had an inadequate supply of reliable information about relationships within families in the population at large. In the last 20 yr., however, population surveys which contain more personal detail than the National Census have become more feasible and their value has been better appreciated. The little-studied field of the deprived child who does not turn delinquent was examined in a recent small-scale research in Eastern Scotland. The delinquent sample consisted of 36 boys and 14 girls in local approved schools who had at some time been in the care of local authorities for periods of time totaling more than 6 mo. The delinquent sample was the total of those children who satisfied the criteria in 6 approved schools in Eastern Scotland. The comparison group was selected at random up to an equal number. 11 random selections had to be rejected: 6 were untraceable, 1 declined to cooperate, 2 had been committed to approved schools, and 2 had been accepted so totally into the extended family at such an early age that the separation experience was not likely to have been traumatic. A further 11 were selected randomly to replace them, using the same criteria.—*Journal summary.*

1471. Cowden, James E., Schroeder, Charles R., & Peterson, William M. (Wisconsin Dept. of Health & Social Services, Madison) **The CPI vs. the 16 PF at a reception center for delinquent boys.** *Journal of Clinical Psychology*, 1971(Jan), Vol. 27(1), 109-111.—Compared the results of the CPI and the 16 PF in terms of their ability to classify boys within a juvenile correctional institution into subgroups differing in adjustment. Although the CPI was noted as the superior instrument, the 16 PF had some advantages over the CPI as a large-scale screening device.—E. J. Kronenberger.

1472. Gibson, H. B. (Polytechnic, Hatfield, England) **The factorial structure of juvenile delinquency: A study of self-reported acts.** *British Journal of Social & Clinical Psychology*, 1971(Feb), Vol. 10(1), 1-9.—An individually administered test of self-reported delinquency was given to 402 14-15 yr. old boys, following pilot work published earlier. Results were analyzed factorially and related to a measure of social handicap

on which the Ss were rated previously, and to the Ss' records of criminal conviction. A large general factor of delinquency and several specific factors were found. The general factor was related to social handicap and criminal conviction, but the specific factors showed differences in their relations to these 2 social variables. 2nd-order factors were also extracted and the 1st 2 generated a hypothesis concerning the interaction of handicap and conviction which was tested empirically on the data. (16 ref.)—*Journal abstract.*

1473. LaFon, Dorothy N. & Rousey, Clyde L. (Wailuku Health Center, Maui, Hawaii) **Residues of early father-child conflict.** *Journal of Nervous & Mental Disease*, 1970(May), Vol. 150(5), 366-370.—Studied 80 9-18 yr. old delinquent boys, to determine if the presence of the substitution of the "f" sound as in "feet" for the voiceless "th" sound as in such words as "both," "bathtub," or "thanks" was related to disturbances in paternal-child relationships. Ss were given the Templin-Darley Test of Articulation. Analysis of the data supports the view that such a relationship is probable.—*Journal abstract.*

1474. O'Keefe, Edward J. (Fordham U.) **Impulsivity and its relationship to risk taking.** *Dissertation Abstracts International*, 1970(Nov), Vol. 31(5-B), 3000.

1475. Romano, Robert J. (Boston U., School of Education) **Counseling outcomes related to family background of delinquent male adolescents.** *Dissertation Abstracts International*, 1970(Nov), Vol. 31(5-B), 3004-3005.

1476. Smith, Nathaniel C. (Ohio State U.) **A comparison of short-form estimation methods in the WISC in juvenile public offenders.** *Journal of Clinical Psychology*, 1971(Jan), Vol. 27(1), 77-79.—WISC protocols were rescored with 5 short form-estimation methods. The data analysis revealed: (a) there were significant differences between the short form and Full Scale IQs in the estimation methods; (b) 3 significant sex differences in short form IQs; (c) validity coefficients in the high 80s and low 90s with no sex differences; (d) a great majority of the Ss were placed within 1 Wechsler classification of their Full Scale IQ by the short forms; (e) significant differences for both sexes in mean IQ discrepancy scores for the various estimation methods; and (f) when 4 or more subtests were employed, 75% of the cases fell within ± 10 IQ points of their Full Scale IQ. It is suggested that potential users of WISC short forms determine which method is most appropriate for their population.—E. J. Kronenberger.

Homosexuality & Sexual Deviation

1477. Hoffman, Martin. (Health Dept., Center for Special Problems, San Francisco, Calif.) **Homosexual.** *Psychology Today*, 1969(Jul), Vol. 3(2), 43-45, 70.—Male homosexuals are not necessarily ill and many studies have shown that psychiatrists cannot differentiate them from heterosexuals using life history and psychometric data. There are, however, some connections between homosexuality and psychopathology. The psychological disorders are related to reaction formation, incorporative wishes toward the male, and the shallowness of the relationships. Sociological pressures are actually more serious than the psychological disorders. The general hostility toward homosexuals forces them to accept the stigma and to adopt desperate, self-condemnatory attitudes.—E. J. Posavac.

3(1), 13-17.—Argues against the position of T. S. Szasz that the concept of mental illness is a myth. While certain points made in Szasz' book are considered to have value, e.g., the desire to end sentimentality and stiffen demands on the patient for honesty and improvement, the idea that all human activity is composed of games is not. Psychosis, delusions, and panic terror are considered as forms of mental illness which cannot be thought of as games. "Something evidently is very much the matter with the patient even if 'mental illness' is a myth."—S. Knapp.

1483. Degand, J. (Catholic U., Louvain, Belgium) Les fondements théoriques du non-directivisme rogerien dans ses rapports avec la psychologie pathologique. [Theoretical foundation of the Rogerian nondirectivism in its relations to pathological psychology.] *Bulletin de Psychologie Scolaire et d'Orientation*, 1970 (Jun), Vol. 19(2), 63-78. Basing arguments on the conceptions of C. R. Rogers' adaption-inadaption theory, and quoting liberally from the work of Rogers, the reality behavior of normal people is compared with the individual capacities in pathological patients, especially the capacities of conscious recognition and or reorganization notions. It is argued that, in mental diagnostics, the psychologist should not adapt a nosological viewpoint. In serious psychological situations of abandonment and paranoia, an indirect approach is recommended. This approach would maintain a prolonged contact with the patient and make it possible to introduce some modifications of perception, indicative of a certain capacity of the patient, which is generally denied to exist in such cases. (English summary) (24 ref.)—P. von Taal.

1484. Frighi, Luigi. **Approccio terapeutico multi-professionale alle problematiche dello studente universitario pseudoneurotico.** [Multiprofessional therapeutic approach to the problems of the pseudoneurotic university student.] *Rivista di Psichiatria*, 1969(Sep). Vol. 4(5), 373-376. Organized a psychopedagogical-social team to cope with the problems of borderline university students. During 5 yr., 8000 students were observed, a high percentage of whom had psychic disturbances. The psychopathological gamma extended from light personality disturbances (hyperemotion, anxiety) to the more serious schizophrenic psychosis. 50% of the Ss classified as psychotic were considered borderline averaging 20 yr. Intellectual inhibition was a frequent symptom at the beginning of a psychosis (difficulty of attention and concentration); in borderlines this inhibition is constant or occurs at exam time, etc. Where forced intellectualization was a defense against the "psychotic invasion" its sudden cessation represents the "imminent catastrophe on the fragile ego." Rarely, however, does this inhibition reach the aspects of pseudoweakness, as can occur in the evolutive forms of the schizophrenia. In order to reach a pedagogical balance, the students were given the help of professionals: (a) student assistants guided by psychiatrists and psychologists, and (b) social assistants who were helpful in making the parents aware of the student's illness. —A. M. Farfaglia.

1482. **Brand, Millen.** Is mental illness a myth?
Journal of Contemporary Psychotherapy, 1970(Sum), Vol.

clinical records of borderline students were examined. 23 (53.5%) had sexual problems. Sexual disturbances were divided into 3 categories according to the degree of severity: minor, average, and serious. 13.1% of the entire student population had sexual problems. There was a greater incidence of sexual disturbances in the borderlines compared to the entire student population. In the borderline Ss 26.3% had minor sexual disturbances; 30.4%, average; and 43.5%, serious. In the student population, 38.3% had light disturbances; 51.6%, average; and 10.6%, serious. Thus, serious sexual disturbances are more common in borderlines. The chaotic organization of the sexual characteristic of these borderline Ss is associated with a detached sadistic and sadomasochistic behavior. Among secondary symptoms of the borderline schizophrenics are pananxiety, panneurosis, and pansexuality. Borderlines are generally indifferent about their sexual problems.—A. M. Farfaglia.

1486. Giberti, Franco & Rossi, Romolo. **Profilo clinico e dinamico delle sindromi pseudoneurotiche.** [Clinical and dynamic profile of pseudoneurotic (borderline) syndromes.] *Rivista di Psichiatria*, 1969(Sep), Vol. 4(5), 341-349.—Studied the term "borderline" which can be equivocal with repercussions on a therapeutic level, especially when used to replace diagnostic uncertainty. On a clinical level "borderline" involves many neurotic aspects which are mixed together chaotically and which form a neurotic syndrome that is polymorphous in nature. It is an uncomfortable combination of psychotic, neurotic, and characteral disturbances with many elements of normality and good health. A general borderline syndrome is characterized by 4 elements: anger, lack of affection in relationships, lack of self-identity, and depressive isolation. In this light, 4 groups can be identified: (a) psychotic border, (b) central borderline group (anxiety, anger, solitude, depression), (c) individuals who lack affection, and (d) neurotic border. A common dynamic component in "borderline" is the presence of neurotic structures and mechanisms with a weak, immature, archaic ego underneath. (41 ref.)—A. M. Farfaglia.

1487. Goldberg, D. P. & Blackwell, B. (Inst. of Psychiatry, General Practice Research Unit, London, England) **Psychiatric illness in general practice: A detailed study using a new method of case identification.** *British Medical Journal*, 1970(May), Vol. 2(5707), 439-443.—Gave a self-administered questionnaire, the General Health Questionnaire, aimed at detecting current psychiatric disturbance to 553 consecutive attenders to a general practitioner's surgery. A sample of 200 of these patients was given an independent assessment of their mental state by a psychiatrist using a standardized psychiatric interview. The "conspicuous psychiatric morbidity" of a suburban general practice assessed by a general practitioner who was himself a psychiatrist and validated against independent psychiatric assessment was found to be 20%. "Hidden psychiatric morbidity" was found to account for 1/3 of all disturbed patients. When 87 patients who had been assessed as psychiatric cases at the index consultation were followed up 6 mo. later, 2/3 of them were functioning in the normal range. Frequency of attendance at the surgery in the 6 mo. following index consultation was found to have only a modest relationship to severity of psychiatric disturbance. It is argued that minor affective illnesses often accompany

physical complaints and usually have a good prognosis. (25 ref.)—*Journal abstract.*

1488. Holland, Jimmie; Masling, Joseph, & Copley, Donald. (State U. New York, Buffalo) **Mental illness in lower class normal, obese and hyperobese women.** *Psychosomatic Medicine*, 1970(Jul), Vol. 32(4), 351-357.—48 white women who were attending medical clinics for reasons other than obesity or psychiatric illness were interviewed for 2 hr., using Spitzer's Mental Status Schedule and a specialized medical history. The patients were then divided into 3 groups according to weight (normal, obese, and hyperobese). Results showed no significant differences in psychiatric disturbance among the 3 groups. Data based on specialized medical history showed that obese groups could be distinguished from the normal group by their eating when anxious, depressed, and not hungry, having a higher preferred weight, being more often head of household, delivering a child with birth weight over 9 lb., and reporting a husband underweight. (22 ref.)—W. G. Shipman.

1489. Mayo, Clara; Havelock, Ronald G., & Simpson, Diane L. (Boston U.) **Attitudes toward mental illness among psychiatric patients and their wives.** *Journal of Clinical Psychology*, 1971(Jan), Vol. 27(1), 128-132.—Compared the attitudes of wives with those of husband-patients and staff for general authoritarianism, authoritarian mental health attitudes, and antipsychological view of patient's illness. Results suggest that husband and wife held similar positions within a general attitude domain of authoritarianism. Wives were more similar to staff in attitudes toward mental illness, rated themselves higher than patients on a semantic differential scale, and generally shared the patient's physical as opposed to psychological orientation toward symptoms, causes, and treatment.—E. J. Kronenberger.

1490. Plotnik, Michaelene, M. (U. Florida) **An evaluation of the role of social competence in self-image disparity.** *Dissertation Abstracts International*, 1970(Nov), Vol. 31(5-B), 3003.

1491. Prats Homs, J. (U. Barcelona, Hosp. Clinic, Spain) **Acción de los psicofarmacos sobre la percepción taquistoscópica.** [Activity of psychopharmacology on tachistoscopic perception.] *Anuario de Psicología*, 1969, Vol. 1, 15-24.—Tested tachistoscopic perception in 48 Ss with nervous hypertension (high level of functioning), 20 Ss with melancholia (low level of functioning), and 10 normal controls. Ss were tested under the influence of (a) sedatives—chlordiazepoxide (librium), luminal, and oxazepam; and stimulants—amphetamine (benzedrine), dimethylimipramine, and pemoline. Tachistoscopic perception improved for the hypertension Ss on sedatives and for the depressive Ss on stimulants. Normal Ss followed the pattern of the depressives, but to a much less degree of intensity, i.e., tachistoscopic perception was augmented by stimulants and decreased by sedatives.—P. Hertzberg.

1492. Puoti, Mario M. **Definizione di "stati borderline" e cultura.** [Definition of borderline states and culture.] *Rivista di Psichiatria*, 1969(Sep), Vol. 4(5), 388-391.—In psychology the term "borderline" is the boundary between normality and intellectual deficiency; in psychiatry, it is the boundary between normality and pathology, or between neurosis and psychosis; in sociology, it is the boundary between normality and dissociation. It is used in all situations when a boundary must be established between 2 states characterized by elements present in both states. In some writings it is

used freely to express a failure of behavioral realization; in other writings it indicates a very precise phenomenon and denotes psychopathological types which are difficult to categorize. It is studied as the clinical entity as a boundary (a) with the norm, (b) with neurosis, (c) with psychogenic psychosis, and (d) with psychopathology. The relationship between this psychopathological phenomenon and cultural structure is also studied.—A. M. Farfaglia.

1493. Saavedra, Victor. (Santa Clara Clinic, Lima, Perú) **El desarrollo histérico y su posibilidad nosográfica.** [Hysterical development and the possibility of its disease classification.] *Revista de Neuro-Psiquiatría*, 1970(Mar), Vol. 33(1), 45-52.—Examines the pathogenesis of the development of a hysterical personality. Theories of a defective ego (involving a "forgotten ego") and of an over-abundant ego are discussed in relation to the hysterical personality. Case histories of a 22-yr-old female and a 37-yr-old male, respectively, diagnosed as hysterical-hypochondriacal and hysterical, support the theory of a defective ego development, hyperemphilia, which considers that there is an affective basis for the development of hysterical personality. —P. Hertzberg.

1494. Shternberg, E. Ya. & Rokhlina, M. L. (USSR Academy of Medical Sciences, Inst. of Psychiatry, Moscow) **Nekotorye obshchie klinicheskie osobennosti depressii pozdnego vozrasta.** [Some general clinical features of depressions in later years.] *Zhurnal Nevropatologii i Psikiatrii*, 1970(Sep), Vol. 70(9), 1356-1364.—Presents results of 4-yr observations of 205 men and women over 50 yr. old, suffering from different depressive states, with $\frac{2}{3}$ experiencing morbid depression for the 1st time subsequent to their 50th yr. In most cases the diagnosis was late endogenous depression. 7 types of depressive syndromes were distinguished, typical for the various periods of later life. Correlations are presented between (a) features marking the symptomatology of the late depressions; and (b) nosological diagnosis, age at onset of the depression, and the form of its development. 3 types of development were distinguished: circular, periodic, and single depressions. Prognoses for late depressions were relatively unfavorable; almost $\frac{1}{2}$ displayed residual effects and 18% of the cases assumed a chronic course. (English summary) (31 ref.)—I. D. London.

1495. Stein, Eugene. (U. Minnesota) **Ego-resiliency, ego-control, and risk taking in psychiatric patients.** *Dissertation Abstracts International*, 1970(Nov), Vol. 31(5-B), 3010.

1496. Weckowicz, T. E., Cropley, A. J., & Muir, W. (U. Alberta, Edmonton, Canada) **An attempt to replicate the results of a factor analytic study in depressed patients.** *Journal of Clinical Psychology*, 1971(Jan), Vol. 27(1), 30-31.—Hamilton's procedure of factor analysis of the scores on a rating scale of depressed symptoms was replicated using 52 depressed depressed patients. The obtained result, when compared with Hamilton's data, indicated very little similarity. "It is to be hoped that future studies may establish an invariance of factors in depression obtained on a broader basis of measures and bigger samples of Ss than those used in Hamilton's original study." —E. J. Kronenberger.

1497. Weinberg, H., Walter, W. Grey, & Crow, H. J. (Simon Fraser U., Vancouver, British Columbia, Canada) **Intracerebral events in humans related to real and imaginary stimuli.** *Electroencephalography & Clinical Neurophysiology*, 1970(Jul), Vol. 29(1), 1-9.—Re-

cordings were made from gold intracerebral electrodes in orbital and cingulate cortex and subdural electrodes on superior frontal cortex in 5 patients under treatment for chronic obsessional and anxiety disorders. Ss were instructed to guess whether or not they would receive a stimulus in the form of a flash, click, or electric shock to the finger. They were told to move a lever to the right when they expected a stimulus and to the left when they did not. A reward was offered for every 3 successive correct guesses. Sets of averages of 8 trials each were collected in 4 conditions: expectation-occurrence, expectation-nonoccurrence, no expectation-occurrence, no expectation-nonoccurrence. Averages were also taken of responses to random stimuli and of intrinsic activity when the lever was moved without guessing or stimuli. Clear cerebral events, termed "emitted potentials," were observed when stimuli were expected but did not occur. The emitted potentials resembled those evoked when real stimuli were presented on switch closure, suggesting that they may reflect memory processes corresponding to the perception of real events. In some experiments the latency of the emitted potentials was significantly shorter than that of responses evoked by real random stimuli, suggesting a rise in cortical excitability with expectancy. A positive deflection peaking at about 300 msec often appeared following switch closure, particularly with expectancy, and a negative variation usually preceded and accompanied this action. (French summary) *Journal summary*.

Neurosis & Emotional Disorder

1498. Altamirano, Guillermo; Berdicewski, Olga; Gomberoff, Mario, & Nazul, Ramsa. (Chile Santiago) **Influencia de la interacción padres-niños en la neurosis infantil: Alimentación.** [Influence of parents-children interaction in child neurosis: Feeding.] *Acta Psiquiátrica y Psicológica de América Latina*, 1970(Sep), Vol. 16(3), 221-233.—Studied maternal attitude during nursing and rearing by interviewing the mothers of 20 neurotic children and 20 normal children. Differences between the 2 groups were observed with respect to the mother's attitude toward the various aspects of feeding. Mothers of neurotic children demonstrated greater anxiety during breastfeeding, were more severe during weaning, and stricter in the handling of feeding problems. When infants, neurotic children tended to be more avid and restless while sucking, to react more strongly to weaning, and to present greater feeding problems. In actual feeding methods as such, no differences were observed between the 2 groups of mothers. (16 ref.) —English summary.

1499. Bourne, Peter G. **Psychological aspects of combat.** In H. S. Abram (Ed.), "Psychological aspects of stress." (See PA, Vol. 46 Issue 1) 70-85.

1500. Egeland, Byron & Halperin, Silas. (Syracuse U.) **A factor analysis of the elementary level of the California Test of Personality.** *Journal of Clinical Psychology*, 1971(Jan), Vol. 27(1), 105-108.—The California Test of Personality (CTP) was administered to 60 acting-out 5th grade boys. 2 interpretable factors emerged from a correlation matrix and factor analysis: self-esteem and feelings of competence, and social conformity. Since these 2 factors underlie the 12 scale scores, it is suggested that the use of all 12 scale scores is

unnecessary and that the 2 factor scores could replace the 12 scale scores. The total adjustment score was noted as being unjustified.—*E. J. Kronenberger.*

1501. **Girich, Ya. P.** (2nd Moscow Medical Inst., USSR) **Ob osobennostyakh sindroma psikhogennoi depressii u detei.** [On features characterizing the syndrome of psychogenic depression in children.] *Zhurnal Nevropatologii i Psikiatrii*, 1970(Oct), Vol. 70(10), 1548-1552.—Observed 84 5-17 yr. old children and adolescents in a study of psychogenic depression at the height of its development. 23 of these children were further subjected to a study of the dynamics of the depressive syndrome. Along with observational data, archival materials with anamnestic supplementation were also employed. Typical depressive states are rarely encountered in children. In their case the depressive syndrome is short-lived and its clinical symptoms attenuated and rudimentary. The younger the child is and the more predisposing factors there are (somatic failings, incorrect training, etc.), the more rudimentary the depressive syndrome and the more polymorphous the clinical picture, which consists of neurotic and pathocharacterological disorders. Psychogenic disorders in children exhibit the same dynamics as in adults: the depressive syndrome is replaced by an asthenoneurotic syndrome and then by characterological disturbances. In a number of cases, actual depressive disorders are little expressed and thus are often overlooked, with chief attention directed to the more striking neurotic and pathocharacterological disorders. (English summary)—*I. D. London.*

1502. **Kuznetsov, O. N.** **Klaustrosenoskopofobiya kak model' formirovaniya sindroma navyazchivyykh sostoyaniy.** [Claustrophobia as a model for formation of the syndrome of obsessive states.] *Zhurnal Nevropatologii i Psikiatrii*, 1970(Apr), Vol. 70(4), 551-556.—Describes an obsessive state (fear of continuous observation under conditions of confined solitude, open to "public view"), arising as a result of prolonged isolation in a soundproof chamber with a viewing window, for which the name claustrophobia is proposed. Its physiological, psychological, and social-psychological aspects are discussed. The emerging psychological state may be viewed as a model for the obsessive syndrome, resulting from a "clash of opposite tendencies, the disturbance of elaborated [conditioned] stereotypes, informational deficiency, and inadequate interpersonal relations." A phenomenological similarity with paranoid tendency and mental automatism appeared. (English summary) (33 ref.)—*I. D. London.*

1503. **Milner, A. D., Beech, H. R., & Walker, V. J.** (U. St. Andrews, Scotland) **Decision processes and obsessional behaviour.** *British Journal of Social & Clinical Psychology*, 1971(Feb), Vol. 10(1), 88-89.—Describes an exploratory investigation of 6 Ss with obsessional symptoms and 8 controls. All Ss suffered from depression and were required to detect faint auditory tone signals in white noise under 2 conditions: (a) 50 presentations, and (b) 100 presentations where trials were repeated upon request. It was found that the obsessional Ss made a significantly higher demand for repeated trials. It is hypothesized that in obsessional disorder, decisions may be deferred to an abnormal extent.—*P. Hertzberg.*

1504. **Peña y Lillo, Sergio.** (Chile U., Psychiatric Clinic, Santiago) **Definición condicional del síntoma fóbico neurótico.** [Conditional definition of phobic

neurotic syndrome.] *Acta Psiquiátrica y Psicológica de América Latina*, 1970(Sep), Vol. 16(3), 261-264.—Proposes a model to account for the phobic syndrome based upon reflexology and learning theory. Such a model includes the classic phobic symptoms plus "phobic mechanisms" usually present in several neurotic constellations: any fear or symptom potentially linked to anxiety should be considered as a phobic mechanism if the following characteristics are present: (a) systematic appearance in front of a given stimulus which is not to be feared by a patient within his culture, (b) fear and anxiety while expecting the stimulus to appear with the corresponding tendency to avoid the feared situation, (c) emergence of a gradient of similar feared situations, and (d) a generalization system develops whereby similar new stimuli may trigger phobic symptoms. (17 ref.)—*English summary.*

1505. **Roth, Martin & Myers, D. H.** (U. Newcastle upon Tyne, England) **Anxiety neuroses and phobic states: II. Diagnosis and management.** *British Medical Journal*, 1969(Mar), Vol. 1(5643), 559-562.—Discusses diagnostic treatment and management problems of anxiety neurosis with an emphasis on the dual involvement of mental life and body function. The need for careful differential diagnosis is stressed. Personalities likely to be vulnerable to neurotic anxiety are identified. Brief supportive psychotherapy is preferred to more intensive approaches in family practice. Drug treatment is seen as complementary but not as an alternative to psychotherapy. Social rehabilitation is felt to be important in cases of severe chronic anxiety states.—*I. Halev.*

1506. **Scott, W. Clifford.** **Les rôles défensifs réciproques de la dépression et de la manie.** [The mutually defensive roles of depression and mania.] *Interprétation*, 1968(Oct), Vol. 2(4), 95-107.—Discusses the conscious and unconscious interactions of depression and mania, stressing that "1 cause of chronicity in depression is its use as a defense against progression to mania, a mechanism which can be compared with fixation as a regressive defense against progression." Progression from depression to mania, conversely, is partly a defense against continuing to be depressed, in order to mourn well (progressive ego-dystonic defense), and partly a giving up of the defensive aspect of the persistence of depression.—*T. N. Webster.*

1507. **Trallero, Jose T.** (U. Barcelona, Hosp. Clinic, Spain) **Psicofisiología de la enuresis.** [Psychophysiology of enuresis.] *Anuario de Psicología*, 1969, Vol. 1, 117-125.—Presents an etiological pathogenic explanation for enuresis, and a related therapy. 23 6-25 yr. old enuretics were equipped with an electronic device which caused a bell to sound when they began to urinate. This enabled the Ss to wake and gain voluntary control of their sphincters. Within 30 days of treatment, all Ss were cured of enuresis. Success was attributed to treating the neurological basis of enuresis, rather than its psychogenic character. (16 ref.)—*P. Hertzberg.*

1508. **Trifonov, O. A.** (Central Inst. for Advanced Medical Training, Moscow, USSR) **Klinicheskaya dinamika patokharakterologicheskogo razvitiya lichnosti afektivnovozbudimogo tipa u detei i podrostkov.** [Clinical dynamics of pathocharacterological development of an emotionally excitable personality type in children and adolescents.] *Zhurnal Nevropatologii i Psikiatrii*, 1970(Oct), Vol. 70(10), 1552-1556.—Presents a catamnestic study (up to 10 yr.) of 85 children and adolescents (now 12-24 yr. of age), involving an analysis

of variants of situationally caused pathocharacterological development of the emotionally excitable personality. Psychogenic factors, age, and the characteristics of the "soil," out of which such variants emerge were considered. Criteria for delimitation from "nuclear" and organic psychopathies are presented. (English summary)—*I. D. London.*

1509. Zhukovskaya, N. S. (Central Inst. for Advanced Medical Training, Moscow, USSR) **Klinicheskaya dinamika reaktivnykh sostoyaniy v forme sindroma strakha u detey i podrostkov.** [Clinical dynamics of reactive states in the form of a fear syndrome in children and adolescents.] *Zhurnal Nevropatologii i Psikhiiatrii*, 1970(Oct), Vol. 70(10), 1544-1548.—Observed 51 3-15 yr. old children with "reactive fears" (RF) in order to (a) study RF both in its dynamics and as a function of age in the various stages of the reactive state (RS), (b) determine more exactly the influence of traumatic factors and of premorbid personality traits on the formation and retrograde development of RF, and (c) elucidate the interrelationship of RF with other RS symptoms. 2 variants of RS development with a fear syndrome were discerned: favorable—uniform RF throughout the course of the RS; and less favorable—RF associated with asthenic, hypochondriac, and psychopathiform disturbances. It is shown that, in the genesis of RSs with RF and their transition into protracted conditions, premorbid personality traits, noxious factors in early childhood, age, and other factors play a great role. (English summary)—*I. D. London.*

Psychosis

1510. Agishev, V. G. (Medical Inst. of Sanitation & Hygiene, Leningrad, USSR) **K dinamike izmeneniy belkov syvorotki krovi pri nekotorykh infektsionnykh psikhozakh.** [On the dynamics of blood serum proteins in some infectious psychoses.] *Zhurnal Nevropatologii i Psikhiiatrii*(Sep), Vol. 70(9), 1343-1348.—Presents the results of a study of 106 patients (15-over 40 yr. old) with acute infectious psychoses (postpuerperal, rheumatic, purulently focal). In most cases, dysproteinemia was disclosed. During the acute phase an increase was noted in the levels of the haptoglobulins, ceruloplasmin, sialic acid, and α -globulins in the blood serum. During the course of the psychosis, these indices underwent definite changes in the direction of normalization, while not quite attaining the values indicative of clinical recovery. In cases of recidivism of the psychosis, an increase occurred in most of the biochemical indices. (English summary) (30 ref.)—*I. D. London.*

1511. Belen'kaya, N. Ya. (Central Inst. for Advanced Medical Training, Moscow, USSR) **Zagruzhenost' i ee otnoшение k yavleniyam rasteryannosti.** [Overburdening and its relation to confusional effects.] *Zhurnal Nevropatologii i Psikhiiatrii*, 1970(May), Vol. 70(5), 727-731.—Presents an analysis of "overburdening" as "repletion of consciousness with intense morbid experiences," subsequent to the "affect of bewilderment" in which constitutes the essence of the confusional state in acute psychosis. The confusional state and acute psychosis are both integral to the syndromes of overburdening and it is in them that the various acute psychoses, and it is in them that the various manifestations of changes in self-consciousness (depression, delusion, hallucination, etc.) are revealed in the

course of acute development of disordered mental activity. 3 illustrative cases are presented. (English summary)—*I. D. London.*

1512. Felinskaya, N. I. & Immerman, K. L. (Central Research Inst. of Forensic Psychiatry, Moscow, USSR) **Tipy techniya i iskhodov psikhogennoi depressii.** [Types of course and outcomes of psychogenic depression.] *Zhurnal Nevropatologii i Psikhiiatrii*, 1970(Apr), Vol. 70(4), 564-569. Discusses 3 main syndromes of psychogenic depression encountered among the reactive psychoses in forensic psychiatric practice: depressive-paranoid, astheno-depressive, and depressive-hysterical. (English summary) (24 ref.)—*I. D. London.*

1513. Hamlin, Roy M. (Veterans Administration Hosp., Danville, Ill.) **Intellectual function 14 years after frontal lobe surgery.** *Cortex*, 1970(Sep), Vol. 6(3), 299-307.—Compared preoperative measures of intelligence with retests 8 and 14 yr. after frontal lobe surgery. All Ss were chronic psychotics at the time of the first tests. The long-term retests are reported for 33 nonoperated controls, for 16 patients with lower frontal lobe surgery (orbital topectomy), and for 18 patients with upper frontal lobe surgery (superior topectomy). Previous research showed that both groups of operated patients scored lower on intelligence tests shortly after surgery than they did before. The objectives of the long-term retests concerned: the permanence of changes, and the differential effects of lower and upper forebrain surgery. The lower forebrain patients obtained long-term scores remarkably comparable to those of the nonoperated controls. The superior topectomy patients showed significant loss 8 yr. after surgery, and this loss persisted 14 yr. after surgery. The loss was both permanent and appreciable, equivalent to some 10 points in IQ. Verbal and numerical tests reflected the permanent loss more clearly than perceptual and construction tests. The loss associated with upper frontal lobe surgery involved sustained attention, problem solving, and other intellectual functions. *R. Gunter*

1514. Jilek, Wolfgang G. & Jilek-Aull, Louise. (3 Gore Ave., Chiltwaick, British Columbia, Canada) **Transient psychoses in Africans.** *Psychiatry (Chica)*, 1970, Vol. 3(6), 337-364. A review of the literature reveals the paramount importance for African psychiatry of transient psychotic states of short duration and good prognosis, developing in close correlation with trauma. Definition of their nosological status is attempted. Special consideration is given to the concept of bouffee délirante and related syndromes; also to hysterical and schizophreniform psychoses. Organic and sociocultural aspects of etiology are evaluated. The question of racial and ecological determinants is examined and compared with historical and contemporary reports from the European scene. The phenomenon of transient psychosis is not specific to any area or ethnic group but more prevalent in tradition-directed cultures of preindustrial societies; exacerbation under conditions of acculturative stress is evidenced. Hypothetical explanations are offered for the fact that the phenomenon is less conspicuous in contemporary Western societies. (5 p. ref.) *Journal summary.*

1515. Khaletskii, A. M. (Astrakhan Medical Inst., USSR) **O smene sindromov v techenii periodicheskikh psikhozov.** [On change in syndromes in the course of periodic psychoses.] *Zhurnal Nevropatologii i Psikhiiatrii*, 1970(Apr), Vol. 70(4), 556-560. Discusses intermediate forms of schizophrenia and manic-depressive psychosis

following a periodic course, in which in the same person a considerable change in syndromes is observed, i.e., previous signs of schizophrenia give way to signs of manic-depressive psychosis and vice versa. This change may be connected with the intensity of the pathological process, but should not be taken as evidence of the essential unity of the 2 psychoses which continue to be distinguished by important differences. (English summary)—*I. D. London.*

1516. Makeev, G. A. (Karagandin Medical Inst., USSR) **O nekotorykh storonakh izucheniya immunologicheskoi reaktivnosti u bol'nykh shizofreniei i drugimi nervno-psikhicheskimi zabolevaniyami.** [On some aspects in the study of immunological reactivity in schizophrenia and other neuropsychic illnesses.] *Zhurnal Nevropatologii i Psikiatrii*, 1970(Jun), Vol. 70(6), 891-896.—110 15-44 yr. old schizophrenics (paranoid, nuclear, and periodic forms of the psychosis) were subjected to tests of nonspecific immunity (properdin, complement, phagocytosis), the autoimmune processes (Coomb's reaction), and skin-allergies (bacterial allergens). Serving as controls were normals, patients with psychogenic psychoses ("neuroses, reactive psychoses"), and patients with psychoses of residual organic origin. It was shown that immunological shifts in schizophrenia correlate with clinical symptoms to a greater degree and, above all, with the type of its course. (English summary) (35 ref.).—*I. D. London.*

1517. Meyer, Mortimer M. & Ekstein, Rudolf. **The psychotic pursuit of reality.** *Journal of Contemporary Psychotherapy*, 1970(Sum), Vol. 3(1), 3-12.—Hypothesized that "whereas in the normal individual the cathexis is to external criteria as the basis of reality testing, in the psychotic the cathexis is to the internal world as the criteria for such evaluation." The borderline psychotic is described as an individual whose cathexis may fluctuate from the use of external to internal criteria for both outer and inner experiences, or to the use of external criteria for outer experiences and inner criteria for inner experiences. Under these circumstances a form of sensory deprivation occurs on the level of psychic processes. In the treatment of the psychotic, it is considered necessary to join the patient in his primary process world in order to establish communication and to develop the wish and need for external reality. The hallucinatory wish is described as a major stumbling block in the pursuit of these aims. Illustrations are presented of the disturbance in cathexis with respect to the testing of outer and/or inner experiences. "Such variation helps explain both the difficulty in treating the psychotic and some of the marked variations in the social adaptiveness of psychotics."—*S. Knapp.*

1518. Mikhailenko, I. N. & Nuller, Yu. L. (Bekhterev Psychoneurological Inst., Leningrad, USSR) **Vliyaniye nekotorykh faktorov na zabolevaemost' maniakal'no-depressivnym psikhozom i na osobennosti ego techeniya.** [Influence of certain factors on the incidence of manic-depressive psychosis and on the features of its course.] *Zhurnal Nevropatologii i Psikiatrii*, 1970(Jun), Vol. 70(6), 907-911.—Anamnestic and clinical data for 125 19-70 yr. old manic-depressives were analyzed in order to (a) determine the frequency of occurrence of certain factors in the anamnesis of manic-depressives (hereditary predisposition, personality traits, and harmful exogenic factors, e.g., somatic diseases, head injuries, etc.), and (b) disclose their influence on the course of the psychosis. Where there was no hereditary predisposition,

malaria and a premorbid character, marked by mistrustful anxiety, appeared to be factors which increased the probability of occurrence of manic-depressive psychosis. The incidence was less in the presence of a predisposing heredity. (English summary)—*I. D. London.*

1519. Montinari, Giandomenico. **Psicoterapia interfaseica di una psicosi cicloide.** [Interphasal psychotherapy in a case of cycloid psychosis.] *Rivista di Psichiatria*, 1969(Sep), Vol. 4(5), 394-401.—Studied the case of a 28 yr. old with cycloid psychosis during 1½ yr between his 3rd and 4th attacks. As described by K. Leonhard, the 1st episodes indicate mobility and anxiety with pronounced interpretative-paranoid components, and frequent ecstatic experiences which progress to a euphoric-ecstatic-confused type. Cycloid psychosis, in its nosographic situation of symptoms and course of development, lies between manic depressive psychosis and schizophrenic syndrome. It appears to arise after psychotraumatic events with psychogenic forms. After a psychodynamic and therapeutic study, alternation of a brief serious psychotic period and long interval periods of symptoms in which the S often experiences normal activity was noted. Aspects which characterize cycloid psychosis are: (a) wealth and abundance of vivid, colorful, concrete details which are different from their objective reality; (b) facility of fluctuation between narcissistic-oral positions and phallic or edipic positions; (c) occurrence of the same dream; and (d) a scarce general differentiation of significant roles. Intensive treatment of these Ss is best.—*A. M. Farfaglia.*

1520. Muchnik, L. S. (Leningrad Medical Hygiene Inst., USSR) **Materialy k izucheniyu psikhoozov infektsionno-allergicheskogo proiskhozhdeniya.** [Materials on the study of psychoses of infectious-allergic origin.] *Zhurnal Nevropatologii i Psikiatrii*, 1970(Apr), Vol. 70(4), 570-576.—Reports results of a clinical and laboratory study, over a 1-12 yr. period, of 150 16-45 yr. old persons with psychoses, whose emergence was closely coincident in time with exacerbations of focal suppurative or rheumatic infections, in order to establish cause-and-effect connections between the infectious process and mental disorders in infectious psychoses. It is suggested that psychoses in long, drawn out infections have allergic origins which play a role in the genesis of organic cerebral impairment, sometimes in connection with hereditary predispositions. Among the many mental diseases diagnosed as periodic schizophrenia, atypical manic-depressive psychosis, organic brain lesion pursuing a periodic course, etc., are undoubtedly psychoses of infectious origin. (English summary) (21 ref.).—*I. D. London.*

1521. Pérez, T. Aurora & Labos, Elsa. (Gregorio Aráoz Alfaro Polyclinic, Psychopathology & Neurologic Service, Buenos Aires, Argentina) **Relación objeto y estructura mental: Fragmentos del análisis de un niño psicótico.** [Object relations and mental structure: Comments of an analysis of a psychotic child.] *Acta Psiquiátrica y Psicológica de América Latina*, 1970(Sep), Vol. 16(3), 269-272.—A brief case study of a psychotic child is used to illustrate the contention that early disturbed object relations distort the possibility of a normal evolution of the mental structure. The presence of a psychotic structure is stressed, built up as a defense mechanism derived from an impaired working-through of early psychotic anxieties, that favors a psychotic mental modality and hence a psychotic behavior.—*English summary.*

1522. Rand, Gene V. (U. Utah) **Differences in reinforcer control between psychotic and non-psychotic groups.** *Dissertation Abstracts International*, 1970(Nov), Vol. 31(5-B), 3004.

1523. Scharfetter, Christian. (U. Zurich, Psychiatric Clinic, Switzerland) **Zur Psychiatrie und Psychologie symbiotischer Psychosen.** [On the psychiatry and psychology of symbiotic psychoses.] *Psychologische Rundschau*, 1970(Oct), Vol. 21(4), 257-269.—The discussion of this rare psychosis is introduced with a case study of a "folie à deux." Induction of delusions from one person to another is seen as social-psychological phenomenon. The psychology of symbiotic psychoses and genetic processes underlying the psychosis are traced through the literature.—W. J. Koppitz.

1524. Sukhareva, G. E. **Roľ' voznrastnogo faktora v klinike detskikh psikhovozov.** [Role of the age factor in the clinical picture of childhood psychoses.] *Zhurnal Nevropatologii i Psikhiiatrii*, 1970(Oct), Vol. 70(10), 1513-1517.—Presents an observationally based discussion on the importance of age in the emergence, clinical symptoms, and course of mental diseases up to the age of 16 yr. The influence of reactivity, associated with a given age, cannot be regarded as merely a pathoplastic factor, since it often is also pathogenetic. The important factors, determining the pathogenetic role of age, are: (a) underdevelopment of different organs and systems, and (b) disharmony of development during the transitional phases of growth. (English summary)—I. D. London.

1525. Tsvetkova, N. B., Dvoynikov, N. D., & Ionova, M. I. (Gorki Medical Inst., USSR) **Elektro-entsefalograficheskie dannye u bol'nykh afektivno-bredovymi i bredovymi psikhovozami presenil'nogo vozrasta v protsesse ikh katamnestichestskogo izucheniya.** [Electroencephalographic data in presenile persons with affective-delusional and delusional psychoses in catamnestic studies.] *Zhurnal Nevropatologii i Psikhiiatrii*, 1970(Jun), Vol. 70(6), 879-885.—Reports results of EEG examinations during catamnesis conducted over a 3-17 yr. period from the time of onset of the syndrome of anxiety-delusional melancholia in 22 presenile women and the syndrome of presenile delusion of harm in 12 others. The EEG in presenile affective-delusional psychoses was characterized by relatively shallow changes, in the form of a slowdown in α -rhythm and the appearance of single slow waves. EEG changes in presenile delusional psychoses had a more marked character with considerable disorganization of α -rhythm and slow activity. In presenile affective-delusional psychoses correlation was observed between EEG data and the severity of the melancholia syndrome. In presenile delusional psychoses, EEG changes were more pronounced in late paranoid schizophrenia and less in nonschizophrenic delusional psychoses. In evaluating the EEG in both types of psychoses, it is necessary to take into account the possibility of influence of vascular pathology on the bioelectrical activity of the brain. However, the nature and moderate character of the EEG changes in both types of psychoses suggest that functional disturbances in cortical neurodynamics predominate in their mechanisms. (English summary)—I. D. London.

1526. van der Does de Willebois, A. E. **De la Psychomotricité.** [On psychomotor reaction.] *Psychiatria, Neurologia, Neurochirurgia*, 1968(Nov), Vol. 71(6), 483-500.—Reviews the literature on psychomotor activity, and discusses: (a) the original "purely organic"

concept in pathology; (b) the singular role of the reflex arc and its subsequent influence in psychiatry; (c) the question of whether motor activity is modified by psychological reactions or vice versa; (d) the importance of repetitive movements in psychosis and their relationship to certain emotional states; (e) the global psychomotor reactions within the context of man in his totality, attaching greater significance to movements of expression related to emotional experience, since they may resemble motor disorders due to encephalopathy; and (f) the evolutionary primacy of motor activity, with attention focused on the functions of the limbic system, and its close relationship to the problems of modern man. It is asserted that "in certain respects, psychosis can be considered as a withdrawal to the limbic system." (31 ref.)—H. Singer.

1527. Widner, Frederic C. (Temple U.) **Training psychotics to discriminate sick and healthy behaviors.** *Dissertation Abstracts International*, 1970(Oct), Vol. 31(4-B), 2294.

Schizophrenia

1528. Bailey, John M. (Indiana U.) **Response disorganization and breadth of observation in acute and chronic schizophrenics, normals under high drive, and normal controls.** *Dissertation Abstracts International*, 1970(Oct), Vol. 31(4-B), 2271-2272.

1529. Bauman, Edward. (Lakehead U., Port Arthur, Ontario, Canada) **Schizophrenic short-term memory: A deficit in subjective organization.** *Canadian Journal of Behavioural Science*, 1971(Jan), Vol. 3(1), 55-65.—24 schizophrenic and 24 normal Ss received 3 trials on each of 2 lists of trigrams, 1 being for recognition and the other for recall. $\frac{1}{2}$ of the Ss received special instructions for alphabetical ordering of the recall terms, while the other $\frac{1}{2}$ was asked to do their best. Special instructions facilitated recall of normal Ss, but not of schizophrenics. Instructions had no significant effect upon the recognition scores. The effect of trials was to increase schizophrenic recall, but not recognition, while normals showed gains both in recall and recognition. It is concluded that the schizophrenic recall deficit results, in part, from an inability to subjectively organize memory store. (French summary) (28 ref.) *Journal abstract*.

1530. Belloni, F. (P. Pini Provincial Hosp. Inst., Milan, Italy) **Studio delle anomalie morfologiche linfocitarie nell'ambito familiare di soggetti schizofrenici.** [Morphological investigation of lymphocyte anomalies in relatives of schizophrenic subjects.] *Acta Neurologica*, 1970(Jan), Vol. 25(1), 59-69.—Studied the relatives of 22 schizophrenics. Blood was extracted from their finger and subjected to panocytic colorization according to Pappenheim. In all cases there were peripheral blood lymphocyte changes, especially cytoplasmic basophilia and nuclear polymorphism. The hereditary factor is transmitted as a predisposition to get the disease. The abnormal lymphocytes represent the morphological substratum of the modifications made by probable metabolic error. (English summary)—A. M. Farfaglia.

1531. Bernal, Martha E. & Miller, William H. (U. California, Neuropsychiatric Inst., Los Angeles) **Electrodermal and cardiac responses of schizophrenic children to sensory stimuli.** *Psychophysiology*, 1970(Sep), Vol. 7(2), 155-168.—Compared the reactivity and habituation of 20 3-13 yr. old autistic schizophrenic

and 20 3-11 yr. old normal children using a variety of stimuli. The 1st 2 stimulation conditions were 15 tone trials followed by a novel tone stimulus, and 15 periods of darkness followed by a single period of partial illumination. Order of these stimulation conditions was counterbalanced in a groups \times order \times trials analysis of variance factorial design. Other stimuli were tones varying in intensity and photic flashes presented in fixed order following the 1st 2 conditions. The 2 groups differed in magnitude of response to the 1st 3 tone and illumination change trials, and thereafter showed no differences in habituation or reinstatement to the novel stimulus. This difference consisted of greater responsiveness for the normals and was independent of base level, spontaneous activity, order of condition, and type of stimulus. The schizophrenics showed a relationship between GSR magnitude and tone intensity that was similar to the normals' physiological tracking of changing intensity. Results for photic stimulation are the same as for the 1st 2 stimulus conditions. The peak-to-valley cardiac measure failed to yield any reliable group differences under any stimulation condition. (15 ref.)—*Journal abstract*.

1532. Bigras, Julien. *L'écoute psychiatrique et l'écoute psychanalytique, à la lumière d'un texte de Karl Abraham sur la psychose*. [Psychiatric and psychoanalytical reception within the context of a text on psychosis by Karl Abraham.] *Interprétation*, 1970(Jan), Vol. 4(1-2), 157-163.—Compares the psychiatric approach of Karl Abraham and the psychoanalytical method of Freud in interpreting the case of 1 of Abraham's schizophrenic patients. It is argued that the attention of a psychiatrist is primarily focused on the symptomatic aspect of a patient while the psychoanalyst concentrates above all on his own unconscious, as well as that of his patient, because of his capacity for autoanalysis. It is concluded that autoanalysis constitutes the most apparent distinction between the psychoanalytical and psychiatric methodology.—*S. Maze*.

1533. Cameron, James R. (U. California, Berkeley) *Background variables related to the various forms of childhood autism*. *Dissertation Abstracts International*, 1970(Oct), Vol. 31(4-B), 2274.

1534. Carley, John W. (North Texas State U.) *Effects of three conditions of reinforcement on the performance of three learning tasks by hospitalized chronic schizophrenics*. *Dissertation Abstracts International*, 1970(Oct), Vol. 31(4-B), 2275.

1535. Chudina, L. D. (1st Moscow Medical Inst., USSR) *K zakonomernostyam smeny tipa techeniya katatonicheskoi shizofrenii*. [On the principles of change in type of course of catatonic schizophrenia.] *Zhurnal Nevropatologii i Psikiatrii*, 1970(Jul), Vol. 70(7), 1027-1031.—Presents a catamnestic study in order to (a) further clarify the different courses of the developing psychosis observed in catatonic schizophrenia, (b) establish the pattern of their clinical pictures, and (c) determine the factors which either facilitate or hinder change in the developing course of the psychosis. Duration of catamnestic observations lasted up to 28 yr. for 279 schizophrenics, the onset of whose psychosis took place at ages from 7-59 yr. 3 basic types of course were established: (a) periodic (68 Ss), (b) discontinuous-progressive (80 Ss), and (c) continuous-progressive (131 Ss). With the exception of those in the last-named group, most experienced a transition from a relatively favorable course to 1 that was unfavorable, to the accompaniment

of psychopathological syndromic complication, the appearance of symptoms of deficit, and a reduced level of social adaptation. Such a transition occurred most often during the 1st 7 yr. of the psychosis under the impact of unfavorable exogenic factors. (English summary)—*I. D. London*.

1536. Dreistadt, Roy. *Schizophrenia: A new research design to study its causes*. *Journal of Psychology*, 1971(Mar), Vol. 77(2), 157-164.—Describes the findings of the major twin studies of schizophrenia that began with the classical research done by F. J. Kallmann. A new 2 part research design using data from identical twins was outlined to delineate genetic factors, childhood environmental factors, and later environmental factors in the etiology of schizophrenia. The nature of the possible genetic causes of schizophrenia as discussed and a self-actualization theory of schizophrenia is outlined. It was shown that the findings of various kinds of psychological and sociological research tend to support a self-actualization theory of schizophrenia. (20 ref.)—*Journal summary*.

1537. Filippov, Yu. I. (Inst. of Psychiatry, Moscow, USSR) *Narusheniya v sisteme polovyykh khromosom u bol'nykh shizofreniei zhenshchin*. [Disturbances in the sex-chromosomal system in schizophrenic women.] *Zhurnal Nevropatologii i Psikiatrii*, 1970(May), Vol. 70(5), 715-717.—Studied (a) the frequency of trisomia-X among mentally ill women and its distribution among the different diagnostic groups, and (b) the clinico-psychopathological features characterizing such cases. Karyological examinations of 2000 mentally ill women were conducted, 1333 of whom were schizophrenic. 6 (all schizophrenic) were disclosed to have sex-chromosomal aberrations: 3 exhibited gametic trisomia-X (47,XXX) and 3 exhibited mosaicism (46,XX/47,XXX). The former were diagnosed as suffering from variants of a continuously developing schizophrenia pursuing an unfavorable course; the latter from attacklike schizophrenia following a more favorable course. (English summary) (15 ref.)—*I. D. London*.

1538. Fineman, Carol A. (U. Miami) *Goal setting strategies and the avoidance of evaluation in schizophrenia*. *Dissertation Abstracts International*, 1970(Oct), Vol. 31(4-B), 2278.

1539. Gavrilova, N. A. (Inst. of Higher Nervous Activity & Neurophysiology, Moscow, USSR) *Sravnitel'naya otsenka prostranstvennoi sinkhronizatsii biopotentsialov kory golovnogo mozga u zdorovykh i bol'nykh shizofreniei pri issledovanii korotkikh vremennykh intervalov*. [Comparative estimation of spatial synchronization of cortical biopotentials in normals and schizophrenics when employing short time-intervals.] *Zhurnal Nevropatologii i Psikiatrii*, 1970(Aug), Vol. 70(8), 1198-1207.—Studied the features characterizing the spatial synchronization of cortical biopotentials for intervals of time equal to 250 msec. in normals and in paranoid schizophrenics under conditions of quiet and during mental activity (mental multiplication of 2 digit numbers). The dynamic character of the interactions between parts of the cerebral cortex was shown to be very considerable in normals. These interactions had a direction which coincided with that of the course of the long associative fibers. Processes in this direction proceeded more quickly than in the system of commissural fibers. Spatial synchronization is changed in paranoid schizophrenia. Here the normal dynamic character of processes was absent. Portions of

of whose psychosis proceeds with a prevalence of negative effects.] *Zhurnal Nevropatologii i Psikiatrii*, 1970(Sep), Vol. 70(9), 1368-1374.—Studied 50 16-40 yr. old male schizophrenics, the course of whose psychosis developed with the absence of an expressed psychotic symptomatology, and salient changes in personality. Early anamnesis disclosed marked signs of dysontogenesis, so that it is best to view such cases as child or, possibly, congenital schizophrenia. Some of the traits of personality, disclosed in childhood, are to be viewed as more characteristic of the schizophrenic defect than they are of the personality traits themselves. (English summary) (27 ref.)—*I. D. London*.

1548. **Kalugina, I. O.** (USSR Academy of Sciences, Inst. of Psychiatry, Moscow) **Klinicheskie osobennosti pristupoobrazno-progredientnoi shizofrenii u detei.** [Clinical features of attack-like-progressive schizophrenia in children.] *Zhurnal Nevropatologii i Psikiatrii*, 1970(Oct), Vol. 70(10), 1528-1532.—Presents results of observations of 53 5-12 yr. old children with a schizophrenia characterized by an attack-like progression. This form of the psychosis is encountered relatively often. 3 types of schizophrenia were distinguished: (a) 9 cases with a course approximating the continuous-sluggish form, (b) 32 running a continuous course combined with acute psychotic attacks, and (c) 12 with a course approximating the periodic form. While there may be varied degrees of progression of the psychotic process, the basic developmental patterns in the children were the same as in adults. However, in children the psychopathological structure of the attacks is characterized by the less marked nature of all symptoms. Besides, in children during remission, apart from symptoms of a schizophrenic defect, signs appear of arrested mental development. (English summary)—*I. D. London*.

1549. **Kalyagin, V. N. & Minchev, E. E.** (Astrakhan Medical Inst., USSR) **Rezultaty eksperimental'nopsikhologicheskogo i pnevmontsefalograficheskogo issledovaniia bol'nykh periodicheskoi shizofreniei.** [Results of experimental-psychological and pneumo-encephalographic examinations of periodic schizophrenics.] *Zhurnal Nevropatologii i Psikiatrii*, 1970(Dec), Vol. 70(12), 1842-1845.—Ss were 20 periodic schizophrenics (mostly 20-50 yr. of age) with clinical pictures predominantly marked by affective disorders, and number of attacks ranging from 3-20. All were subjected to psychological tests, while 10 were subjected, in addition, to pneumo-EEG examinations. Most of the Ss disclosed deviations indicating the existence of organic lesion of the brain. While this fact does not preclude an initial clinical diagnosis of periodic schizophrenia, it does point to the existence of a pathological background against which this endogenic affection develops and may explain the atypicality of its clinical picture and course of development. (English summary) (16 ref.)—*I. D. London*.

1550. **Kirpichenko, A. A.** (Vitebsk Medical Inst., USSR) **Sravnitel'naya kharakteristika izmenenii vyzvannykh potentsialov golovnogo mozga u bol'nykh razlichnymi formami shizofrenii.** [Comparative characteristics of the changes in evoked potentials in the brain of patients with different forms of schizophrenia.] *Zhurnal Nevropatologii i Psikiatrii*, 1970(Jun), Vol. 70(6), 870-873.—Reports results of electrophysiological examinations of 168 16-50 yr. old patients with various forms of schizophrenia (sluggishly developing, paranoid, nuclear, attacklike, periodic). A correlation was demonstrated between the forms of the earlier components

(the specific or primary) and the later waves (the nonspecific or secondary) of photically evoked potentials, on the 1 hand, and, on the other, the form and duration of the psychosis. Under conditions of normal cerebral activity, (a) regulation of excitational behavior along specific and nonspecific pathways was managed owing to corticofugal influences, and (b) optimal relationships were created between information on the physical parameters of signals and that on their significance for the organism. In schizophrenia, however, a disturbance of the mechanisms of afferent synthesis occurred, and as a consequence, "a distorted reflection of the surrounding reality." (English summary)—*I. D. London*.

1554. **Lavretskii, E. F.** (Tomsk Medical Inst., USSR) **O sindrome lozhnoye uznvaniya pri shizofrenii.** [On the syndrome of false recognition in schizophrenia.] *Zhurnal Nevropatologii i Psikiatrii*, 1970(Apr), Vol. 70(4), 560-564.—53 17-52 yr. old schizophrenics, with manifestation of the syndrome of false recognition at 1 stage or another in the development of the pathological process, were observed in a study of the symptomatology of Capgras' syndrome. 4 components of the syndrome were discerned: "positive double delusion, negative double delusion, intermetamorphic delusion, [and] Fregoli's symptom." It is shown that the syndrome of false recognition is not uniform with respect to either origin, course, or outcome. Further research is indicated to determine more exactly (a) the signs of this particular disorder, (b) the variants of its transformation, and (c) its relation to other psychopathological disturbances. 1556. **Marchbanks, Gabrielle & Williams, Moyra.** (Fulbourn & Cambridge United Hosp., Cambridge, England) **The effect of speed on comprehension in schizophrenia.** *British Journal of Social & Clinical Psychology*, 1971(Feb), Vol. 10(1), 55-60.—Devised and administered a task involving the carrying out of spoken commands of varied length and frequency to 80 schizophrenic Ss and 40 nonpsychotic controls under 4 conditions of speed. Schizophrenics made more errors as the speed of the commands was increased. Controls made more errors when natural pauses were eliminated than under the fastest speed condition. Schizophrenics repeated words from the commands as the speed of

delivery increased; controls repeated less as the speed increased.—*Journal abstract.*

1557. Monakhov, K. K. & Strelets, V. B. (Inst. of Psychiatry, Moscow, USSR) **K voprosu o strukture funktsional'nykh svyazei mezhdu vyzvannoi élektricheskoi aktivnost'yu temennoi i zatylochnoi oblasti kory golovnogo mozga u zdorovykh lyudei i bol'nykh shizofreniei.** [On the structure of functional connections between evoked electrical activity in the parietal cortex and that in the occipital cortex in normals and schizophrenics.] *Zhurnal Nevropatologii i Psikiatrii*, 1970(Jun), Vol. 70(6), 864-870.—Attempted to formulate "EEG criteria for systemic organization in cerebral activity," employing 25 normals and 53 schizophrenics (before and during neuroleptic treatment). Superpositional recordings of parietal and occipital electrical activity, evoked by a light flash, were made. The data suggest that a specific program exists for the development of the electrical response—a program which secures the successive recruitment of the various functional structures that make up the response. In schizophrenia of different forms, disruption of the program for the development of the evoked response occurred. (English summary)—*J. D. London.*

1558. Ovsyannikov, S. A. (Central Inst. for Advanced Medical Training, Moscow, USSR) **Vyaloprotekayushchaya shizofreniya s istericheskimi proyavleniyami.** [Sluggishly developing schizophrenia with hysterical symptoms.] *Zhurnal Nevropatologii i Psikiatrii*, 1970(Jul), Vol. 70(7), 1031-1037.—50 18 61 yr. old schizophrenics with duration of psychosis from 2-45 yr. were observed in a study of 2 forms of hysterical disorders occurring in schizophrenia following a sluggish course: (a) stable hysterical disorders, at whose basis lie a "thirst for recognition" and a desire to attract attention, and (b) transitory hysterical reactions of partial character. Analysis of the clinical features of the observed hysterical disorders led to the discernment of 3 diagnostic groups: 27 Ss with a predominance of hysterical symptoms in the schizophrenic picture, 19 Ss with a combination of hysterical symptoms and obsessional symptoms, and 4 Ss with a combination of hysterical disorders and symptoms of depersonalization. Hysterical symptoms were characteristic of the earlier stages of the psychosis (5-8 yr from its onset). Later hysterical symptoms gradually were replaced by psychopathoform disorders of heboid character which grew more and more stereotyped as they were fused with affective disturbances and paranoid symptomatology. At this time typical changes of personality gradually increased along with traits of psychic infantilism. (English summary) (25 ref.)—*J. D. London.*

1559. Ritvo, Edward R., et al. (760 Westwood Plaza, Los Angeles, Calif.) **Decreased postrotatory nystagmus in early infantile autism.** *Neurology*, 1969(Jul), Vol. 19(7), 653-658.—It was found that children with early infantile autism and evidence of perceptual inconstancy had significantly shorter postrotatory nystagmus than normal children when tested with their eyes open in a lighted room. However, when the same patients were blindfolded and tested in a darkened room, there was no longer a significant difference. A lack of response difference among children in the patient group was also found. Clinical factors in the patient group of personality development did not appear to influence the findings. This result supports the assumption that children who demonstrate evidence of perceptual inconstancy most likely have a unitary disease

process. It is particularly significant that the differences from normal children occurred when there were competing stimuli (visual and vestibular input), in contrast to the situation with vestibular stimulation alone. No evidence of habituation was noted in either group. Among the patients, clinical factors such as mutism, echolalia, normal speech, or the presence of a thought disorder did not appear to be discriminatory. *F. O. Triggs.*

1560. Rossi, R., Delmonte, P., & Terracciano, P. **Il problema dei rapporti fra omosessualità e schizofrenia.** [The problem of relationships between homosexuality and schizophrenia.] *Archivio di Psicologia, Neurologia e Psichiatria*, 1969(Jan), Vol. 30(1), 48-71. Homosexual trends at the conscious and unconscious level, were studied in the files of 100 schizophrenics. Results did not support psychoanalytic contentions on the role of homosexuality in schizophrenia, since homosexual trends did not play a relevant role in the etiology of schizophrenia and related delusional contents. *I. L'Abate.*

1561. Serebryakova, Z. N. (USSR Academy of Medical Sciences, Inst. of Psychiatry, Moscow) **Kvalifikatsiya i trudospособnost' bol'nykh shizofreniei s nepreryvnym techeniem po dannym épidemiologicheskogo issledovaniya.** [Working qualifications and capacity of schizophrenics whose course of psychosis is continuous according to data of an epidemiological study.] *Zhurnal Nevropatologii i Psikiatrii*, 1970(Sep), Vol. 70(9), 1375-1381. Presents results of an epidemiological study of "social adaptation" in schizophrenics (continuous form of psychosis) with respect to their mental state at the time of their examination. Working qualifications and capacity in cases of paranoid (296 cases) and unfavorably developing schizophrenia (92 cases), drawn from a general population of 1419 schizophrenics, are described. No significant difference in the proportion (15%) of working schizophrenics with respect to these 2 groups was disclosed. Working qualifications and capacity are shown to be a direct function of degree of advance of the morbid process. (English summary) *I. D. London.*

1562. Serebryakova, Z. N. (Inst. of Psychiatry, Moscow, USSR) **Sotsial'naya adaptatsiya bol'nykh shizofreniei s vyalyim techeniem zabolevaniya (po dannym épidemiologicheskogo issledovaniya).** [Social adaptation of schizophrenics whose psychosis follows a sluggish course (according to the data of an epidemiological study).] *Zhurnal Nevropatologii i Psikiatrii*, 1970(Dec), Vol. 70(12), 1846-1850. An epidemiological study of 1 of a number of populations of schizophrenics disclosed 404 cases with sluggish development of the psychosis, constituting 28.2% of the population, 53.2% of these were working individuals. A study of the number of those working and of those psychotically disabled as a function of the leading syndrome and the duration of the psychosis shows that (a) the syndrome which is characterized by mildly expressed changes in personality is the most favorable with respect to adaptive potentialities, (b) syndromes with unsystematized delusional ideas and paranoid disorders are the least favorable, and (c) remaining syndromes (asthenic disorders, exaggerated structures, affective disorders) occupy an intermediate position. (English summary)—*I. D. London.*

1563. Serebryakova, Z. N. (USSR Academy of Medical Science, Inst. of Psychiatry, Moscow) **Sravnitel'naya kharakteristika kvalifikatsii i**

trudospobnosti bol'nykh shizofrenii s pristupo-obrazno-progredientnym i periodicheskim techeniem po dannym épidemiologicheskogo issledovaniya. [Comparative characteristics of the work qualification and capacity of schizophrenics with discontinuously progressive and periodic courses of their psychoses according to the data of an epidemiological study.] *Zhurnal Nevropatologii i Psikiatrii*, 1970(Nov), Vol. 70(11), 1701-1706.—Examined 352 cases of discontinuously progressive schizophrenia and 269 cases of periodic schizophrenia (constituting 24.8 and 18.9%, respectively, of the investigated population of schizophrenics). Working capacity and vocational qualification appeared to be a function of the number of attacks suffered and the character of the ensuing remission. Data are presented which provide evidence for better work adaptation in those in whom no productive disorders are observed in remission. (English summary)—*I. D. London*.

1564. Shmaonova, L. M. & Liberman, Yu. I. (Inst. of Psychiatry, Moscow, USSR) *Kliniko-statisticheskaya kharakteristika shizofrenii, protekayushchei v forme shubov i periodicheskii*. [Clinico-statistical characteristics of schizophrenia, following discontinuous and periodic courses.] *Zhurnal Nevropatologii i Psikiatrii*, 1970(Jul), Vol. 70(7), 1037-1046.—An analysis of clinical observations of 770 schizophrenics (453 with a discontinuously progressive course of psychosis, and 317 with a periodic course). The necessity of a many-sided integrated approach to the "search for information on the prognosis and nosography of schizophrenia" is argued for—disclosure of general clinico-statistical relationships, determination of the separate types of development of the psychosis, and study of the psychopathological features characterizing the structure and dynamics of the symptoms, taking into account sex, age at onset of the psychosis, as well as a number of other factors which determine individual prognosis. (English summary)—*I. D. London*.

1565. Silverman, Julian. (Agnews State Hosp., San Jose, Calif.) *When schizophrenia helps*. *Psychology Today*, 1970(Sep), Vol. 4(4), 62-65.—There is growing evidence that some forms of schizophrenia are preludes to a more healthy level of adjustment. People who become better adjusted after such an episode, tend to be those whose symptoms appeared suddenly in response to a crisis and without paranoid coloring. The schizophrenic state is a period of heightened sensitivity and perhaps an opportunity to construct new alternatives in life. The administration of drugs to reduce symptoms may actually interfere with the necessary personality reorganization and the problem solving behavior.—*E. J. Posavac*.

1566. Silverman, Lloyd H. & Candell, Peter. (Veterans Administration Hosp., New York, N.Y.) *On the relationship between aggressive activation, symbiotic merging, intactness of body boundaries, and manifest pathology in schizophrenics*. *Journal of Nervous & Mental Disease*, 1970(May), Vol. 150(5), 387-399.—60 20-54 yr. old male, relatively differentiated schizophrenics were seen individually for 3 sessions. In each session, a base-line assessment was made of the amount of manifest psychopathology and the degree to which ego boundaries were intact. Then, on different days in counterbalanced order, 1 group of Ss was subliminally exposed to pictures containing aggressive content,

neutral content, and content suggesting the theme of symbiotic merging. The other group was shown the same stimuli, but at a supraliminal level. For both groups, there followed a critical assessment of manifest pathology and body boundary intactness. Ss in the subliminal group responded to both the aggressive and merging stimuli with changes in both manifest pathology and body boundary intactness, while Ss in the supraliminal group were unaffected by the 2 kinds of stimulation. The reaction of the subliminal group, under both experimental conditions, varied as a function of time after stimulation, this being seen as bearing on the variability of schizophrenic behavior. Results are discussed in relation to the motivational state underlying changes in manifest pathology and body boundary intactness. (23 ref.)—*Journal abstract*.

1569. Stamboliev, P. N. (High Medical Inst., Varna, Bulgaria) *Immunoelektroforeticheski analiz syvorotki krvi v dinamike shizofrenii*. [Immunoelectrophoretic analysis of blood serum in the dynamics of schizophrenia.] *Zhurnal Nevropatologii i Psikiatrii*, 1970(Sep), Vol. 70(9), 1339-1343.—Attempted to establish a possible connection between the immunoelectrophoretic properties of blood serum drawn from 244 schizophrenics and the features characterizing their mental state at different stages in the developing psychosis. Blood serum was examined in 102 schizophrenics during both psychotic attacks and remission. An increase was noted in various globulin fractions—most often seen in schizophrenics undergoing their 1st and 2nd attacks (especially in periodic schizophrenia); less frequently in schizophrenics under observation during the later attacks and in chronic cases (continuous-progressive schizophrenia and intermediate forms). In cases of 1st attack, most characteristic was an increase in the β_2 A-globulin fraction. However, in more remote attacks an increase in α_2 -globulins was frequently noted. In remissions following 1st attacks, immunophoregrams became normal, while this did not occur in subsequent attacks. It is suggested that changes in the globulins of blood serum reflect the activity of the morbid process. (English summary) (23 ref.)—*I. D. London*.

1570. Tsutsul'kovskaya, M. Ya., Khurgin, Ya. I., Fastovets, N. O., & Pekunova, L. G. (USSR Academy of Medical Sciences, Inst. of Psychiatry, Moscow) *Opredelenie prognoza yunosheskoï nepreryvno tekushchei shizofrenii s ispol'zovaniem metodov matematicheskogo analiza*. [Determination of the prognosis of juvenile continuously developing schizophrenia through utilization of the methods of mathematical analysis.] *Zhurnal Nevropatologii i Psikiatrii*, 1970(Nov), Vol. 70(11), 1694-1701.—Presents a clinicomathematical analysis of schizophrenics whose psychoses displayed courses of different types: sluggishly progressive (463), moderately progressive (158), malignantly progressive (185). 130 initial symptoms of the mental disease were distinguished and, employing a diagnostic algorithm, basic rules were constructed for

computer-determination of the type of course to be expected on the basis of early signs. The most informative signs and their combinations were also determined. A coincidence of 92-94% was procured for clinical and machine diagnoses. (English summary)—*I. D. London.*

1571. Wohlberg, Gerald W., Knapp, Peter H., & Vachon, Louis. (Boston U., Medical School) **A longitudinal investigation of adrenocortical function in acute schizophrenia.** *Journal of Nervous & Mental Disease*, 1970(Oct), Vol. 151(4), 245-265.—Followed the course of acute schizophrenics, including 2 intensively studied females, throughout hospitalization by means of: (a) plasma cortisol obtained twice daily, (b) 24-hr urine analysis for 17-ketogenic steroids (17-KGS), (c) tape recordings of daily therapy rated for major affects and "defensive strain," (d) computerized nursing notes, and (e) 2-person drawings rated on a primitive sophisticated scale. "Defensive strain," significantly correlated with plasma cortisol and 17-KGS in 1 S. In another case, psychotic manifestations appeared to be defending against depressive affect. The drawings correlated positively with adrenal cortical activity. Judges, blind to the biochemical findings, divided hospitalization into acute, improving, and separation phases, and predicted the phases to have, respectively, high, low, and intermediate biochemical values. These predictions proved correct for plasma cortisol. Data from 6 additional Ss confirmed elevation of plasma cortisol, urinary 17-KGS, or both, before separation, and significantly higher PM plasma cortisol 24 hr. after admission than at time of admission. Mean PM plasma cortisol and 17-KGS were elevated. Admission PM plasma cortisols were significantly higher than normal controls. Emphasis is placed on the intra and interindividual biochemical and psychological differences within the group of Ss, the total context of the S and, particularly, the meaning and effectiveness of his defensive system. (56 ref.)—*Journal abstract.*

1572. Yur'eva, O. P. (Inst. of Psychiatry, Moscow, USSR) **O tipakh dysontogeneza u detei, bol'nykh shizofreniei.** [On types of dysontogenesis in schizophrenic children.] *Zhurnal Nevropatologii i Psikiatrii*, 1970(Aug), Vol. 70(8), 1229-1235.—Reports results of observations (over a 1-15 yr. period) of 172 dysontogenetic schizophrenics, 5-33 yr. of age at time of final examination, in a study of the relationship between (a) the features characterizing dysontogenesis in the premanifest period of the affection, and (b) their manifest time and clinical features. 2 major types of dysontogenesis are distinguished: distorted development and arrested development. A correlation is established between the features of dysontogenesis and its degree of gravity and progressive character in the manifest period. It is suggested that the symptoms of dysontogenesis, as well as the individual psychopathological disorders in the premanifest period, are a manifestation of the basic disease. (English summary)—*I. D. London.*

1573. Zaltsman, E. G. (Central Inst. for Advanced Medical Training, Moscow, USSR) **O znachenii issledovani sialovoi kisloty v spinnomozgovoii zhidkosti i syvorotke krovi pri shizofrenii u detei.** [On the significance of sialic acid examinations in the cerebrospinal fluid and blood serum in childhood schizophrenia.] *Zhurnal Nevropatologii i Psikiatrii*, 1970(Oct), Vol. 70(10), 1521-1523.—Presents the results of sialic acid (SA) examinations of (a) 3-16 yr. old

schizophrenics (20 with unfavorable catatonic course of the psychosis, 63 with sluggish course, and 22 with acute onset with attack-like course); and (b) control groups (12 with rheumatic psychoses, 10 with residual symptoms of early organic lesions of the brain, and 22 with psychopathic traits of character without organic pathology). The highest positive deviations of the SA deviations investigated were found in rheumatic psychoses, the lowest in organic lesions of the CNS. In schizophrenia SA changes were expressed less than in the other groups. However, the direction of change tended to differ for early unfavorably developing schizophrenia and for the acute onset of periodic schizophrenia, with decrease in the case of the former and increase in that of the latter. It is suggested that SA level reflects the activity of the pathological process and the effectiveness of pathogenetic therapy. (English summary)—*I. D. London.*

1574. Zavidovskaya, G. I. (USSR Academy of Medical Sciences, Inst. of Psychiatry, Moscow) **Tipologiya sindroma navyazchivosti u bol'nykh blagopriyatno protekayushchei shizofreniei.** [Typology of the obsessional syndrome in those with favorably developing schizophrenia.] *Zhurnal Nevropatologii i Psikiatrii*, 1970(Nov), Vol. 70(11), 1686-1694. Observed 50 30 59 yr. old schizophrenics (duration of psychosis: 15 40 yr.). 2 types of obsessional syndromes were distinguished. The 1st type was characterized by a predominance of obsessional phobias and fears, which during periods of morbid exacerbations, appeared overly exaggerated structures. This type was associated with a development of the psychosis that is slightly progressive. The 2nd type of syndrome was characterized by a predominance of a wide range of other obsessional forms, e.g., contrastive thoughts and images, obsessive impulses, acute phobic attacks accompanied by marked autonomic disorders, and Geltungszwang (an urge to consider as true the improbable, even if its impossibility is simultaneously acknowledged). During periods of greatest acuteness of the psychosis, the syndrome became reminiscent of acute delusional states and was characterized by a clinical picture of protracted attacks. (English summary) (43 ref.)—*I. D. London.*

Schizophrenia Treatment

1575. Berman, Alan L. (Catholic U. of America) **The effect of videotape self-confrontation on level of ego functioning and thought disturbance in non-paranoid, process schizophrenics.** *Dissertation Abstracts International*, 1970(Nov), Vol. 31(5-B), 2976.

1576. Buscaino, V. M. **Biologia e terapia della schizofrenia.** [Biology and therapy of schizophrenia.] *Acta Neurologica*, 1970(Jan), Vol. 25(1), 1-58. Presents a documented, comprehensive study of all efforts and contributions regarding biological and therapeutic knowledge of schizophrenia from 1922-1970. Italian studies have shown that schizophrenia is not an enigma but a somatic disease, especially of the brain, liver, and intestine. 550 autopsies of the brain were made from 1922-1967. Foci are formed in the brain, and scattered in the cellular zones and nerve pathways: pathological changes are scattered in the nerve fibers. This "scattering" is the cause of the dissociative "psychic" symptoms. It is concluded that the best therapy for the schizophrenic is the 1 used in Italy: mobilizing the defense powers of the liver with the powerful help of

nucleotides. (German & English summaries)—A. M. Farfaglia.

1577. de Alarcon, R. & Carney, M. W. (Graylingwell Hosp., Chichester, England) **Severe depressive mood changes following slow-release intramuscular fluphenazine injection.** *British Medical Journal*, 1969(Sep), Vol. 3(5670), 564-567.—16 patients in whom schizophrenia was initially diagnosed and who were treated with fluphenazine enanthate or decanoate developed severe depression for a short period after the injection. In 5 cases this depression is thought to have been responsible for suicide. In 8 out of 10 cases the depression responded to ECT. It is recommended that patients who are treated with fluphenazine should be carefully supervised for the early detection of relapses or changes in the course of the illness.—*Journal abstract.*

1578. Ferholt, Julian B. & Stone, Walter N. (Veterans Administration Hosp., Cincinnati, Ohio) **Severe delirium after abrupt withdrawal of thiothixene in a chronic schizophrenic inpatient: A case study.** *Journal of Nervous & Mental Disease*, 1970(May), Vol. 150(5), 400-403.—Describes a 46-yr-old man with a chronic schizoaffective psychosis who was treated with thiothixene (navane), 30 mg. daily for 57 days. After abrupt withdrawal of the drug he developed a severe acute brain syndrome lasting for 7 days. This was not controlled with a phenothiazine, but was quickly brought under control with reinstitution of the thiothixene. No evidence of permanent damage was found.—*Journal abstract.*

1579. Goldstein, Kenneth S. (U. Tennessee) **The effect of imposed patient-groupings upon symptom fluctuation.** *Dissertation Abstracts International*, 1970(Nov), Vol. 31(5-B), 2984.

1580. Gorskiĭ, G. D. & Rybakov, V. L. (Novgorod Psychiatric Hosp., USSR) **Primenenie llogena dlya lecheniya konechnykh sostoyaniĭ shizofrenii s katatonicheskoi simptomatikoĭ.** [Use of lyogen for treatment of terminal states of schizophrenia with catatonic symptomatology.] *Zhurnal Nevropatologii i Psikiatrii*, 1970(Oct), Vol. 70(10), 1575-1578.—Presents results of the use of lyogen (40 mg/day) in treating 17 21-56 yr. old schizophrenics whose unfavorably developing psychosis of 6-32 yr. duration was terminally catatonic. 5 of the 10 with primary catatonia experienced a brief slight improvement. In 3 out of 7 with secondary catatonia, a distinct remission occurred which could be sustained with reduced dosage (8-10 mg/day). In the latter, the characteristic predominance of delusional over hallucinatory disorders throughout the course of the psychosis was observed—a fact which is taken as significant for understanding the therapeutic effect of lyogen. (English summary)—I. D. London.

1581. Kassoria, Irene. **For catatonia: Smiles, praise and a food basket.** *Psychology Today*, 1969(Jun), Vol. 3(1), 38-41.—Applied behavior modification principles to a catatonic and mute schizophrenic male who had not spoken in 30 yr. After 138 days of training the patient improved from giving essentially no responses to a 120 question verbal test to being able to answer correctly 75% of the time. A yr. after training ended the patient was still talking and working with occupational therapists.—E. J. Posavac.

1582. Katkin, Steven; Ginsburg, Marshall; Rifkin, Marilyn J., & Scott, James T. **Effectiveness of female volunteers in the treatment of outpatients.** *Journal of Counseling Psychology*, 1971(Mar), Vol. 18(2), 97-100.

—Investigated the effectiveness of female volunteer therapists to reduce hospital recidivism using female schizophrenic outpatients. 36 Ss were seen by the volunteers in supportive therapy and a comparable control group of 36 Ss received no supportive therapy. At the end of 1 yr., recidivism rates in the volunteer therapist group were significantly lower than in the control group. The majority of recidivists in both groups had returned by the 4th mo. This finding suggests that the 1st 4 mo. of the patient's stay out of the hospital may require special attention from outpatient treatment programs.—*Journal abstract.*

1583. Ko, Yung-ho. (U. Michigan) **The relationship between institutionalization and attention breadth in schizophrenia.** *Dissertation Abstracts International*, 1970(Nov), Vol. 31(5-B), 2991-2992.

1584. Kutsenok, B. M. & Zolotnitskiĭ, R. I. (Kiev Medical Inst., USSR) **Terapevicheskie rezul'taty i oslozhneniya pri primenenii llogena u dlitel'no boleyushchikh shizofreniĭ.** [Therapeutic results and complications in the use of lyogen in schizophrenia of long duration.] *Zhurnal Nevropatologii i Psikiatrii*, 1970(Oct), Vol. 70(10), 1578-1583.—Subjected 91 schizophrenics (for 75 of whom the duration of the psychosis exceeded 10 yr.) to treatment with lyogen, a phenothiazine derivative. No remissions of Type A were observed; Type B—17.6%; Type C—32.9%; Type D—45.1%; and no improvement—4.4%. If a positive effect was observed, it occurred in the 1st few days of treatment and was maximal in the 2nd and 3rd wk. 41.8% suffer complications (convulsive effects, allergic states, vascular disturbances, etc.). It is concluded that lyogen is an effective drug in the treatment of long-standing schizophrenia. However, the difference between therapeutic and toxic doses is so small that its use often entails neuropsychic complications. (English summary)—I. D. London.

1585. Lassner, Rudolf & Brassea, Margie. (Colorado State Hosp., Pueblo) **Family centered group therapy with chronic schizophrenic patients: A five-year follow-up study.** *Group Psychotherapy*, 1968(Dec), Vol. 21(4), 247-258.—For 12 mo., 7 hospital-habituated male schizophrenics were involved in conjoint, family-centered therapy. 5 yr. later, 6 are living in the community. Although other hospital factors were involved, it was felt that the therapy was crucial to this overwhelming success.—A. Krichev.

1586. Owen, Terry W. (U. Illinois, Urbana-Champaign) **The effects of social stimuli on schizophrenic performance and satisfaction.** *Dissertation Abstracts International*, 1970(Nov), Vol. 31(5-B), 3000.

1587. Ozola, M. Ya. (Riga Medical Inst., USSR) **Terapevicheskie patomorfizy shizofrenii, protekayushcheĭ s paranoïdnyimi rasstroïstvami.** [Therapeutic pathomorphosis of schizophrenia, proceeding with paranoid disorders.] *Zhurnal Nevropatologii i Psikiatrii*, 1970(Apr), Vol. 70(4), 600-605.—Reports results of observations of 77 paranoid schizophrenics (34 with a continuous-progressive form of psychosis, and 43 with an attacklike form) in a study of the influence of neuroleptic therapy on the course of the psychosis, and a comparative evaluation of the therapeutic effectiveness of neuroleptics, e.g., aminazine (chlorpromazine), triphthazine, haloperidol, and majoetil, and insulin in paranoid schizophrenia. Neuroleptic therapy exerted no essential influence on the main patterns of development of the schizophrenic process. In the attacklike form.

however, neuroleptic therapy did exert some influence on the course and psychopathological disturbances of the psychosis, intensifying its characteristics. In the continuous-progressive course, neuroleptic therapy chiefly affected those disorders reflecting an intensification of the pathological progress (catatonic disorders and symptoms of psychic automatism). The major determinative symptoms (verbal hallucinations, delusions, and other disorders), however, were extremely resistant to neuroleptic therapy. Insulin-shock therapy was not as effective as neuroleptic therapy. (English summary) (34 ref.)—*I. D. London.*

1588. Prien, Robert F., Levine, Jerome, & Switalski, Richard W. (Veterans Administration Hosp., Central Neuropsychiatric Lab., Perry Point, Md.) **Discontinuation of chemotherapy for chronic schizophrenics.** *Hospital & Community Psychiatry*, 1971(Jan), Vol. 22(1), 4-7.—In 2 experiments, an attempt was made to identify subgroups of chronic schizophrenics with a sufficiently low probability of relapse to warrant discontinuation of medication. In Exp. I, 60 men and 60 women were chosen from each of 7 public mental hospitals (total N=840). Ss were assigned to 1 of 4 groups, receiving either 300 or 2000 mg. of chlorpromazine per day, a placebo, or the physician's choice of medication and dosage. The clinical status of each S was assessed by overall psychiatric judgments of degree of improvement on the Global Change Scale and by specific psychopathology as rated by psychiatrists, nurses, and social workers. In Exp. II, 360 patients were randomly assigned to 1 of 3 groups receiving either 15 or 80 mg. of trifluoperazine per day or a placebo. In both studies, the placebo group had significantly higher relapse rates. Relatively few relapses (12%) occurred during the 1st 5 wk. on placebo. Relapse was found to be significantly related to the dose of tranquilizing medication the patient was receiving before he was put on placebo—the higher the dose the greater the probability of relapse. In both studies the difference in relapse rate between low dose and each of the other dose levels was significant at the .05 level. Results indicate that the large majority of schizophrenics who have been hospitalized for more than 15 yr. and who are receiving low doses of tranquilizing medication can remain off drugs for 6 mo. without deleterious effects.—*R. Sivley.*

1589. Skalny, V. V. (Volyn Provincial Psychiatric Hosp., USSR) **Ob effektivnosti lecheniya bol'nykh shizofreniei vitaminom B₁₂ odnovremennno s insulinom.** [On the effectiveness of simultaneous treatment of schizophrenics with vitamin B₁₂ and insulin.] *Zhurnal Nevropatologii i Psikiatrii*, 1970(Nov), Vol. 70(11), 1718-1721. Presents a clinico statistical analysis of the frequency of remissions with a duration of over 1 yr. in (a) 115 cases of schizophrenia, treated with small doses of insulin (8-16 units daily subcutaneously) in combination with vitamin B₁₂ (200 µg intramuscularly); and (b) 111 cases, treated only with insulin in the usual doses. Forms of schizophrenia which appeared in the experimental and control groups were: hallucinatory-paranoid, paranoid, simple, and catatonic. The duration of the psychosis was from 3 to over 5 yr. It is shown that the 1st of these methods of treatment has a higher degree of therapeutic effectiveness. (English summary)—*I. D. London.*

1590. Sobell, Linda C., Schaefer, H. H., Sobell, Mark B., & Kremer, M. Elise. (Patton State Hosp., Calif) **Food priming: A therapeutic tool to increase the per-**

centage of meals bought by chronic mental patients. *Behaviour Research & Therapy*, 1970(Nov), Vol. 8(4), 339-345.—In a motivating ward environment for schizophrenics, 3 methods of maximizing food as an effective reinforcer were tested. On the basis of pretreatment measures, patients were classified as "non-chronic meal misers" who served as control patients (Group A), "chronic meal misers" because they had no tokens (Group B), or "chronic meal misers" because they chose not to eat but had tokens (Group C). 1 of the following 3 experimental treatments was then administered when a patient missed a meal: (a) visual food priming (observing others eat), (b) oral food priming (sampling 1 teaspoon of each type of food for that meal), and (c) free meal (being offered a free meal when it was missed). Oral and visual food priming were found to be equally effective in increasing the percentage of meals bought by patients. A posttreatment follow-up for Group B found that this increase was even greater during the follow-up phase. The percentage of meals bought by the patients during the free meal condition of Group B decreased during the treatment phase but was significantly above pretreatment measures during the follow-up phase, suggesting that complete reinforcer sampling may also be an effective technique for increasing the percentage of meals bought.—*A. Barclay.*

1591. Wexler, Milton. (465 N Roxbury Dr., Beverly Hills, Calif.) **Schizophrenia: Conflict and deficiency.** *Psychoanalytic Quarterly*, 1971(Jan), Vol. 40(1), 83-99. It is suggested that the couch and free-association methods "are not only inappropriate but dangerous with psychotic patients. . . . Clinical experience with patients who decompensate in the course of psychoanalytic treatment points up a wide variety of symptoms closely associated with a loss of internal object representation and a variety of urgent institutional efforts. These reinforce Freud's thesis that schizophrenia is to be sharply differentiated from neurosis, with loss of object representation in the former and retention of such representations in the unconscious in the latter. These concepts clearly suggest specific technical approaches in the treatment of schizophrenic patients. They also raise the general question as to whether there is value in differentiating more sharply between conflict disorders and deficiency disorders."—*J. Z. Elias.*

PSYCHOSOMATIC DISORDER

1592. Cochrane, Raymond. (Michigan State U.) **High blood pressure as a psychosomatic disorder: A selective review.** *British Journal of Social & Clinical Psychology*, 1971(Feb), Vol. 10(1), 61-72. Reviews medical, psychological, and sociological studies of high blood pressure for criterion supporting the view that hypertension is a psychosomatic disorder. The enormous amount of literature produced to date supports the idea of a link between perceived stress in the environment, a personality overreactive to stress, and high blood pressure. The specific mechanisms involved have not as yet been clearly identified. The literature is reviewed in the areas of personality and hypertension, experimental elevation of blood pressure, environmental factors in hypertension, and explanations of high blood pressure (59 ref.)—*Journal abstract.*

1593. Fanai, F. (Municipal Hosp., Neurologic-Psychiatric Clinic Frankfurt, W. Germany) **Die Hochschulpneumonie und Probleme ausländischer**

Studenten: Eine Studie über die Häufigkeit und Pathogenese akuter funktioneller Beschwerden bei iranischen Studenten unter besonderer Berücksichtigung der Autoritätsproblematik. [Psychiatry at the university and problems of foreign students: A study on the frequency and pathogenesis of acute functional disturbances in Iranian students with special consideration given to authority problems.] *Psychiatria Clinica*, 1970, Vol. 3(6), 365-374.—Presents a report concerning the pathogenesis and the frequency of acute functional complaints referred to various organs in 64 "healthy" students from Iran. Particular attention was given to their authority conflicts. An attempt was made to show the causal connections between those complaints and fear of authority, itself brought about by an authoritarian upbringing. Autogenic training is suggested as suitable therapy. (27 ref.)—*English summary.*

1594. **Mason, J. W.** (Walter Reed Army Inst. of Research, Washington, D.C.) **Strategy in psychosomatic research.** *Psychosomatic Medicine*, 1970(Jul), Vol. 32(4), 427-439.—Reviews the evolution of psychosomatic theory and the increasing need for interdisciplinary research at an increasingly sophisticated level.—*W. G. Shipman.*

1595. **Strojnowski, Jerzy.** **Szkic rozwoju ważniejszych teorii psychofizjologicznych od starożytności do oświecenia.** [Outline of the development of some important psychophysiological theories from Antiquity to the Enlightenment.] *Roczniki Filozoficzne: Annales de Philosophie*, 1969, Vol. 17(4), 33-52.—Outlines the development of knowledge of psychosomatic relationships from 600 B.C. until the present time. The question of dualism is still considered unresolved at the present time. 4 steps or trends are recognizable: (a) the cosmological approach of the old school, (b) the role of interrelationship between physical and material phenomenon, (c) evolutionary ideas of psychic development, and (d) the current status of the problem. (English summary) (34 ref.)—*I. Holowsky.*

CASE HISTORY

1596. **Lebedev, B. V., Mazaeva, I. V., & Mladkovskaya, T. B.** (USSR Academy of Medical Sciences, Inst. of Pediatrics, Moscow) **K voprosu diagnostiki sindroma "koshach'ego krika."** [On diagnosis of the "cat's cry" syndrome.] *Zhurnal Nevropatologii i Psikiatrii*, 1970(Oct), Vol. 70(10), 1571-1574.—Analyzed the case of a 3½ yr. old with chromosomal deficiency leading to the development of the syndrome "cri du chat." In the child were observed mental retardation, arrested physical development, microcephaly, a characteristic mewing cry, epicanthus, and other physical atypicalities. A karyological examination disclosed the lack of a major part of the short arms of Chromosome 5. Diagnosis should be attempted in early infancy since 1 of the most characteristic signs—cri du chat—sometimes disappears by the 1st yr. (English summary)—*I. D. London.*

1597. **Schwartz, B. A. & Escande, C.** (Inst. National Santé de la Recherche Médicale, Paris, France) **Sleeping sickness: Sleep study of a case.** *Electroencephalography & Clinical Neurophysiology*, 1970(Jul), Vol. 29(1), 83-87.—Examined polygraphically a 66-yr-old patient with sleeping sickness 9 times in 4 mo. The 1st clinical symptoms of the disease had been observed 4 yr. previously. Throughout the study period wakefulness

and REM sleep were always normal while slow wave sleep (SWS) and intermediate sleep (Int. S) were always pathological. SWS was divided into 4 stages based on gradually increasing proportions of frontal delta waves as sleep deepened (from short bursts to continuous frontal delta waves). The majority of afternoon records and a night record showed early onset of REM sleep periods although clinically the S had no cataplectic or narcoleptic sleep attacks but continuous hypersomnolence. At certain moments hallucinations seemed to appear while the record showed Int. S. (French summary)—*Journal summary.*

1598. **Stinnett, James L. & Hollender, Marc H.** (U. Pennsylvania) **Compulsive self-mutilation.** *Journal of Nervous & Mental Disease*, 1970(May), Vol. 150(5), 371-375.—Self-mutilation as a compulsive act is rare; self-inflicted injury to the eyes, other than enucleation, is also rare. Only 2 instances of eye banging, similar to that of a 30-yr-old man whose history is presented, were found in the world literature. While S's disorder descriptively and psychodynamically was obsessive-compulsive, in terms of ego function it was that of a borderline state. An appraisal of the nature of ego function is considered more pertinent than an understanding of psychodynamics from the standpoint of therapy.—*Journal abstract.*

1599. **Vasquez, Julio.** (Hosp. Saint-Jean-de-Dieu, Montreal, Quebec, Canada) **Voyeurisme et photophobie: Un cas clinique.** [Voyeurism and photophobia: A clinical case.] *Interprétation*, 1970(Jan), Vol. 4(1-2), 165-186.—Summarizes a long and dynamic clinical study of a 49-yr-old voyeurist (a priest) who became photophobic prior to his admission to a Montreal hospital. Examples of his voyeurism throughout childhood, adolescence, and adulthood are progressively related. Factors contributing to his condition are described and include: a dominating mother, an intense fear of committing sin, a sexual obsession to see a woman with a penis, and extreme anxiety leading to fear of light, the sun, blindness, sleep, and madness. In addition to other indications contributing to a diagnosis of perversion and neurosis is the S's association of St. Thomas and St. Paul with voyeurism because they symbolize eternal happiness through beatific vision. It is concluded that the S recovered from his photophobia and became less active in his perversion after his treatment.—*S. Maze.*

MENTAL HEALTH & REHABILITATION

1600. **Calderón Narváez, Guillermo.** (Mental Health Dept., Mexico City, Mexico) **La salud mental en México: Antecedentes históricos y enfoque actual.** [Mental health in Mexico: Historical antecedents and present approach.] *Acta Psiquiátrica y Psicológica de América Latina*, 1970(Sep), Vol. 16(3), 234-239.—The history of psychiatry in Mexico goes back to the time before Cortés arrived; old codices describe that diseases like depression and epilepsy were considered as such, and not due to the spell of a malignant spirit. The importance of sociomedical aspects such as alcoholism, as well as their preventive and therapeutic approach, was also emphasized. After the conquest, the first psychiatric hospital in the continent was founded in Mexico City. At the present time, changes in mental health include the demolition of old asylums and the construction of new

institutions in accordance with modern psychiatric trends.—*English summary.*

1601. **Guernsey, Bernard G.** (Pennsylvania State U., Child & Family Consultation Center) **Alfred Adler and the current mental health revolution.** *Journal of Individual Psychology*, 1970(Nov), Vol. 26(2), 124-134.—Discusses the consonance of Adler's views with some of the current emphases in the mental health field, e.g., civil rights and poverty as mental health issues, rehabilitation to the community, prevention of mental health problems, nonprofessionals as psychotherapeutic agents, and democratic psychotherapeutic classrooms. (42 ref.)—*A. R. Howard.*

1602. **Hoxworth, David & Alsup, Theresa.** (Adams County Mental Health Center, Quincy, Ill.) **Group work with parents in a day care center.** *Hospital & Community Psychiatry*, 1968(Aug), Vol. 19(8), 256-258.—Describes discussion groups for parents of children from various economic and social levels at a day care center. The role of the worker is explored, and it was found that after 7 mo. the parents were discussing many facets of mental health.—*B. A. Burkard.*

1603. **Krasik, E. D., et al.** (Tomsk, Psychiatric Hosp., USSR) **Opty differentsirovannoi reabilitatsii psikhicheski bol'nykh.** [An experience with differentiated rehabilitation of the mentally ill.] *Zhurnal Nevropatologii i Psikiatrii*, 1970(Nov), Vol. 70(11), 1707-1712.—Recounts a 3-yr experience (1967-1970) with the differentiated rehabilitation of mental patients in a large psychiatric hospital (948 schizophrenics, 195 epileptics, 101 oligophrenics, 58 chronic alcoholics, 139 with organic and traumatic lesions of the brain, 54 other psychotics). The different stages in the rehabilitation of such patients and the necessary changes in the structure, personnel, and activity of the hospital are reported. The different forms of sociovocational rehabilitation are analyzed and their effectiveness gauged. (English summary)—*I. D. London.*

1604. **MacDonald, A. P.** (West Virginia U., Rehabilitation Research & Training Center) **Internal-external locus of control: A promising rehabilitation variable.** *Journal of Counseling Psychology*, 1971(Mar), Vol. 18(2), 111-116.—Discusses the relationship between internal-external locus of control and attitude toward and reaction to disability relative to 3 major disability classes: (a) social disadvantage, (b) physical disability, and (c) emotional disorders. Research literature leads to the conclusion that (a) externally controlled persons are more threatened by physical disabilities; (b) internals, relative to externals, view emotional disorders as more debilitating than physical disabilities; and (c) social disadvantage and minority group membership are conducive to the development of external control orientations. Evidence is presented which suggests that remedial programs can change control orientations. (22 ref.)—*Journal abstract.*

1605. **Miller, George A.** (Rockefeller U.) **Psychology as a means of promoting human welfare.** In F. F. Korten, S. W. Cook, & J. I. Lacey (Eds.), "Psychology and the problems of society." (See PA, Vol. 46:Issue 1) 5-21.

1606. **Sens, Lee.** (Texas Woman's U., Denton) **Occupational therapy for chronic patients.** *Hospital & Community Psychiatry*, 1968(Dec), Vol. 19(12), 380-381.—Describes the necessary elements of a dynamic treatment program for chronic regressed patients. These include recommendations that (a) the patient be ex-

pected to perform on an adult level, (b) initiative by the patient should be appreciated by the therapist, and (c) the patient should develop a sense of membership in a patient group having worthwhile goals.

COUNSELING & GUIDANCE

1607. **Anthony, William A.** (Southern Illinois U.) **A methodological investigation of the "minimally facilitative level of interpersonal functioning."** *Journal of Clinical Psychology*, 1971(Jan), Vol. 27(1), 156-157.—13 counselors were cast in the helping role with a physically disabled client for approximately 35-40 min. The high facilitative counselors were favored for the client's depth of self-exploration, the counselor's level of immediacy after confrontation by the client, the counselor's use of experimental confrontation, and the counselor's attitude toward disabled persons score. It is suggested that distinction must be made between high and moderate counselors and that Level 3 is a behaviorally meaningful cutoff score. *E. J. Kronenberger.*

1608. **Ashbrook, James B.** (Colgate Rochester Divinity School, Rochester, N.Y.) **Characteristics of parish counseling.** *Pastoral Psychology*, 1970(May), Vol. 21(204), 27-38.—No other professional person has such access to the inner world of people and is so accessible to them than the clergyman. The parish setting provides a full range of contacts and resources for "being for others." The counseling pastor's ultimate purpose and the penultimate and communion with a human community of faith that transcends all barriers. *O. Strunk.*

1609. **Bonnell, George G.** (1st Presbyterian Church, Plainfield, N.J.) **The pastor's role in counseling the depressed.** *Pastoral Psychology*, 1970(Jan), Vol. 21(200), 38-46.—Discusses the origins of depression and the danger signs of depression. It is suggested that pastors should (a) avoid dealing with unconscious materials, (b) not paint bright colors where there are none to paint, (c) not overinterpret, and (d) not lapse into the mood of the client. Also discussed are transference, countertransference, feelings of anger, and feelings of perfectionism. *O. Strunk.*

1610. **Boutte, Margaret A.** (North Texas State U.) **Play therapy practices in approved counseling agencies.** *Journal of Clinical Psychology*, 1971(Jan), Vol. 27(1), 150-152.—A 3-page 21-item questionnaire was sent to 99 approved counseling agencies to obtain knowledge concerning play therapy practices. Play therapy was used in 4 of every 10 accredited counseling agencies. 16 trends are presented. Wherever possible, the results of the study were compared with those of a 1959 study on child therapy practices. Psychoanalytic and directive theoretical orientations had declined significantly. No significant differences existed between the 2 studies for the use of the psychological examinations. Children in accredited child guidance clinics were influenced less by the nature of the problem in using or not using play therapy than they were in the previous study. Caution is urged in using the data from the present study, and replication is suggested. *E. J. Kronenberger.*

1611. **Byers, A. P.** (Deaconess Hosp., Grand Forks, N.D.) **Something of value in counseling.** *Pastoral Psychology*, 1970(May), Vol. 21(204), 49-55.—In the counseling relationship there is a person reaching out for

a responsible encounter with another person who is capable of responding with deep meaning from the very ground of his being. This kind of encounter is like a meeting with God himself.—O. Strunk.

1612. **Carkhuff, Robert R.** (American International Coll., Center for Human Relations & Community Affairs) **Training as a preferred mode of treatment.** *Journal of Counseling Psychology*, 1971(Mar), Vol. 18(2), 123-131.—Develops the concept of training significant others or clients as the preferred mode of effecting changes in the client's functioning. The 2 principal modalities converging upon training as treatment are the client-centered and behavior modification approaches. Training as a preferred mode of treatment is defined by the training programs in the following areas: (a) the interpersonal skills and other skills needed to function effectively; (b) the methods for developing effective courses of action; and (c) the means to implement the resultant programs. (67 ref.)—*Journal abstract*.

1613. **Farnsworth, Kirk E., Lewis, Edwin C., & Walsh, James A.** (U. New Hampshire) **Counseling outcome criteria and the question of dimensionality.** *Journal of Clinical Psychology*, 1971(Jan), Vol. 27(1), 143-145.—107 college counseling staff members and advanced graduate students completed a 180-item inventory of client changes. A factor analysis extracted 6 factors: objective vs. subjective criteria, maturity, inner- vs. other-directed behavior, conventionality, energetic and socially-approved behavior, and ability to deal with reality. Replication is suggested.—E. J. Kronenberger.

1614. **Gordon, Edmund W.** (Teachers Coll., Columbia U.) **Perspectives on counseling and other approaches to guided behavior change.** *Counseling Psychologist*, 1970, Vol. 2(2), 105-114.—States that the field of counseling should be radically changed or eliminated. Convinced that a person's consciousness, attitudes, and feelings are products of environmental encounters, an ecological model of personality is proposed, calling for the abolition of counseling by incorporating it in a new profession called "human developmental ecology." The developmental-ecological model warrants consideration of multiple interactions as well as the individual, making "control and modification of the system crucial to the development of the individual." In guiding behavior change, the professional (counselor) must expand choice alternatives, optimize decision behavior, and facilitate development and movement toward the chosen objects. This system's implications for counseling include a shift from: (a) individual appraisal to environment; (b) behavior product assessment to behavioral process; (c) prediction to prescription; (d) traditional concern for discovering the talented few to developing talent in all; (e) didactic exhortation to discovery and modeling; (f) interpretation to environmental orientation; (g) counseling to consultation; (h) diplomacy to advocacy; and (i) socialization to politicalization.—W. S. Sahakian.

1615. **Lum, Doman.** (Salvation Army, Men's Social Service Center, Honolulu, Hawaii) **Training lay counselors for church and community mental health.** *Pastoral Psychology*, 1970(May), Vol. 21(204), 19-26.—Describes pilot projects demonstrating volunteer training, including college students as companions to mental patients in the state hospital, middle-aged women as mental health counselors in outpatient clinics, and college graduates as mental health workers for socio-environmental therapy. The present responsibility of

pastoral counseling is to widen its boundaries to include such laymen in a meaningful way.—O. Strunk.

1616. **McGowan, John F.** (U. Missouri) **Counseling's social response.** In F. F. Korten, S. W. Cook, & J. I. Lacey (Eds.), "Psychology and the problems of society." (See PA, Vol. 46:Issue 1) 67-72.

1617. **Smith, William D. & Martinson, William D.** (U. Cincinnati) **Counselors' and counselees' learning style on interview behavior.** *Journal of Counseling Psychology*, 1971(Mar), Vol. 18(2), 138-141.—Investigated the therapeutic relationships of the counselor and the counselee by isolating differences that occurred with various combinations of impulsive counselors and counselees, constricted counselors and counselees, and by employing the method of Interaction Process Analysis developed by R. F. Bales. Counselees were 16 undergraduates, and counselors were 4 counseling center staff members. Significant differences were found in directive behavior between impulsive counselors and constricted counselors when both were interviewing impulsive counselees. Other trends also emerged.—*Journal abstract*.

1618. **Strong, Stanley R.** (U. Minnesota, Student Life Studies) **Experimental laboratory research in counseling.** *Journal of Counseling Psychology*, 1971(Mar), Vol. 18(2), 106-110.—Laboratory-based experimental counseling research answers questions about counseling and avoids the ethical problems attending experimental research in the counseling office. Laboratory events differ from other events only in that laboratory events are created for research purposes. Implications to real counseling of the results of contrived laboratory research are a function of bridging counseling theories. Applications are a function of theory and the effects of the boundary conditions of counseling, which is a conversation between persons of unequal status, of some duration, in which 1 participant is motivated to change and may be psychologically distressed. Laboratory research which evaluates relevant hypotheses and attends to boundary conditions fills the gap between basic research and counseling practice. (22 ref.)—*Journal abstract*.

1619. **Swenson, Edwin A.** (School of Theology, Claremont, Calif.) **An examination of the effectiveness of counseling as a function of socio-economic status and goal congruence.** *Dissertation Abstracts International*, 1970(Nov), Vol. 31(5-B), 3011.

1620. **Wolf, Sidney.** (Catholic U. of America) **An investigation of counselor type, client type, level of facilitative conditions and client outcome.** *Dissertation Abstracts International*, 1970(Nov), Vol. 31(5-B), 3013.

Marriage & Family

1621. **Earle, Ralph H.** (School of Theology, Claremont, Calif.) **Family group therapy: A relevant model for the pastoral counselor.** *Dissertation Abstracts International*, 1970(Nov), Vol. 31(5-B), 2980-2981.

1622. **Hofman, Kees C.** (Michigan State U.) **Marital adjustment and interaction, related to individual adjustment of spouses in clinic and non-clinic families.** *Dissertation Abstracts International*, 1970(Nov), Vol. 31(5-B), 2987.

1623. **Horowitz, Darlene B.** (New York U.) **The relevance of individual interpersonal expectations, styles of response to provocation, and interaction factors, to interpersonal behavior and satisfaction in**

marriage. *Dissertation Abstracts International*, 1970(Oct), Vol. 31(4-B), 2255-2256.

Social Casework

1624. Fuller, Theron K. (Dept. of Health, Education, & Welfare, Washington, D.C.) **Computer utility in social work.** *Social Casework*, 1970(Dec), Vol. 51(10), 606-611.—Social work has almost totally ignored the functional contributions the computer is able to make. For administrators, a centralized filing system has implications and substantial rewards. For caseworkers, the use of a remote access system could make intake a completely automated process. Computers could be programmed to take social histories. Present computer techniques bring research within range of almost every practicing social worker.—M. W. Linn.

1625. Silverman, Phyllis R. (Harvard Medical School, Boston, Mass.) **A reexamination of the intake procedure.** *Social Casework*, 1970(Dec), Vol. 51(10), 625-634.—17 low-income clients and their caseworkers were interviewed regarding their experiences during intake procedures. Clients represented those who dropped out after initial contact, those who began treatment, and those who completed treatment. There was little agreement among clients and workers about what was appropriate helping. Both behaved as a result of their own definitions of their roles.—M. W. Linn.

1626. White, Colby L. (Dept. of Health & Social Services, Roswell, N.M.) **Untangling knots in casework with the experiential approach.** *Social Casework*, 1970(Dec), Vol. 51(10), 612-617.—An experiential approach which utilizes aggressive, stimulating, reality-oriented therapy can put the client in closer touch with the real substance of a problematic situation. This approach emphasizes understanding the what and how of one's behavior as it occurs in the context of the here and now.—M. W. Linn.

PHYSICAL HANDICAP

1627. Cull, John G. & Hardy, Richard E. (Virginia Commonwealth U.) **Correlation between the Immediate Test and the Wechsler Adult Intelligence Scale verbal scale in the rehabilitation setting.** *Journal of Psychology*, 1971(Mar), Vol. 77(2), 203-205.—Administered the Immediate Test: A Quick Verbal Intelligence Test and the WAIS Verbal scale to 54 severely handicapped persons in a physical medicine and rehabilitation hospital. There was no significant difference between the mean IQ scores of the 2 tests. This, coupled with a correlation of .797 supports the hypothesis that the Immediate Test can be utilized for a quick assessment of intellectual functioning in the rehabilitation setting.—Author abstract.

Blindness & Visual Disorder

1628. Hare, Betty A., Hammill, Donald D., & Crandell, John M. (Temple U.) **Auditory discrimination ability of visually limited children.** *New Outlook for the Blind*, 1970(Nov), Vol. 64(9), 287-292.—Selected data from a pool of information on 85 visually limited and 77 sighted children from private residential and public schools in the greater Philadelphia area. Sound discrimination ability was measured by Form A of the

Irwin Sound Discrimination Test, in which the S indicates verbally whether or not pairs of words are the same or different. In order to demonstrate the relationship of sound discrimination to the other key input modality, a test of tactile-kinesthetic discrimination was administered individually to each S. The visually limited did not demonstrate superior sound discrimination ability. No relationship was found between visual acuity and sound discrimination ability. No significant relationship was found between auditory discrimination ability and tactile-kinesthetic skills.—S. R. Diamond.

1629. Harrison, A., Lairy, G. C., & Leger, E. M. (Inst. National de la Santé de la Recherche Médicale, Paris, France) **EEG et privation visuelle.** [The EEG and visual deprivation.] *Electroencephalography & Clinical Neurophysiology*, 1970(Jul), Vol. 29(1), 20-37.—Studied the EEGs of children with complete blindness or severe visual defects. Findings in 17 Ss who were blind or had only perception of light confirmed the classical findings: (a) marked changes in background rhythm, often with a rolandic or parietal distribution of an activity of alpha frequency; and (b) occipital foci of spikes, which occurred mainly in Ss over 5 yr. of age. In 100 Ss 18 yr. old Ss with significant visual defects but a useful residual acuity of 2/100-3/10, the EEG variables were studied in relation to age, residual acuity, and IQ; the etiology of the ocular condition was considered as well as the possibility of organic cerebral disease, independent or not of ocular lesion. Statistical investigation of Ss and the longitudinal study of some cases, support the conclusion that the interpretation of the EEG in blind or partially sighted children cannot be made in relation only to the quantitative loss of vision, but must also take account of the existing adaptation to the visual defect. (19 ref.)—English summary.

1630. Kalverboer, A. F., le Couteur, R., & Casier, P. (State U. Hosp., Groningen, Netherlands) **Implications of congenital ophthalmoplegia for the development of visuo-motor functions: Illustrated by a case with the Moebius syndrome.** *Developmental Medicine & Child Neurology*, 1970(Oct), Vol. 12(5), 642-654. Reports the case of a 12-yr-old boy with Moebius syndrome, with severely restricted horizontal and vertical eye movements but without other gross motor disturbances. He had a verbal IQ of 92, very poor performance on visuomotor tasks, yet normal reading, writing, and spelling ability. (23 ref.)—P. W. Pruyser.

1631. Nichols, W. H. (Nationwide Insurance Co., Columbus, O.) **Blind persons in data processing: The attitude of industry.** *New Outlook for the Blind*, 1970(Nov), Vol. 64(9), 293-296.—Presents the attitude of industry concerning the employment of blind in data processing from the viewpoint of top, middle, and line management. Top personnel officers tend to be very cautious about hiring the blind for these types of positions. Middle management is also very skeptical. The questions of line management are geared more to the practical aspects of the day-to-day operation. In the area of the technical understanding of the equipment, however, the blind programmers tend to have a better understanding than the sighted ones. Despite the resistance, the introduction of blind persons into the field of data processing is encouraging.—S. R. Diamond.

1632. Yates, James T. (U. Denver) **Loudness perception of the blind and sighted as described by equal-loudness contours.** *Dissertation Abstracts International*, 1970(Oct), Vol. 31(4-B), 2348.

Deafness & Hearing Disorder

1635. Cohen, Manuel M. & Schleifer, Annette B. (New York U.) Effect of age and interest time interval upon the initial and re-check speech discrimination test results of hearing aid users. *Journal of Auditory Research*, 1969(Oct), Vol. 9(4), 332-334.—Audiologic data were transcribed for 50 11-81 yr. old males and 50 10-90 yr. old females, selected from the files of a hearing aid clinic. Phonetically balanced word stimuli discrimination scores (DSs) were examined for effect of sex, age, and lapsed interval between initial hearing aid evaluation and a recheck up to 2 mo. and more later. There were no sex differences. Those Ss above the median (63.6 yr.) had significantly worse recheck DSs than younger Ss. Older Ss did significantly worse on recheck than on initial evaluation. Lapsed interval was significant: after 2 mo. DSs declined.—*Journal summary*.

1638. Zakia, Richard D. & Haber, Ralph N. (Rochester Inst. of Technology) Sequential letter and word recognition in deaf and hearing subjects. *Perception & Psychophysics*, 1971(Jan), Vol. 9(1-B), 110-114. Examined the processing of sequentially presented letters of familiar and nonsense words, especially among Ss of vastly differing experience on sequential tasks, 3 groups of Ss were tested on letters of words spelled sequentially on an alphanumeric display and on letters of words fingerspelled. Ss were 33 deaf and 19 hearing undergraduates, and 6 deaf and 6 hearing teachers who were highly proficient in finger spelling. Deaf Ss varied in their fingerspelling ability. Of principal interest was the finding that hearing Ss did better on nonsense letter recognition, while the deaf group did better on word recognition. Word length was important except to the staff Ss on fingerspelled words, which also suggests that concentration on fingerspelling proficiency forces attention to the whole word and not its component letters. Hearing Ss, who were the group faced with an unfamiliar task, seemed to attend to each letter and hence had more difficulty with recognition of the longer unit.—*Journal abstract*.

speech and selected physiological correlates in young adult stutterers during chemically induced anxiety. *Dissertation Abstracts International*, 1970(Nov), Vol. 31(5-B), 3054.

1641. Kovalev, V. V. & Kirichenko, E. I. (Central Inst. for Advanced Medical Training, Moscow, USSR) K voprosu o dinamike rechevykh i psikhicheskikh narushenii u detei i podrostkov s sindromom motornoi alalii. [On the dynamics of speech and mental disturbances in children and adolescents with the syndrome of motor alalia.] *Zhurnal Nevropatologii i Psikiatrii*, 1970(Oct), Vol. 70(10), 1561-1565.—Presents results of observations of 123 8-17 yr. old children and adolescents with underdeveloped speech involving motor alalia. Analysis of the data disclosed a distinctive mental insufficiency, distinguishable from oligophrenia in both the degree and structure of the defect. A reexamination of obsolete views of alalia as being a consequence of "local damage [combined] with intactness of the intellect" is suggested. This form of speech pathology is not isolated, but interconnected with mental impairment, making it an aspect of a particular variety of mental retardation. The major symptoms of the mental defect in motor alalia are due to an overall deficiency in those forms of cognitive activity intimately connected with internal and external speech. In diagnosing this form of underdevelopment of speech, it is necessary to consider general mental underdevelopment, and differentiate symptoms due to underdevelopment from symptoms connected with organic damage and secondary social deprivation. (English summary) (21 ref.)—*I. D. London*.

NEUROLOGICAL DISORDER

1642. Al'perovich, P. M. & Rudaya, B. I. (Pirogov Medical Inst., Vinnitsa, USSR) Klinicheskie formy i techenie sovremennogo epidemicheskogo (letargicheskogo) entsfalita. [Clinical forms and course of contemporary epidemic (lethargic) encephalitis.] *Zhurnal Nevropatologii i Psikiatrii*, 1970(Aug), Vol. 70(8), 1129-1134. Presents an analysis of materials on 250 cases of epidemic encephalitis observed over a 25-yr period (1944-1968). 4 clinical forms appear to be characteristic of contemporary epidemic encephalitis: lethargic, hyperkinetic, grippoid, and vestibular. The acute period in the 1st 2 forms presented a developing clinical picture which was much milder than during pandemic and was often abortive. Termination with parkinsonism was often observed, especially after the lethargic and grippoid forms. Parkinsonism developed much more often without a preceding acute period than during pandemic. (English summary) (25 ref.)—*I. D. London*.

1643. Bogan, Joseph B. (U. Oklahoma) The child rearing attitudes of parents of cerebral palsied children and their relationship to child adjustment factors in rehabilitative therapies. *Dissertation Abstracts International*, 1970(Nov), Vol. 31(5-B), 2976-2977.

1644. Bogolepov, N. K., Arbatskaya, Yu. D., & Gaponova, Yu. G. (2nd Moscow Medical Progn Inst., USSR) Klinika i eksperimentizatsiya trudospobnostei bol'nykh s posttraumaticheskimi i postentsfaliticheskimi parkinsonizmami i voprosy differentsial'noi diagnostiki. [Clinical picture and evaluation of working capacity of those suffering from post-traumatic and postencephalitic parkinsonism and the problems of differential diagnosis.] *Zhurnal Nevropato-*

logii i Psikhatrii, 1970(Sep), Vol. 70(9), 1325-1333. —Presents the results of observations of 13 cases of posttraumatic parkinsonism and 70 cases of encephalitic parkinsonism, along with determinations of degree of disability and working capacity. Illustrative EEGs and EMGs are reproduced. (English summary) (24 ref.)—*I. D. London*.

1645. Bogolepov, N. K., Martynov, Yu. S., Malkova, E. V., & Tsvil'ko, V. S. (2nd Moscow Medical Inst., USSR) **Gepato-portal'naya entsefalomieliopatiya.** [Hepatoportal encephalomyelopathy.] *Zhurnal Nevropatologii i Psikhatrii*, 1970(Apr), Vol. 70(4), 496-506.—Reports observations of 54 16-63 yr. old patients with different diseases of the liver and biliary ducts, culminating in the development of hepatoportal encephalomyelopathy: 26 with a predominance of cerebral disturbances, 13 of spinal disturbances, and 15 with both. The results of pathohistological examinations of the brain and spinal cord for 9 decreased 18-53 yr. old patients are presented along with those of histochemical studies of the brain tissue and liver for Cu. Hepatoportal encephalomyelopathy is characterized by the absence of Cu in the brain tissues and liver and by polymorphic neuropsychic disorders manifested in extreme irritability and psychomotor excitation, weakening of memory and attention, mental impairment, various pyramidal and extrapyramidal disturbances, symptoms of oral automatisms, etc. (English summary)—*I. D. London*.

1646. Curzon, G., Goodwin-Austen, R. B., Tomlinson, E. B., & Kantamaneni, B. D. (National Hosp., Inst. of Neurology, London, England) **The cerebrospinal fluid homovanillic acid concentration in patients with parkinsonism treated with L-dopa.** *Journal of Neurology, Neurosurgery & Psychiatry*, 1970(Feb), Vol. 33(1), 1-6.—The response of 8 patients with parkinsonism to treatment with L-dopa was studied and correlated with changes in the homovanillic acid (HVA) concentration in the cerebrospinal fluid. Before treatment HVA concentration was low or undetectable in all Ss but after treatment it rose to a level which correlated significantly with the dose of L-dopa. The lowest HVA levels after treatment were in the 2 Ss who showed no benefit. 1 S showed little therapeutic benefit but developed a relatively high HVA level. 2 Ss in whom clinical improvement was greatest had HVA levels intermediate between Ss who showed no response and those whose response was moderate or slight. It is suggested that increased brain synthesis of dopamine, as reflected by increased cerebrospinal fluid HVA levels, is necessary for a therapeutic response to L-dopa, but that increased brain dopamine synthesis does not necessarily lead to a therapeutic response. (22 ref.)—*Journal summary*.

1647. Dracheva, Z. N., Penek, N. V., & Shchurinov, L. A. (Kiev Medical Inst., USSR) **Vozrastnye osobennosti kliniki krovoizlivanii v golovnoi mozg.** [Age-specific features of the clinical picture of cerebral hemorrhages.] *Zhurnal Nevropatologii i Psikhatrii*, 1970(Jun), Vol. 70(6), 812-815.—42 30-75 yr. old patients were observed, in order to explicate the role of the age factor in the clinical picture of the acute period of hemorrhagic stroke, basically caused by high blood pressure. The 17 Ss in the younger group (30-45 yr.) exhibited general cerebral symptoms that were more marked, rapid development of comatose states, automatized gestures, hormetonia, oculomotor disorders, respiratory and cardiac disturbances. The 25 Ss in the older group (60-75 yr.) exhibited gradually developing

cerebral symptoms, which were not as pronounced as in the younger group. (English summary)—*I. D. London*.

1648. Filippycheva, N. A. & Faller, T. O. (Burdenko Research Inst. of Neurosurgery, Moscow, USSR) **Kharakteristika funktsional'nogo sostoyaniya golovnogo mozga pri gliomakh sredinno raspolozhennykh struktur bol'shikh polusharii.** [Characteristics of the functional state of the brain in gliomata of the medially placed hemispheric structures.] *Zhurnal Nevropatologii i Psikhatrii*, 1970(May), Vol. 70(5), 646-654.—Studied the physiological features characterizing cerebral activity in the presence of tumors at 2 levels of the middle hemispheric structures: the 3rd ventricular and callosoperiventriculo-septal regions (with the absence of intracranial pressure and a clinical picture for 9 patients, involving the amnesic syndrome and gross disorders of consciousness). Chosen as indices of cerebral function were the states of brainstem-cortical relationships, central regulation of cerebral and peripheral circulation, and central regulation of voluntary movements. In these patients the brain functions under conditions of: (a) marked disturbance of the nonspecific afferent flow of excitation from the regions of the brainstem as a result of its partial blockade; (b) gross pathological influences from the brainstem; and (c) stable, sharply expressed disturbance of cerebral circulation, probably producing a state of chronic hypoxia. (English summary) (37 ref.)—*I. D. London*.

1649. Freidkov, V. I. & Edel'shtein, E. A. (Central Inst. for Advanced Medical Training, Moscow, USSR) **Entsefaliticheskie reaktsii u detei.** [Encephalitic reactions in children.] *Zhurnal Nevropatologii i Psikhatrii*, 1970(Oct), Vol. 70(10), 1462-1465.—Presents results of observations of 116 children with different infections (most frequently respiratory), accompanied by general cerebral disorders known as "encephalitic reactions": convulsive seizures with loss of consciousness and, less frequently, psychomotor excitation with delusions, hallucinations, and confused mental states. Data confirm the necessity of conducting anticonvulsive, desensitizing, and dehydrating therapy during the infection, and for sometime afterwards. In cases of repeated infections this therapy should also be undertaken prophylactically together with the administration of hypothermic drugs. This is especially necessary in cases where there are observed cerebral defect, compensatory hydrocephaly, and allergic tendency. (English summary)—*I. D. London*.

1650. Goldstein, Steven G., Kleinknecht, Ronald A., & Gallo, Anthony E. (U. Oregon, Medical School) **Neuropsychological changes associated with carotid endarterectomy.** *Cortex*, 1970(Sep), Vol. 6(3), 308-322.—A long-held belief that carotid endarterectomy was prophylactic in nature rather than offering any restoration of function was evaluated by the use of an extensive neuropsychological battery of tests. 6 patients admitted to a neurosurgery service for carotid endarterectomy were evaluated just prior to surgery and approximately 3 mo. following surgery. All patients had presented complaints of transient ischemic episodes lasting seconds to minutes and then clearing totally. Analysis of the results indicated changes in all patients in the direction of improved performance. It was felt that increases in intelligence tests scores were most probably a function of practice and/or prior exposure. Improvement in performance on other measures was too great to be explained as practice effect, however, and the general

impression was one of restoration of measured neuropsychological ability as a function of the surgical procedure. It was pointed out that the performance of all Ss postsurgery was still similar to persons with cerebrovascular difficulties.—*R. Gunter.*

1651. Golovkin, V. I. (Kirov Military-Medical Academy, Leningrad, USSR) **Nepolnye autoantitela k mozgu pri nekotorykh zabolevaniyakh nervnoi sistemy.** [Incomplete cerebral autoantibodies in some diseases of the nervous system.] *Zhurnal Nevropatologii i Psikiatrii*, 1970(Jul), Vol. 70(7), 961-965.—Utilizing Steffens test ("the indirect reaction of antiglobulin fixation"), an attempt was made to disclose the presence of incomplete cerebral autoantibodies in the blood serum of 20 healthy Ss and 115 Ss with neurological diseases. Diagnostic groups of the latter included 32 with neuroses, 23 with vascular diseases, 33 with closed brain injury, 11 infected with lesions, 14 with multiple sclerosis and encephalomyelitis, and 2 with degenerative diseases. The findings provide evidence for the importance of the effects of autosensitization to the antigens of brain tissue in the pathogenesis of a number of diseases of the nervous system. "Incomplete antiglobulin-fixating free antibodies" exhibited a high organospecificity to nerve tissue and yielded reactions of various intensities to the antigens of the white and gray matter of the brain. (English summary)—*I. D. London.*

1652. Kalizhnyuk, E. S. (Serbskii Central Research Inst., Moscow, USSR) **K voprosu o zerkal'nom pis'me u detei s tserebral'nymi paralichami.** [On mirror writing in children with cerebral palsies.] *Zhurnal Nevropatologii i Psikiatrii*, 1970(Oct), Vol. 70(10), 1566-1571.—Observed 30 6-9 yr. old children with cerebral palsy (mainly dextral hemiparetics). In most Ss mirror writing occurred when the left hand was used; in 4 cases with both hands. No gross aphasic disorders or severe underdevelopment of cognitive activity were detected. Observations indicate that the elements of optospacial agraphy noted may be incorporated within Herstmann's syndrome (agraphy, alexia, digital agnosia, disturbed body conception, acalculia). "Compensatory-restorative" work, starting in early childhood, is indicated, with (a) emphasis on the training of the kinesthetic sensations; and (b) reliance on the child's visual perception of the spatial contours of the graphemes, promoted by a number of suggested methods. (English summary)—*I. D. London.*

1653. Khondkarian, O. A. (USSR Academy of Medical Sciences, Inst. of Neurology, Moscow) **Nekotorye aktual'nye voprosy problemy bokovogo amiotroficheskogo skleroza.** [Some high-priority questions concerning the problems of lateral amyotrophic sclerosis.] *Zhurnal Nevropatologii i Psikiatrii*, 1970(Apr), Vol. 70(4), 527-531.—Reports on observations of over 400 patients. The data justify the division of the disease into bulbar, cervicothoracic, and sacrolumbar forms from the clinical and pathomorphological viewpoint. Evidence is presented in behalf of another form of the disease, i.e., the so-called "superior (cerebral)" form. The data indicate that not all cases of lateral amyotrophic sclerosis can be considered as hereditarily involved. Some probably have a genetic basis, but most cases should be assigned to the group characterized by "slow" infections of the nervous system. In each individual case constitutional factors should also be considered. (English summary) (15 ref.)—*I. D. London.*

1654. Konovalova, G. I. (Central Inst. for Advanced

Medical Training, Moscow, USSR) **K klinike i techeniyu epidemicheskogo entsefalita u detei.** [On the clinical picture and course of epidemic encephalitis in children.] *Zhurnal Nevropatologii i Psikiatrii*, 1970(Oct), Vol. 70(10), 1450-1452.—Observed 21 5-mo to 16-yr-old patients with Economo's disease. It is concluded that: sporadic cases of the disease are encountered in children of all ages. The acute phase begins with heightened temperature and catarrhal symptoms. Symptoms of lesion of the nervous system emerge in most cases in the acute phase in the course of the 1st 2 wk. and point to localization of the pathological process in the di- and mesencephalic structures. The symptoms of the chronic period provided evidence for primarily brainstem-subcortical localization of the pathological cases; stable characterological changes also appeared; and in about 1/2 the cases a chronically progressive course was observed with the development of parkinsonism. (English summary)—*I. D. London.*

1655. Lavy, S., Carmon, A., Abramsky, O., & Feldman, S. (Hadassah U. Hosp., Jerusalem, Israel) [Evaluation of the therapeutic effects of L dopa in Parkinson's disease.] *Harefuah*, 1970(Dec), Vol. 79(12), 547-549.—Evaluated the short-term therapeutic effects of L-dopa in Parkinson's disease in a group of 20 patients in different stages of the disease. The patients were evaluated clinically and tested for motor performance before and after 1 mo. of treatment. Clinical evaluation included a 5-point scaling of rigidity, akinesia, and tremor. Motor performance was tested by an alternating movement efficiency test. The results of treatment with 2.5-4 gm. daily doses showed marked clinical improvement, especially with regard to akinesia and rigidity. Alternating motor performance improved significantly in all patients. The only side effects observed were confusion or emotional disturbances in 3 cases. These side effects disappeared after reducing the dose of the drug.—*English abstract.*

1656. Litvak, L. B. & Nyagu-Belyaeva, A. I. (Kharkov Research Inst. of Neurology & Psychiatry, USSR) **O "lakunarnom sostoyanii" mozga v ateroskleroticheskoi faze gipertonicheskoi bolezni.** [On the "lacunar state" of the brain in the atherosclerotic phase of hypertension.] *Zhurnal Nevropatologii i Psikiatrii*, 1970(Jun), Vol. 70(6), 801-808.—Reports results of clinico-pathomorphological examinations of 40 hypertensive cerebral atherosclerotics, and pathohistological examinations of 12 of them. A lacunar state of the brain was rather frequently detected, leading to the multiple development of lacunae, i.e., minute foci of cerebral destruction. The clinical picture included typical extrapyramidal motor disorders, pseudobulbar symptoms, gross memory impairment, and gross mental changes with emotional lability and progressive dementia. 2 periods of stroke-free progressive development of the pathology are discerned and described. This form of cerebral vascular pathology is rather widespread and not particularly confined to old age. (English summary)—*I. D. London.*

1657. Maumenko, A. I., et al. (1st Leningrad Medical Inst. USSR) **Ob izmeneniyakh vremeni provedeniya vzbuzhdeniya po dvigatel'nyim voloknam sredinnogo nerva pri sindrome zapyastnogo kanala.** [On changes in conduction-time for excitation along motor fibers of the median nerve in cases involving the carpal canal syndrome.] *Zhurnal Nevropatologii i Psikiatrii*, 1970(Nov), Vol. 70(11), 1656-1660.—Determined conduction-time (CT) for excitation along the motor

monosymptomatic narcolepsy the phase of "rapid" (paradoxal) sleep was absent from the structure of the attack; in polysymptomatic narcolepsy the attacks usually began with the "rapid" phase. Sometimes the "rapid" phase was accompanied by only some of its signs which, in turn, were combined with elements of "slow" sleep. It is suggested that the narcoleptic attack cannot be reduced to a paroxysm of "rapid" sleep and that its pathogenesis is considerably more complex. (English summary) (18 ref.).—*I. D. London.*

1664. Salzarulo, P. & Bergès, J. Au sujet des signes d'instabilité dans l'examen neurologique de l'enfant. [Signs of instability in the neurological examination of the infant.] *Archivio di Psicologia, Neurologia e Psichiatria*, 1969(Jan), Vol. 30(1), 37-47.—Neurological tests of 82 children with spontaneous postural instability indicated its important relationships with spontaneous motor instability, paratonia, limbs instability, and synkinesis. Different types of instability assume meaning in connection with modifications of neurological functions taken as a whole. Instability seems thus a way of approaching and investigating the theoretical problem of connections between motricity and psychomotricity.—*L. L'Abate.*

1665. Schachter, Mendel. (Committee of Child Defects, Marseille, France) Contribution à l'étude des accidents neurologiques et neuro-psychologiques consécutifs à des interventions sur la sphère orale (amygdaléctomies et adénoïdectomies). [Contribution to the study of neurological and neuro-psychological accidents subjected to surgical operations on the oral sphere (amygdaléctomies and tonsillectomies).] *Rivista di Psichiatria*, 1969(May), Vol. 4(3), 170-181.—The pathogenesis of 3 clinical cases is yet under discussion because of the relative scarcity of the published cases" despite the frequency of surgical intervention on this area in little children.—*N. De Palma.*

1666. Shefer, D. G., Skryabin, V. V., Myakoma, A. E., & Sakovich, V. P. (Sverdlovsk Medical Inst., USSR) Reoëntsefalografiya v diagnostike opukholei golovnogo mozga. [Rheoencephalography in diagnosis of brain tumors.] *Zhurnal Nevropatologii i Psikhatrii*, 1970(May), Vol. 70(5), 680-684.—Reports results of rheoencephalographic examinations of 116 18-50 yr. old patients with brain tumors and 55 healthy controls. The changes in the rheoencephalograph during the 3 stages of the hypertensive syndrome (compensation, sub-, and decompensation) are discussed. It is shown that a correlation exists between the clinical stage of intracranial hypertension and amplitude-frequency characteristics in the rheoencephalographic recordings. (English summary) (33 ref.).—*I. D. London.*

1667. Siroechkovskaya, M. E., et al. (Central Inst. for Advanced Medical Training, Moscow, USSR) Klinika polisezonnykh pervichnykh virusnykh èntsefalitov u detei. [Clinical picture of polyseasonal primary viral encephalites in children.] *Zhurnal Nevropatologii i Psikhatrii*, 1970(Oct), Vol. 70(10), 1457-1462.—Observed 114 cases in the acute period from 1965-1969. Such encephalites are encountered not infrequently and are characterized by a varied clinical picture and course. Most of the time the onset of the disease is acute, and sometimes very fast. The major focus of lesion is located in the oral parts of the brainstem and the subcortical nodes. In some cases the pathological process is very widespread, embracing almost all parts of the brain and extending into the spinal cord. Brainstem and diffuse

forms of encephalitis are the most serious of the pathological process. In 10% of polyseasonal encephalitic cases it was possible to establish an enteroviral etiology (English summary)—*I. D. London.*

1668. Sirotkin, V. M., Tretyakov, V. P., & Speranskii, V. I. (Kazan Medical Inst. USSR) O lechenii nibufinom dvigatel'nykh vazomotornykh narushenii i rasstroistv chuvstvitel'nosti u bol'nykh siringomieliiei. [On nibufin treatment of motor and vasomotor disturbances and of disorders of sensitivity in those with syringomyelia.] *Zhurnal Nevropatologii i Psikhatrii*, 1970(Dec), Vol. 70(12), 1810-1814.—Reports results of treatment of 95 syringomyeliacs with daily im injections (for 10-15 days) of 1 mg of nibufin: a phosphoric acid preparation (paranitrophenyl ether of dibutylphosphoric acid), possessing anticholinesterase properties and capable of (a) direct stimulatory action on the cholinoreceptive structures, and (b) alteration of cerebral serotonin level. The treatment led to favorable changes in the ergographic, dynamometric and reflexometric indices (simple motor reaction, thermesthetic time, amplitudinal and temporal parameters of the patellar reflexes, thermic vasomotor reflex). The therapeutic value of nibufin as a means for the mediator treatment syringomyelia is confirmed along with its superiority to armine and proserpine. In the doses applied, nibufin produced no side effects. (English summary) (17 ref.).—*I. D. London.*

1669. Skryabin, V. V., Sakovich, V. P., Myakota, A. E., & Oranskii, I. E. (Sverdlovsk Medical Inst., USSR) Sulochnyi ritm pul'sovogo krovenapolneniya mozga u zdorovykh i bol'nykh s povyshennym vnutricherepnym davleniem. [Daily rhythm of cerebral pulse in normals and those with heightened intracranial pressure.] *Zhurnal Nevropatologii i Psikhatrii*, 1970(Aug), Vol. 70(8), 1182-1186.—39 Ss participated in a study of the daily variations of magnitude of cerebral pulse. The ohmic amplitudinal index for pulse waves in the rheoencephalogram (R-E-G) underwent daily rhythmic change in both normals and those with heightened intracranial pressure. This index attained its greatest values during daytime; its least during nighttime. In normals the index for R-E-G pulse waves, recorded on the left, in most cases exceeded that for waves recorded on the right. In the course of the day, the magnitude of interhemispheric asymmetry changed. It attained greater dimensions during daytime; lesser during nighttime. In normals, keeping to a semihospital regimen, a close correlation was observed between daily changes in the ohmic amplitude of R-E-G pulse waves and those in the transverse rheograms of the body. A like correlation was not observed in those with heightened intracranial pressure under analogous regimen (English summary) (16 ref.).—*I. D. London.*

1670. Skvirskaya, K. B. (USSR Health Ministry, Central Research Roentgeno-Radiological Inst., Moscow) K probleme nasledstvennosti siringomieliiei. [On the problem of the inheritance of syringomyelia.] *Zhurnal Nevropatologii i Psikhatrii*, 1970(Sep), Vol. 70(9), 1281-1286.—Presents clinical reports of familial syringomyelia (SM) in 5 families undergoing prolonged observation. Sporadic forms of SM are almost identical. An absence of similarity in the clinical picture of SM in the Ss' families is noted. It is suggested that the concept of status dysraphicus be reexamined, since it is not central to the problem of tracing SM hereditary transmission. In any case, SM may be considered as a

disease associated with a hereditary predisposition, responding to the influence of other genetic factors and environmental impact (traumata, infections). (English summary) (15 ref.)—*I. D. London.*

1671. Sosnovik, I. L. (Vitebsk Medical Inst., USSR) **Fenokopii nekotorykh nasledstvennykh zabolevani, svyazannykh s diéntséfal'noi patologiéi.** [Phenocopies of some hereditary diseases related to diencephalic pathology.] *Zhurnal Nevropatologii i Psikiatrii*, 1970(Sep), Vol. 70(9), 1312-1316.—Describes cases of a hereditary disease in 1 family, marked by the appearance of 3 syndromes: myoplegia, myopathy, and myotonia. Results of clinical observations on a number of patients for whom these 3 syndromes bear a symptomatic character are reported. These phenocopies of genetically engendered diseases were shown to be produced by different exogenic factors, e.g., infections, surgical intervention, etc. The 3 syndromes appear in combination with other signs of diencephalic pathology. (English summary)—*I. D. London.*

1672. Vainshtok, A. B., Polyukhov, A. M., & Oleinik, L. I. (Inst. of Gerontology, Kiev, USSR) **O sostoyanii zhiro-lipidnogo obmena pri ateroskleroticheskom parkinsonizme v pozhilom vozraste.** [On the state of fatty-lipid metabolism in atherosclerotic parkinsonism in later years.] *Zhurnal Nevropatologii i Psikiatrii*, 1970(Jun), Vol. 70(6), 828-834.—Reports determinations of various indices of fatty-lipid metabolism and related indices in order to establish clinico-biochemical parallels in atherosclerotic parkinsonism in older people (60-74 yr.). (English summary) (24 ref.)—*I. D. London.*

Brain Damage

1673. Bobrov, A. S. (Central Research Inst. for Evaluation of Work Capacity & Trainability of the Disabled, Moscow, USSR) **K voprosu vozrastnoi dlinamiki otdalénnykh posledstvií zakrytoi cherepno-mozgovoi travmy.** [On the age-specific dynamics of remote sequelae of closed craniocerebral injury.] *Zhurnal Nevropatologii i Psikiatrii*, 1970(May), Vol. 70(5), 641-644.—Reports observations of 30 41-60 yr. old patients with closed craniocerebral injuries sustained during World War II. A stable worsening of symptomatology may ensue, following a compensatory period of considerable duration. In such cases the clinical picture was characterized by a polymorphic asthenic symptomatology combined with affective disorders and the appearance of traits not previously characteristic, such as anxiety. Mental disorders seriously diminished the working capacity of these individuals. (English summary) (15 ref.)—*I. D. London.*

1674. Boll, Thomas J. (U. Washington) **Correlation of WISC with motor speed and strength for brain-damaged and normal children.** *Journal of Psychology*, 1971(Mar), Vol. 77(2), 169-172.—Presents an investigation using 35 normal and 35 braindamaged children comparing performance on the WISC to performance with each hand on the Halstead Finger Oscillation Test and the Smedley Hand Dynamometer. Correlations were low for both groups between the WISC performance subtests and the motor tests—with the exception of Block Design for the control group. Significant correlations between the motor tests and several WISC verbal subtests were found for each group.—*Journal summary.*

1675. Brink, Joyce D., et al. (Rancho Los Amigos Hosp., Downey, Calif.) **Recovery of motor and intel-**

lectual function in children sustaining severe head injuries. *Developmental Medicine & Child Neurology*, 1970(Oct), Vol. 12(5), 565-571.—In 46 2-18 yr. old patients with severe head trauma (all with more than 1 wk. of coma, 38 initially decerebrate or decorticate, 21 with skull fractures, 28 had emergency craniotomies), significant recovery of motor function was found in the majority of cases after from 1-7 yr. But severe intellectual deficits prevailed, particularly in those with early trauma. Degree of recovery of motor and intellectual functions was related to duration of coma.—*P. W. Pruyser.*

1676. De Renzi, Ennio; Scotti, Giuseppe, & Spinnler, Hans. (U. Milan, Clinica delle Malattie Nervose e Mentali, Italy) **Perceptual and associative disorders of visual recognition.** *Neurology*, 1969(Jul), Vol. 19(7), 634-641.—2 hemispheric groups were given 4 visuo-perceptual tests: overlapping figures, face identification, the Farnsworth 100 Hue, and objective-figure matching. The 1st 3 tests were assumed to be demanding at the apperceptive level, while the 4th was much simpler but required the comprehension of the meaning of the items. Right brain-damaged patients with visual field defects were found to be specifically impaired on the 3 apperceptive tests. Left brain-damaged patients, in turn, performed with lowest scores on the object-figure matching test. There was a highly significant correlation in the left group, but not in the right, between the performance on the matching test and that on the Weigl abstract thinking test. Almost all right hemisphere patients who achieved poor scores on the matching tests were also impaired on the apperceptive tests, while this was not the case for about 1/3 of the left hemisphere patients. These findings are suggestive of a differential specialization between the 2 hemispheres in the process of visual recognition. The bearing of these data on Lissauer's classification of visual agnosia into an apperceptive and an associative form is discussed.—*F. O. Triggs.*

1677. Dee, H. L. & Benton, A. L. (U. Iowa, Neurosensory Center) **A cross-modal investigation of spatial performances in patients with unilateral cerebral disease.** *Cortex*, 1970(Sep), Vol. 6(3), 261-272.—Semmes has recently suggested that there are disorders of spatial ability which transcend a single sensory modality and which are not determined by elementary sensory defect. It was hypothesized that (a) there are disorders of spatial ability which transcend a single sensory dimension; and (b) such disorders are related to hemispheric locus of lesion. 4 groups of patients with unilateral cerebral lesions (unilateral left and right hemisphere patients, 1/2 of whom did and 1/2 of whom did not show constructional apraxia) were given tests of visual and haptic perception. Failure on the constructional tasks was as closely related to perceptual dysfunction in the haptic as in the visuospatial sphere. This relationship was obtained in patients with lesions in either hemisphere. There was no essential relationship between failure on the constructional or perceptual tests and aphasia, motor or sensory defect, or visual field defect. The findings are interpreted as being consistent with Hypothesis a but not with Hypothesis b.—*R. Gunter.*

1678. Faverman, Ya. S. (Republic Hosp., Beltsy, USSR) **Toksiko-allergicheskie porazheniya gipotalamicheskikh tsentrov, vyzvannye ursolom.** [Ursol-induced toxico-allergic lesions of the

hypothalamic centers.] *Zhurnal Nevropatologii i Psikhatrii*, 1970(Dec), Vol. 70(12), 1784-1790.—Ss were 197 fur- workers, having contact with ursol (para-phenylenediamine) dyes and displaying disturbances of the nervous system (cases of simultaneous ursol-induced bronchial asthma excluded). Results of a number of special examinations (biochemical, capillaroscopic, allergological, etc.) are presented. It is concluded that the level of lesion is primarily hypothalamic and that such lesion has an allergic genesis. (English summary) (17 ref.)—*I. D. London.*

1679. Gordon, Musetta C. (Veterans Hosp., Des Moines, Ia.) **Some effects of stimulus presentation rate and complexity on perception and retention in brain-damaged patients.** *Cortex*, 1970(Sep), Vol. 6(3), 273-286.—Compared the short-term memory recall performance of 36 brain-damaged Ss with the performances of 36 mentally retarded Ss and 36 normal controls for both total responses correct and for order errors. Stimuli were presented to all Ss at 3 rates, 40, 60, and 120 significant units per minute, and at 3 levels of stimulus concept complexity, simple, compound, and complex, at each rate. The performance of brain-damaged Ss was similar to that of the control group. The brain-damaged group did not make significantly more order errors than the normal controls. This was not true for the retarded who made significantly more order errors than both brain-damaged and normal Ss under all conditions. A comparison of small groups of left- and right-hemisphere-damaged Ss disclosed no differences in their ability to recall aurally perceived verbal material. Mirror-image error scores were significantly and positively related to verbal order scores for the right-hemisphere-damaged Ss. This relationship did not exist between the scores for the left-hemisphere-damaged Ss.—*R. Gunter.*

1680. Johnson, James E., Hellkamp, David T., & Lottman, Thomas J. (Loyola U., Chicago, Ill.) **The relationship between intelligence, brain damage, and Hutt-Briskin errors on the Bender-Gestalt.** *Journal of Clinical Psychology*, 1971(Jan), Vol. 27(1), 84-85.—WAIS and Bender Gestalt scores were obtained on 240 hospitalized patients and an analysis of results was performed to investigate the effectiveness of the Hutt-Briskin scoring system for the Bender Gestalt in differentiating normal from organic Ss for various IQ ranges. "The results indicated that this scoring system is relatively effective in indicating organicity only when used with patients in the borderline or dull normal IQ range."—*E. J. Kronenberger.*

1681. Rosen, Harold. (Veterans Administration Center, Wood, Wis.) **A comparison of two scoring systems for the Memory-for-Design Test.** *Journal of Clinical Psychology*, 1971(Jan), Vol. 27(1), 79-81.—49 brain-damaged patients were compared with a control group of 49 nonpsychotic patients on the Memory-for-Design Test (MFD). The diagnostic accuracy of 2 cutting scores is presented in table form. By excluding psychotics, detection of brain damage was significantly improved. 43% of the brain-damaged patients remained undetected by MFD, and this result is analyzed and discussed.—*E. J. Kronenberger.*

1682. Scotti, Giuseppe & Spinnler, Hans. (U. Milan, Clinic for Nervous & Mental Disorders, Italy) **Colour imperception in unilateral hemisphere-damaged patients.** *Journal of Neurology, Neurosurgery & Psychiatry*, 1970(Feb), Vol. 33(1), 22-28.—Investigated (a) the

influence of the hemispheric side of lesion, of the presence or absence of homonymous visual field defect, and of the interaction of these 2 factors on color discrimination; (b) whether the failure of control and brain-damaged patients was specifically related to certain sectors of the color spectrum; and (c) possible differences between the profiles of different subgroups. 80 control Ss, 101 left hemisphere-damaged patients (65 without and 36 with visual field defects), and 63 right hemisphere-damaged patients (39 without and 24 with visual field defects) were given the Farnsworth-Munsell 100 Hue Test (FMT). Only right hemisphere-damaged Ss with visual field defects were significantly impaired in comparison to the other groups, which did not differ among themselves. The difference between the right hemisphere-damaged Ss with visual field defects and the other subgroups was quantitative and not qualitative, since green-blue discrimination was found to be equally difficult for all Ss. When Ss with extremely poor FMT scores were identified, they were found to be impaired also on other noncolor perceptual tests. (32 ref.)—*Journal summary.*

1683. Sparks, Robert; Goodglass, Harold, & Nickel, Barbara. (Veterans Administration Hosp., Boston, Mass.) **Ipsilateral versus contralateral extinction in dichotic listening resulting from hemisphere lesions.** *Cortex*, 1970(Sep), Vol. 6(3), 249-260.—Presents a striking difference between the effects on verbal dichotic listening performance of left vs. right hemisphere lesions and examines the bearing of this observation on the mechanisms producing asymmetry of report from the 2 ears. A study is presented of verbal dichotic listening by 28 left-brain-injured aphasic patients and 20 right-brain-injured nonaphasic patients. The total population of the study was right-handed. The results reveal that the right-hemisphere-damaged group demonstrated exclusive extinction of the signals received by the contralateral left ear. The left-hemisphere-damaged group was divided between those who demonstrated extinction of the contralateral right ear and a significant number of Ss who demonstrated what might appear to be paradoxical extinction of the ipsilateral left ear. This ipsilateral extinction is presented as being less paradoxical by a model which postulates the competition between signals received by both ears occurs in the left hemisphere. The signal from the right ear arrives there directly via the more important decussating route but the information from the right hemisphere by anterior commissural fibers. By this model only a left hemisphere lesion can affect the information from either the contralateral or ipsilateral ear.—*R. Gunter.*

Epilepsy

1684. Bein, B. N. & Gurevich, V. L. (Sverdlovsk Psychoneurological Hosp., USSR) **Aktivizatsiya EEG u bol'nykh visochnykh épilepsiei metodom giperventilyatsii i nekotorye dannye o mekhanizme ee deistviya.** [EEG activation in temporal epileptics by means of hyperventilation and some data on the mechanism of its action.] *Zhurnal Nevropatologii i Psikhatrii*, 1970(May), Vol. 70(5), 698-702.—30 normal 18-30 yr. old Ss and 50 Ss suffering from temporal epilepsy participated in a study of the electrographic effect of hyperventilation. In 60% of the latter, epileptic activity in the cerebral biopotentials was elicited.

Recordings of EEG activation during hyperventilation were made before and after injection of aminazine (chlorpromazine) in order to block the ascending influences of the brainstem reticular formation. Hyperventilation following aminazine administration facilitated the appearance of epileptic discharges. The transformation of biopotentials in hyperventilation is attributed to developing hypoxia in the brain tissue. (English summary) (29 ref.)—*I. D. London.*

1685. **Bilkevich, T.** (Gdansk Medical Academy, Poland) **Psikhopatologiya visochnoi épilepsii.** [Psychopathology of temporal epilepsy.] *Zhurnal Nevropatologii i Psikhatrii*, 1970(Sep), Vol. 70(9), 1353-1356.—Describes the chief psychopathological signs of the temporal syndrome and the most characteristic features of the seizures occurring, given an epileptic focus in the temporal lobe. Determination of the extent and kind of mental disturbances is essential for proper diagnosis. The following are discussed: psychomotor and psychosensory attacks, endogenic paroxysmal changes in mood, and attacks of obsessional ideas, reminiscences, etc. (English summary)—*I. D. London.*

1686. **Bogolepov, N. K., Burd, G. S., & Fedin, A. I.** (2nd Moscow Medical Inst., USSR) **Épilepticheski status i ego lechenie v usloviyakh statsionara.** [Status epilepticus and its treatment under hospital conditions.] *Zhurnal Nevropatologii i Psikhatrii*, 1970(Dec), Vol. 70(12), 1761-1771.—Observed 180 cases (mostly between 20-59 yr. of age) of status epilepticus. Symptomatic epilepsy was present in 119 cases; in the remaining 61 cases it was not possible to establish an epileptic etiology. The importance of a battery of examinations for establishing the etiological and pathogenetic factors in status epilepticus is emphasized. 4 variants of the course of this disease were distinguished, differing with respect to frequency of attacks, depth of comatose state, and resistance to treatment. The effectiveness of the treatment of patients with grave status epilepticus in the neuroanatomical division of the hospital is indicated. Data on the EEG and electroencephalogram during seizure and in the interattack period are presented. The earlier intensive therapy is begun, utilizing different contemporary drugs and methods, the better the prognosis. (English summary)—*I. D. London.*

1687. **Boldyrev, A. I.** (Research Inst. of Psychiatry, Moscow, USSR) **Struktura pervykh pripadkov pri épilepsii u detei i vzroslykh.** [Structure of first seizures in child and adult epilepsy.] *Zhurnal Nevropatologii i Psikhatrii*, 1970(Jun), Vol. 70(6), 902-906.—100 children up to the age of 16 yr. and 300 16-40 yr. old adults with epilepsy of up to 3 yr. were observed in a comparative study of the characteristics of the 1st seizures in epileptics belonging to different age groups. In children small, visceromotor and psychomotor attacks, and nocturnal fears, sleep walking, abortive attacks, and tonic convulsions predominated. The predominance of these forms of attacks is attributed to the anatomic and functional dominance of the brainstem-diencephalic subcortical structure of the brain. In adults seizures connected with the primary cortical localization of the epileptic focus predominated: paroxysmal disorders of perception, thinking and speech, dreamy state, psychosensory attacks, etc. The clonic phase was dominant in the structure of the convulsive forms. Age-specific differences in seizures emerged with especial sharpness in children, thereby reflecting definite

stages in cerebral development. (English summary) (34 ref.)—*I. D. London.*

1688. **Corbella, T., Mamoli, A., & Rossi, L.** (Maggiore Hosp., Bergamo, Italy) **Motivi e ragioni che giustificano l'uso dell'ACTH nella terapia dell'epilessia.** [Reasons and results which justify the use of ACTH in the treatment of epilepsy.] *Rivista di Neurobiologia*, 1968(Apr), Vol. 14(2), 171-195.—ACTH and cortisone have unique effects on the brain. In various experiments with animals, these hormones lowered the convulsive threshold of the nervous cell. They were used to fight cerebral edema, and because of the favorable results, they were applied to epilepsy. The retention of sodium in the cell, the release of potassium, and the inactivity of the cellular membrane are at the base of convulsive attacks. ACTH modified the sum totality of these factors, thereby avoiding epileptic release. It dominates all types of epilepsy. 11 children (14 yr. and under) and 9 adults (17-46 yr.) were treated with ACTH. EEG findings show that in the course of the therapy, any type of paroxysmal activity diminished. ACTH modifies the water and electrolyte balance of the neuron cell membrane. (English summary) (22 ref.)—*A. M. Farfaglia.*

1689. **Dubikaitis, V. V.** (Polenov Research Neurosurgical Inst., Leningrad, USSR) **Dinamika polya potentsialov golovnogo mozga u zdorovogo cheloveka i bol'nogo s épilepticheskimi pripadkami tipa petit mal.** [Dynamics of the cerebral potential field in normals and epileptics with petit mal type of attacks.] *Zhurnal Nevropatologii i Psikhatrii*, 1970(Aug), Vol. 70(8), 1167-1171.—Presents a comparative EEG study of the dynamic characteristics of the cerebral potential field in normals and in those suffering from petit mal. The data show that in petit mal cases, the character of the dynamic picture of the EEG was distinct from that in normals. This distinction derived from the fact that, as pathological activity in the EEG grows, the trajectories of the excitatory field pass more often through planes which are close to the frontal plane of the brain, while during a petit mal attack they pass almost always through the frontal plane. Such a transformation of cerebral electrical activity not only is a specific expression of the pathological process, but is thought to play a definite role in the compensatory mechanism. (English summary)—*I. D. London.*

1690. **Kokina, E. A.** (Central Inst. for Advanced Medical Training, Moscow, USSR) **Klinicheskie osobennosti terapevticheskikh remisii pri épilepsii u detei i podrostkov v svyazi s zadachami sotsial'no-trudovoi adaptatsii.** [Clinical features of therapeutic remissions in epileptic children and adolescents in connection with the aims of social-work adaptation.] *Zhurnal Nevropatologii i Psikhatrii*, 1970(Oct), Vol. 70(10), 1541-1544.—Attempted to determine the factors leading to the onset of therapeutic remission (TR) in epilepsy. 102 1-16 yr. old hospitalized epileptics were observed from 1959-1961, followed by observations over an 8-10 yr. period as outpatients. The remissive clinical picture is described as it relates to the aims of "social-work adaptation." In 95 patients TR, lasting from 8-10 yr., occurred. 2 groups were discerned: (a) those with complete TR (absence of seizures for 7-8 yr. without supportive therapy), and (b) those with incomplete TR (considerably less frequency and the reduction of seizures with continuance of therapy). The degree of intellectual impairment is shown to have

special significance for "social-work readaptation." Criteria are listed for prognosis of the epileptic course in children and adolescents. (English summary)—*I. D. London.*

1691. **Leksin, E. N. & Osintseva, T. S.** (Izhevsk Medical Inst., USSR) **Znachenie likvorologicheskikh testov dlya differentsial'noi diagnostiki épilepsii travmaticheskogo i infektsionnogo geneza.** [Significance of cerebral spinal fluid tests for differential diagnosis of epilepsy of traumatic and infectious origin.] *Zhurnal Nevropatologii i Psikiatrii*, 1970(Aug), Vol. 70(8), 1155-1159.—Based on examinations of 235 epileptics, an attempt was made to develop cerebral spinal fluid (CSF) tests for the differential diagnosis of epilepsy in the residual period of closed brain injury and neuroinfections. Tests employed were pressure and composition of CSF, and permeability of the hemato-encephalic barrier for sugar and radioactive P^{32} . In the sequelae of closed brain injury and neuroinfections, evolving with epileptic attacks, the permeability of the hemato-encephalic barrier was usually moderately enhanced, and was not etiologically dependent. Some of the changes in composition and CSF pressure were due not so much to the major symptoms of the affection (epileptic attacks), as to its etiology; in conjunction with other symptoms these may be utilized in difficult cases of differential diagnosis of traumatic and infectious epilepsy. For epilepsy in the residual period of closed brain injury, reduction of CSF pressure and CSF chloride level was characteristic, along with increase in CSF sugar level and maintenance of normal blood sugar level. For epilepsy in the residual period of neuroinfections, increase in CSF pressure was characteristic, along with normal CSF protein, sugar, and chloride levels. (English summary) (19 ref.)—*I. D. London.*

1692. **Sal y Rosas, Federico.** **Indicios de la epilepsia en el Perú Antiguo.** [Incidence of epilepsy in ancient Peru.] *Revista de Neuro-Psiquiatria*, 1970(Mar), Vol. 33(1), 31-44.—Examines the history of Peruvian medical folklore to provide information on how epilepsy was regarded and treated in previous centuries. Epileptic attacks were originally called "heart disease" or "Sonko-Nanay" by the Incas. A survey of the nosographical and symptomatological history of Sonko-Nanay revealed an evolution in the attitudes toward the disease which parallels the development of human thought. Causes and origins, diagnoses, and treatments of Sonko-Nanay are considered in relation to the etiopathogenic fables, magic, and symbolic rites which they elicited in Peruvian history.—*P. Hertzberg.*

1693. **Strokina, T. I.** (Inst. of Experimental Medicine, Leningrad, USSR) **Elektroéntsefalograficheskii analiz vliyaniya nekotorykh neïtropnykh sredstv na mediatornye obrazovaniya golovnogo mozga u bol'nykh kozhevnikovskoi épilepsiei.** [Electroencephalographic analysis of the influence of some neurotropic drugs on the mediator structures of the brain in Kozhevnikov's epilepsy.] *Zhurnal Nevropatologii i Psikiatrii*, 1970(Nov), Vol. 70(11), 1671-1678.—40 Ss with Kozhevnikov's epilepsy (KE), resulting from tick-borne encephalitis, underwent EEG examinations. The role of the cerebral mediator systems (CMSs) was studied in the functioning of the epileptogenic focus, utilizing pharmacological agents, interacting with the adreno-, choline-, and serotoninreactive structures, in order to gauge their influence on the activity of the epileptogenic focus. The following agents were used: phenamine and

phenatin (adrenergics), aminazine (chlorpromazine; adrenolytic), galanthamine (cholinergic), amizyl (central M-cholinolytic), iprazid (serotonergic), and liseryl (serotoninolytic). EEG analysis of the state of the CMSs establishes their involvement in structuring the syndrome of KE. The character of the emerging disturbances of the CMSs is expressed by way of their dys-, hypo-, and hyperfunction. Application of the indicated agents to the structures of the CMSs, by stimulating or depressing their effect on the latter, facilitates (a) normalization of the functional state of the CMSs, and (b) alteration of the course of the convulsive reactions in KE. (English summary) (28 ref.)—*I. D. London.*

1694. **Utin, A. V.** (Samarkand Medical Inst., USSR) **Obmen medi i znachenie étoho mikroélémenta v patogeneze épilepsii.** [Copper metabolism and the significance of this microelement in the pathogenesis of epilepsy.] *Zhurnal Nevropatologii i Psikiatrii*, 1970(May), Vol. 70(5), 721-727.—Reports results of examinations of 101 12-54 yr. old epileptics (6 mo.-25 yr. duration of affection) and a normal control group of 68 in a study of the state of Cu metabolism in epilepsy as correlated with the severity of the course of this affection, the dynamics of its attacks, and the features characterizing it. Significant correlations are disclosed and detailed. It is suggested that in epilepsy a Cu deficit, particularly in nervous tissue, having arisen secondarily as a consequence of neurodynamic and biochemical changes, may exert a considerable influence on the future course of the epileptic process, e.g., aggravating it. (English summary) (42 ref.)—*I. D. London.*

1695. **Yurkova, I. A.** (Moscow Research Inst. of Psychiatry, Moscow, USSR) **Psikhopatologicheskie osobennosti épilepsii, voznikshoi u detei doskol'nogo vozrasta.** [Psychopathological features of epilepsy arising in children of preschool age.] *Zhurnal Nevropatologii i Psikiatrii*, 1970(Oct), Vol. 70(10), 1533-1537.—Presents results of observations of 72 3-5 yr. old epileptics with no symptoms of gross organic lesion of the CNS. 3 groupings were discerned: (a) distinct psychopathological symptoms expressed in the form of a "psychoorganic syndrome" and in emotional disturbances (42); (b) predominance of an organic psychosyndrome with symptoms of feeble-mindedness (10); and (c) no anamnestic indications of gross predisposing exogenic conditions (20), while hereditary factors appear more frequently (14 out of 20). The psychopathological symptoms, observed in the emotional volitional sphere and mental activity of preschool epileptics, were close to those observed in the same areas in adult epileptics. These symptoms are shown to be a function of stage of the pathological process, and the character and severity of the etiological factors involved. (English summary)—*I. D. London.*

1696. **Zappoli, R.** (U. Florence, Nervous & Mental Illness Clinic, Italy) **Influenza dell scariche parossistiche e delle lesioni epilettogene temporali su risposte riflesso-condizionate nell'uomo.** [Influence of temporal paroxysmal EEG discharges and epileptogenic lesions on conditioned responses in man.] *Rivista di Neurobiologia*, 1968(Apr), Vol. 14(2), 289-299.—Studied the capability to produce CR responses in a group of 21 Ss who had unilateral epileptogenic lesions from which frequent paroxysmal discharges originated. In some Ss it was difficult, even impossible, to obtain good CR responses using sounds as conditioning signals. Epileptic discharges of brief duration, e.g., .5-1 sec., had

word served as a warning signal, preceding the other, which was an imperative signal for button-pressing. The warning signal evoked a greater number of GSRs in the normals than the imperative one; this was reversed for the retardates. GSR adaptation to signal words occurred at the same rate and level for both groups; but in adaptation to the nonsignal words the retardates maintained a higher level of GSR frequencies than the normals. The attentional deficit model of retardation is not supported by the findings. (15 ref.)—*Journal abstract.*

1706. House, Betty J. (U. Connecticut) **A decremental effect of redundancy in discrimination learning.** *Journal of Experimental Child Psychology*, 1970(Dec), Vol. 10(3), 403-412.—Results from 12 children at a training school (MA range, 4-7 yr.; IQ range, 37-68) indicate that pattern discrimination problems are more difficult with 2 different patterns on each stimulus card (double stimulus) rather than the usual 1. Performance on double stimulus problems having a single relevant dimension (color or form) was impaired if the 2 patterns on each card differed along the relevant dimension. Within-card differences along an irrelevant dimension did not reliably depress performance. Support was found for the general principle that additional relevant cues facilitate learning if they are attributes of a single stimulus, but retard learning if they are spatially separated cues from the same relevant dimension. It is suggested that double stimuli divide attention or overload memory unless perceptually integrated.—*Journal abstract.*

1707. Husted, John R. (St. Louis U.) **The effectiveness of social versus concrete reinforcers on the performance of mentally retarded children.** *Dissertation Abstracts International*, 1970(Nov), Vol. 31(5-B), 2959.

1708. Lanzi, G., Aliprandi, M. T., & Ricotti de Paoli, M. P. (U. Pavia, Nervous & Mental Illness Clinic, Italy) **Il "test d'imitazione di gesti" di Bergès e Lézine in un gruppo di ragazzi oligofrenici.** [The "Gestures Imitation Test" of Bergès and Lézine on a group of oligophrenic children.] *Rivista di Neurobiologia*, 1968(Apr), Vol. 14(2), 210-223.—Measured the motor skills of a group of slow children and found the relationship between this and their intellectual development. The Bergès-Lézine Gestures Imitation Test was chosen to study the motor, spatial, and temporal functions. This is an imitation test consisting of a series of movements done by the examiner and repeated by the child. The 1st part consists of simple gestures performed with the hands and the arms; and the 2nd part consists of complex gestures performed with the fingers. To determine the intellectual level of the children, the WISC was chosen, because a more precise intellectual profile results from an analysis containing many different Ss. 53 6-11 yr. olds who attended the same school in the province of Pavia, were given the WISC and the Goodenough test. Their IQs ranged from 50-82. They were then given the Bergès and Lézine test, and there did exist a parallelism between intelligence and motor skills. The Gestures Imitation Test is also of clinical value, where it can be studied along with routine neurological tests. (English summary) (38 ref.)—*A. M. Farjaglia.*

1709. Moskowitz, Herbert & Lohmann, Werner. (California State Coll., Los Angeles) **Auditory threshold for evoking an orienting reflex in Mongoloid patients.** *Perceptual & Motor Skills*, 1970(Dec), Vol. 31(3), 879-882.—Obtained auditory intensity thresholds for

evoking an orienting reflex (OR) to a 1000-Hz tone from 15 male 18-35 yr. old Mongoloid retardates and 15 normal Ss. Mongoloids differed from normals both in the character of their OR and in requiring 30-40 db. greater intensity for evocation. Findings lend some support to the view that the apparent learning deficit is primarily a deficit in attention rather than in associative processes.—*Journal abstract.*

1710. Neeman, Renate L. & Phillips, Herbert E. (State U. New York, Buffalo) **Perceptual-motor survey of young adult mental retardates.** *Perceptual & Motor Skills*, 1970(Dec), Vol. 31(3), 1000.—Evaluated 36 mental retardates with the Purdue Perceptual-Motor Survey of E. G. Roach and N. C. Kephart. Correlations among test items occurred with greater frequency among Ss than in Roach and Kephart's normative population sample. It is suggested that this may reflect the high frequency of perceptual-motor dysfunction among retardates and might imply dysfunction syndromes as well as common constructs in different survey test items.—*Author abstract.*

1711. Ross, Dorothea. (Stanford U., Medical School) **The relationship between intentional learning, incidental learning, and type of reward in preschool, educable, mental retardates.** *Child Development*, 1970(Dec), Vol. 41(4), 1151-1158.—Studied the effect of type of reward (tangible, praise, and neutral comment) for intentional learning on the incidental learning of 36 young, educable, retarded children in social game situations in a Type II incidental learning paradigm. Modeling procedures were used to teach the intentional cues (rules of the game) and to demonstrate the incidental cues (player mannerisms). Results support an inverse relation between motivational level and incidental learning. Ss who were rewarded either tangibly or with praise learned more of the intentional and less of the incidental cues than Ss who were exposed to neutral comments.—*Journal abstract.*

1712. Wilcox, Stephen J. & Baumeister, Alfred A. (U. Alabama) **Transfer of verbal paired associates in mentally retarded individuals and normal children as a function of interlist similarity.** *Journal of Experimental Child Psychology*, 1970(Dec), Vol. 10(3), 277-286.—Utilized verbal paired-associates (PA) tasks to determine the specific effects of transfer for 60 4th-6th grade normal children and 60 retardates matched on MA. The degree of item similarity between original and transfer learning was varied. Performance of the children conformed to that previously observed with normal children. The retardates showed marked departure with respect to the C-B and A-B conditions of PA interlist similarity. A stage analysis was used to separate the response learning and associative hook-up phases of PA learning. Results suggest the importance of the response phase in predicting differences between normal and retardate performances in some aspects of PA transfer learning. The relatively great negative transfer displayed by the retardates under the A-B condition is attributable to associative interference. (19 ref.)—*Journal abstract.*

1713. Wright, Jack; Clayton, Jean, & Edgar, Clara L. (1st United Methodist Church, Burbank, Calif.) **Behavior modification with low-level mental retardates.** *Psychological Record*, 1970(Fal), Vol. 20(4), 465-471.—Trained ward technicians in a state residential institution to reinforce a set of positive behaviors with social reinforcers (verbal and physical attention) and to extinguish selected negative behaviors (by not attending

to them) in 15 severely retarded children. Changes were statistically significant with improvement on 11 of the positive behaviors and 12 of the negative behaviors. The training value to the technicians for general ward programs is noted.—*Journal abstract.*

Training & Vocational Rehabilitation

1714. Dybwad, Gunnar. (Brandeis U.) **Planning facilities for severely and profoundly retarded adults.** *Hospital & Community Psychiatry*, 1968(Dec), Vol. 19(12), 392-395.—Describes the features desirable in facilities to be used for housing severely retarded adult patients. The report was occasioned by a plan to build small cottage units to replace 2 of the oldest buildings of a state school for the retarded.

1715. Song, R. H. & Song, A. Y. (Wisconsin State U., Whitewater) **Development of a vocational adjustment rating scale for the retarded.** *Journal of Counseling Psychology*, 1971(Mar), Vol. 18(2), 173-176.—Examines a pilot study which developed a vocational adjustment rating scale for the retarded using 113 15-44 yr. old mental retardates as Ss. It was hypothesized that retardates classified as better workers can be significantly different from those classified as poor workers in the scale ratings provided by their supervisors. The scale, composed of 52 brief items, showed high reliability and concurrent validity. Results support the hypothesis and warrant further research toward standardization of the scale.—*Journal abstract.*

PHYSICAL ILLNESS

1716. ———. **Placebo effects.** *British Medical Journal*, 1970(May), Vol. 2(5707), 437.—A study by Dr. Kurt Schapira and his colleagues shows that the response of patients to tablets of different colors is apt to vary. Patients with anxiety symptoms showed a more favorable response to green tablets, while the same preparation in a yellow tablet was more effective in relieving depression. While one report has suggested that 1/3 of Health Service prescriptions fall into the placebo category, there is little evidence to suggest that placebos are being employed in a systematic way. With both active and inert preparations symptomatic improvement varies considerably according to the expectation of patient and therapist. On many occasions an appropriately presented placebo will be less harmful and perhaps more beneficial than a complex and incompletely understood drug.—*S. R. Diamond.*

1717. Castles, Mary M. (St. Louis U.) **The behavior of the dying patient: Taxonomy and correlates.** *Dissertation Abstracts International*, 1970(Nov), Vol. 31(5-B), 2775.

1718. Hackett, Thomas P. & Cassem, N. H. **Psychological reactions to life-threatening illness: Acute myocardial infarction.** In H. S. Abram (Ed.), "Psychological aspects of stress." (See PA, Vol. 46: Issue 1) 29-43.

1719. Hagen, Richard L. (U. Illinois, Urbana-Champaign) **Group therapy versus biblio-therapy in weight reduction.** *Dissertation Abstracts International*, 1970(Nov), Vol. 31(5-B), 2985-2986.

1720. McDaniel, James W. (U. Colorado, Medical School, Denver) **Cognitive dysfunction with cardiovascular disease.** *Psychosomatic Science*, 1970(Sep), Vol. 20(5), 280-281. Recent investigations have suggested

that cerebral hypoxia due to cardiac insufficiency may produce cognitive impairment. Experimental evidence confirming cognitive dysfunction in persons having cardiovascular disease has, however, not been thoroughly developed. Cognitive and visual-motor impairment with cardiovascular disease in 20 men (mean age of 48.4 yr.), was confirmed in the present study; this is apparently related neither to aging nor to hypertension.—*Journal abstract.*

1721. Meynen, Grace E. (Illinois Inst. of Technology) **A comparative study of three treatment approaches with the obese: Relaxation, covert sensitization and modified systematic desensitization.** *Dissertation Abstracts International*, 1970(Nov), Vol. 31(5-B), 2998.

1722. Murphy, F., Srivastava, P. C., Varadi, S., & Elwis, A. (Northern General Hosp., Sheffield, England) **Screening of psychiatric patients for hypovitaminosis B₁₂.** *British Medical Journal*, 1969(Sep), Vol. 3(5670), 559-560.—Performed vitamin B₁₂ assays and inspection of peripheral blood films on 1004 consecutive new patients over 50 yr. old admitted to a mental hospital. The serum levels of vitamin B₁₂ were assayed by either the microbiological method, or an isotopic method. Peripheral films were examined for the presence of hypersegmentation of the neutrophils and macrocytosis. Results led to the discovery of pernicious anemia in only 2 cases. It is concluded that routine vitamin B₁₂ assays are justified only when fully automated techniques are available. (17 ref.)—*Journal abstract.*

1724. Weiss, Jonathan H., Martin, Charlan, & Riley, Jodi. (Children's Asthma Research Inst., Denver, Colo.) **Effects of suggestion on respiration in asthmatic children.** *Psychosomatic Medicine*, 1970(Jul), Vol. 32(4), 409-415.—16 chronic severe asthmatic children were told that they would be given a bronchial challenge test using a substance to which they were allergic whereas they really inhaled physiologic saline, in an attempt to replicate the findings of Luparello et al. on the effects of suggestion on airway reactivity. Of the 16 Ss, 1 responded with decreased flow rate and wheezing in the suggestion session. In a control session involving saline and no suggestion, the same response occurred. The other Ss failed to show any consistent response on any of the objective measures, although a number had subjective sensations of tightness.—*W. G. Shipman.*

COMMUNITY SERVICES

1725. Gottesfeld, Harry. (Roosevelt Hosp., Research & Evaluation, New York, N.Y.) **An information system for assessing community mental health projects.** *Hospital & Community Psychiatry*, 1971(Jan), Vol. 22(1), 14-16. As more complex data requiring more complicated statistical analysis was required, an information system was developed. Information was gathered on 189 project variables using IBM cards that could be programed and analyzed by a computer. When variables to be studied were not so numerous, the Keysort system was found to be most useful. Each variable is coded with a 1-, 2-, or 3-digit number, and intercorrelations are computed, resulting in more than 17,000 correlations. The result of the more sophisticated coding system was

that the number of staff projects and time spent on such projects increased markedly.—R. Sivley.

1726. Grunebaum, Henry. (Ed.) (Harvard Medical School, Boston, Mass.) **The practice of community mental health.** Boston, Mass.: Little, Brown, 1970. xv, 837 p. \$15.

1727. Hammerschlag, Carl A., Parnes, Phyllis, & Tischler, Gary. (Div. of Indian Health, Phoenix, Ariz.) **A community-centered program for heroin addicts.** *Hospital & Community Psychiatry*, 1971(Jan), Vol. 22(1), 16-18.—A mental health center program for heroin addicts, begun in October 1968, provided detoxification, use of methadone, and psychotherapy. Because of limited staff and beds, only 1 addict was treated at a time, and length of stay was 7-10 days. After concluding that the program was not successful, alterations in the program were made. The new program, in which rate of success has been markedly higher included increasing the length of inpatient treatment from 1-4 wk. and treating 4 addicts on the ward at one time. The addicts as a group took part in ward activities with other patients and received special group therapy as well as individual therapy while they were still on the ward. A review of the program reports marked gains for the revised methods.—R. Sivley.

1728. House, Joseph W. (Veterans Administration Hosp., Mental Hygiene Clinic, Buffalo, N.Y.) **Using volunteers in a day treatment program.** *Hospital & Community Psychiatry*, 1968(Dec), Vol. 19(12), 391.

1729. Ingham, Ruth E. & Allgeyer, Jean M. (Los Angeles Psychiatric Service, Calif.) **Early access to clinic treatment.** *Hospital & Community Psychiatry*, 1968(Dec), Vol. 19(2), 387-388.

1730. Schulberg, Herbert C. & Wojcik, Susan C. (Harvard Medical School, Boston, Mass.) **A reanalysis of treatment at a changing mental hospital.** *Hospital & Community Psychiatry*, 1971(Jan), Vol. 22(1), 19-23.—Studied the manner in which Boston State Hospital has evolved since 1965 from a large traditional public mental hospital into a community mental health center for its large urban area. Percentage of inpatients receiving various types of therapies was computed for the hospital population as a whole, for patients in various hospital units, and for patients at various age levels. For somatic therapy, for the hospital population as a whole, the increase was from 45-80%. For verbal therapy the increase was from 18-30%, but for activity therapy there was a decrease from 31-22%. The period of time studied was from 1963-1968. A central finding was reported to be that the increased administration of drugs to long-term patients is the single most significant factor in reducing the proportion of the hospital population receiving no specific therapy.—R. Sivley.

1731. Wilson, Wayne M. (Mendocino State Hosp., Alcoholism & Drug Abuse Services, Talmage, Calif.) **Hospitalized drug addicts aid public education.** *Hospital & Community Psychiatry*, 1968(Dec), Vol. 19(12), 379.—Describes a project of a state hospital drug-abuse program aimed at prevention and intervention through community education. Hospitalized patient addicts presented panel discussions on drug abuse to school groups and, in this way, helped to create new communication between students, parents, and teachers.

GERIATRICS

1732. Grewel, F. & Greene, M. C. (U. Amsterdam, Orthopedagogical Inst., Netherlands) **Diagnosis and**

treatment of speaking and language disorders following cerebral injury in old age. *Psychiatria, Neurologia, Neurochirurgia*, 1968(Nov), Vol. 71(6), 469-482.—Discusses the treatment of disorders of speaking, deterioration of the urge to speak, and disorders in the use of language in senile and presenile patients with cerebral deterioration. Speech therapy and its use in the rehabilitation of geriatric cases are discussed.

1733. Morozova, T. V. (USSR Academy of Medical Sciences. Inst. of Psychiatry, Moscow) **Korrelyatsionnyi analiz chastoty α -ritma v EEG zdorovykh pozhilykh lyudei bol'nykh psikhozami pozdnego vozrasta.** [Correlational analysis of α -rhythm frequency in the EEG of normal aging people and those with the psychoses of old age.] *Zhurnal Nevropatologii i Psikhatrii*, 1970(Nov), Vol. 70(11), 1667-1671.—Presents a comparative study of α -rhythm frequency (α -RF) in the EEG of 85 normals and 98 psychotics (both groups over 60 yr. old). Among the latter were 62 schizophrenics with a predominance of the paranoid continuous-progressive form of the psychosis and a clinical state characterized as hallucinatory-delusional. The remaining 36 represented cases of psychoses connected with vascular diseases of the brain (chiefly cerebral atherosclerosis). The latter bear an endoform character reminiscent of the hallucinatory-paranoid symptoms of late schizophrenia. A regular decrease in α -RF occurred with increase of age in the elderly. No difference was detected in average α -RF between the normal elderly and aging schizophrenics (regardless of whether the onset of the psychosis was early or late). No reliable r was found between α -RF and duration of the psychosis. In the vascular psychoses, average α -RF was lower than in normals of corresponding age. In these psychoses a negative r is established between age and duration of the psychosis, as well as α -RF. (English summary) (22 ref.) J. D. London.

1734. Wolff, Kurt. (Veterans Administration Hosp., Coatesville, Pa.) **Rehabilitating geriatric patients.** *Hospital & Community Psychiatry*, 1971(Jan), Vol. 22(1), 8-11.—The most important aspects of rehabilitating the elderly are conveying hope, reestablishing confidence, and overcoming an undue fear of death. The psychiatrist must be aware of the attitudes of elderly patients about death and dying and must handle those issues with special care and circumspection. An elderly person must have something to work for, live for, and hope for somebody or something.—R. Sivley.

EDUCATIONAL PSYCHOLOGY

1735. Allon, Nancy R. **Systems of classroom interaction analysis: A discussion of structural limitations.** *Journal of Experimental Education*, 1969(Win), Vol. 38(2), 1-3.—The attempt to improve the quality of classroom instruction has spawned numerous systems of classroom behavior analysis. Each system which provides an analysis of classroom interaction between students and classroom teacher is structurally inadequate because it defines topographically similar behaviors as a single behavior, and describes these behaviors under a variety of conditions and often with different experimental Ss. These systems are of no functional value as instruments of classroom behavior analysis. They must be refined or defined again so that they are capable of specifying the rate of occurrence and

the conditions under which a single behavioral response occurs.—*Journal abstract.*

1736. Henderson, Ronald W. (U. Arizona) **Research and consultation in the natural environment.** *Psychology in the Schools*, 1970, Vol. 7(4), 335-341.—Summarizes some of the research conducted to identify environmental variables that are related to intellectual performance. It describes an environmental intervention program designed to manipulate these variables. This program is a component of the system of training and services that comprise the Tucson Early Education Model. (16 ref.)—H. Kaczowski.

1737. Lappin, Robert W. (St. Louis U.) **Meaningfulness, deviant achievers and personal adjustment.** *Dissertation Abstracts International*, 1970(Nov), Vol. 31(5-B), 2993-2994.

1738. MacKenzie, Norman; Eraut, Michael, & Jones, Hywel C. **Teaching and learning: An introduction to new methods and resources in higher education.** Paris, France: Unesco and the International Assn. of Universities, 1970. 209 p. \$3.50 (paper).

1739. Portal-Foster, C. W. (Canadian Welfare Council, Ottawa, Ontario) **An application of work-emotionality theory to adult education.** *Adult Education*, 1970(Win), Vol. 20(2), 67-87.—Examined the applicability of W. R. Bion's work-emotionality theory to the empirical study of adult instructional groups. The study was designed (a) to determine the nature of the relationships existing between and among the several qualities of emotion and types or levels of work orientation, and (b) to discern relationships and/or patterns of behavior which could be tested under laboratory conditions. 16 nursery school teachers met for 8 sessions of 2 hr. each. A Q-sort was administered at the initial session to determine preferences for an ideal group culture, and during the last session to ascertain perceptions of the culture experienced. Transcripts of the group interaction were evaluated. Analysis of a representative subgroup supports the practical framework of the work-emotionality theory. However, it is noted that Ss with an orientation toward I type of interaction may interact differently under group pressures. Changes in interaction patterns may be induced without the knowledge of members or it may be a voluntary act of members. (25 ref.)—*Journal abstract.*

1740. Rappel, Dorothy. (Catholic U. of America) **Teacher-pupil interaction at the elementary grade level and pupil creativity.** *Dissertation Abstracts International*, 1970(Nov), Vol. 31(5-B), 2965.

1741. Rowland, G. Thomas & Frost, Joe L. (New York U.) **Motivation: A structure-process interpretation.** *Psychology in the Schools*, 1970, Vol. 7(4), 375-383.—Presents the theoretical position for the structure process model for educational encounters. Demonstrates how a blend of hedonism, homeostasis, and drive theory can have functional value in an educational setting. (33 ref.)—H. Kaczowski.

1742. Sattler, Howard E. & Swoope, Karen S. (Arizona State U.) **Token systems: A procedural guide.** *Psychology in the Schools*, 1970, Vol. 7(4), 383-386.—Presents and discusses 10 procedural guidelines for implementing a token system in an educational setting.—H. Kaczowski.

1743. Stallings, William M., Wolff, Joseph L., & Machr, Martin L. (U. Illinois) **Fear of failure and the pass-fail grading option.** *Journal of Experimental Education*, 1969(Win), Vol. 38(2), 87-91.—Compared 76

students enrolled for pass-fail (P-F) credit on test anxiety, grade utilities under chance and skill conditions, grades, and course loads with 83 taking course work under an A-F grading system. Only partial confirmation was found for a prediction that test anxiety should be negatively correlated with the difference between grade utilities under chance and under skill conditions. Other findings were that test anxiety and grade option were not significantly correlated, and that the P-F sample had significantly higher grades and heavier course loads.—*Journal abstract.*

1751. Cadiz Menne, Joy M. & Sinnett, E. Robert. (Kansas State U., Counseling Center) **Proximity and social interaction in residence halls.** *Journal of College Student Personnel*, 1971(Jan), Vol. 12(1), 26-31. Investigated the relationship of physical proximity to friendship and helping choices among 63 university students (32 male, 31 female) in 2 high-rise residence halls through the use of a sociometric questionnaire. The questionnaire was completed on 2 occasions, 6 wk. apart. It was hypothesized that the proximity of rooms is positively related to friendship and helping choices received. The measures of friendship and helping choices were reliable. Mutual choices or rejections were found to be a more meaningful social indicator than unreciprocated choices. "For reciprocated choices the proximity relationship holds, but for both number of helping and number of friendship choices received, there is no support for the proximity hypothesis."—R. H. Mueller.

1752. Chupikulchai, Sobha G. (U. Northern Colorado). **A descriptive analysis of the adjustment and socialization problems for Thai students attending colleges and universities in the Rocky Mountain states.** *Dissertation Abstracts International*, 1970(Nov), Vol. 31(5-B), 2953-2954.

1753. Ciccati, Samuel M. (United States International U., San Diego, Calif.) **Comparison of three methods of facilitating encounter groups in a college environment.** *Dissertation Abstracts International*, 1970(Nov), Vol. 31(5-B), 2954-2955.

1754. Damm, Vernon J. (U. Portland, School of Nursing) **Creativity and intelligence: Research implications for equal emphasis in high school.** *Exceptional Children*, 1970(Apr), Vol. 36(8), 565-569.

Examined the possible relationships among creativity, intelligence, and self-actualization in 208 high school students to determine whether or not consistent self-actualization scores existed for Ss high in the 1st 2 variables. Ss high in both creativity and intelligence had significantly higher scores in self-actualization than those obtained by Ss high in either creativity or intelligence. No significant difference in self-actualization was found between Ss high in creativity only and those high in intelligence only. Results indicate that educational systems should stress both intellectual and creative abilities to achieve the highest level of psychological well-being in students. (24 ref.)—*Journal abstract.*

1755. do Carmo de Avila, M. & Gillet, L. **Etude de l'attitude et de l'aptitude envers les mathématiques.** [Study of attitude to and aptitude for mathematics.] *Bulletin de Psychologie Scolaire et d'Orientation*, 1970(Jun), Vol. 19(2), 79-87.—Applied an attitude scale and aptitude test to 42 men and 120 girls in connection with entrance examinations at the Department of Philosophy, Science, and Literature of the University of Ribeirão Preto, Brazil. The scale was composed of items favorable and unfavorable to mathematics, and the aptitude test consisted of mathematical exercises borrowed from a statistical course. It is shown that the influence of the attitude (toward the teacher of the course, the textbooks, etc.) and the aptitude, respectively, shown in the scholarly results obtained in mathematics, are both highly significant and equally important, concerning success or failure. (English summary).—P. von Toul.

1756. Feather, N. T. (Flinders U. of South Australia, Bedford Park) **Value systems in state and church schools.** *Australian Journal of Psychology*, 1970(Dec),

Vol. 22(3), 299-313. Administered Rokeach's Value Survey to 283 senior boys from 2 secondary schools (state and church) and 114 ministers. Within each school 1 group of boys ranked their own values, the other group ranked the school values. The ministers ranked the values in terms of Christian education. There were differences between the schools in the relative importance assigned to particular values and differences within each school between own values and school values. Both schools were seen as emphasizing values involving achievement, control, and maturity more than the students did themselves, but the students placed more emphasis on values concerned with affiliative relationships, an absence of conflict and ill-feeling, and a flexible, adventurous, and self-reliant stance towards the world. The ministers ranked religious values as high and materialist values as low. There were marked similarities in average value systems between students in relation both to their rankings of own values and their rankings of school values.—*Journal abstract.*

1757. Hannah, William. (Project on Student Development in Small Colleges, Plainfield, Vt.) **Personality differentials between lower division dropouts and stay-ins.** *Journal of College Student Personnel*, 1971(Jan), Vol. 12(1), 16-19.—The Omnibus Personality Inventory (OPI) was administered to 2874 freshmen students at 13 colleges. Aptitude scores were also collected from the existing college records of these students. It was found that students who remain in college as compared with those who drop out differ on 6 of the 14 scales of the OPI. It appears that dropouts are more complex, more impulsive, more anxious, less personally integrated, less altruistic, and less willing to exert an effort to make a good impression on either their peers or their teachers. Significant differences were obtained on 6 scales between male persisters and male dropouts, while significant differences were found on 7 scales between female persisters and female dropouts. Also, differences in aptitude were found to be related to dropping out. These findings are consistent with previous research in this area.—R. H. Mueller.

1758. Harris, Theodore L., Kiefert, James J., & Darby, Merlin D. (U. Puget Sound) **Attitudes expressed by students toward a beginning course in educational psychology.** *Journal of Educational Research*, 1969(Apr), Vol. 62(8), 344-350. Developed a 21-item attitude inventory from representative statements made by 377 undergraduates concerning their expressed attitudes toward a beginning course in educational psychology in order to examine the stability of their attitudes between the midpoint and the end of the course. A t-test analysis of results revealed positive change toward the course from pre- ($n=340$) to posttest ($n=318$) for 16 items at or beyond the .05 level of significance. Of these 16 items, 14 were at or beyond the .01 level and 13 were at or beyond the .001 level. The rationale and procedures used in the latter 2 of the course which appeared to influence such changes are described, and 5 implications for the teaching of beginning courses in educational psychology are suggested.—*Journal abstract.*

1759. Healy, Charles C. (U. California, Los Angeles) **Reducing error variance attributable to social desirability.** *Journal of Counseling Psychology*, 1971(Mar), Vol. 18(2), 132-137. Tested the hypothesis that instructing the S about social desirability and asking him to avoid it would increase the validity of self-ratings by determining whether Ss who rated themselves for

guidance (assumed not to be influenced by social desirability) would rate themselves differently from Ss who rated themselves for science (expected to be influenced by social desirability). $\frac{1}{2}$ of each group received social desirability instruction and $\frac{1}{2}$ did not. Differences among the ratings of 87 male undergraduates suggest that instruction improved validity; differences among the ratings of 83 females did not permit rejection of the null hypothesis. (17 ref.)—*Journal abstract*.

1760. Heist, Paul. (U. California, Berkeley) **Activist students challenge the social scientists.** In F. F. Korten, S. W. Cook, & J. I. Lacey (Eds.), "Psychology and the problems of society." (See PA, Vol. 46:Issue 1) 395-405.

1761. O'Leary, K. Daniel; Kaufman, Kenneth F., Kass, Ruth E., & Drabman, Ronald S. (State U. New York, Stony Brook) **The effects of loud and soft reprimands on behavior of disruptive students.** *Exceptional Children*, 1970(Oct), Vol. 37(2), 145-155.—Selected 2 children in each of 5 2nd and 3rd grade classes for a 4-mo study because of their high rates of disruptive behavior. During a base-line condition the frequency of disruptive behaviors and teacher reprimands was assessed. Almost all teacher reprimands were found to be of a loud nature and could be heard by many other children in the class. During the 2nd phase of the study, teachers were asked to use primarily soft reprimands which were audible only to the S being reprimanded. With the institution of the soft reprimands, the frequency of disruptive behavior declined in most of the Ss. Then the teachers were asked to return to the loud reprimand and a consequent increase in disruptive behavior was observed. Finally, the teachers again used soft reprimands, and again disruptive behavior declined.—*Journal abstract*.

1762. Peterson, Richard E. (Educational Testing Service, Berkeley, Calif.) **The student protest movement: Some facts, interpretations, and a plea.** In F. F. Korten, S. W. Cook, & J. I. Lacey (Eds.), "Psychology and the problems of society." (See PA, Vol. 46:Issue 1) 388-394.

TESTING

1768. Bennett, George K. (Psychological Corp., New York, N.Y.) **Response to Robert Williams.** *Counseling Psychologist*, 1970, Vol. 2(2), 88-89.—Essentially a vindication against the charge lodged by R. L. Williams (see PA, Vol. 45:4932) that conventional psychological tests, e.g., Stanford Binet, Wechsler, Scholastic Aptitude Test, Stanford Achievement, Iowa Test of Basic Skills, Graduate Record Examination, and Miller's Analogies Test, "are unfair and improperly classify Black children." Bennett offers the following defense: (a) the educational deficit suffered by the culturally deprived is revealed by these tests; (b) the tests measure the ability to perform tasks or display acquired knowledge, but do not measure intelligence; (c) no test is designed to discriminate against sex, religion, or race; and (d) tests attempt to elicit the best performance of the testee. To reduce anxiety, the following are provided: tape-recorded familiarization program, "culture-laden" verbal and numerical measures, and "CAST" equipment, i.e., 3 tape-cartridges containing well-paced, clearly given test instructions.—*W. S. Sahakian*.

1769. Boren, John J. & Brady, Joseph V. (American U.) **A student self-grading technique for increasing the didactic value of the classroom exam.** *Psychological Record*, 1970(Fal), Vol. 20(4), 443-444.—Describes a technique which permits students to grade their own exams immediately after the exam is completed. The technique prevents cheating, allows rapid confirmation of correct answers (relative to conventional grading practices), and saves the instructor considerable work.—*Journal abstract*.

1770. Clemans, W. V. (Science Research Assoc., Chicago, Ill.) **A note in response to a request by the Editor to comment on R. L. Williams' article entitled "Black pride, academic relevance, and individual achievement."** *Counseling Psychologist*, 1970, Vol. 2(2), Vol. 45:4932 article, Clemans agrees that blacks do not have inferior intelligence, nor are test scores absolute. Differences between immediate and long-term potential are the sources of confusion. Testing a Frenchman to translate English, when he knows no English would result in a 0 rating for his English intelligence, and it would be unthinkable to require that the test be 1st translated into French, but not when the long-term potential is under consideration. The same holds for whether or not a non-English-speaking student should be admitted to an American medical school. "No perfect measuring instrument is available to identify those with undeveloped but good long-term potential." Distinctions should be made between ability and achievement.—*W. S. Sahakian*.

1771. Hansen, Richard A. (Columbia U.) **The influence of variables other than knowledge on probabilistic tests.** *Dissertation Abstracts International*, 1970(Oct), Vol. 31(4-B), 2254-2255.

1772. Kooker, E. W. (North Texas State U.) **The relationship between performance in a graduate course in statistics and the Miller Analogies Test and the Watson-Glaser Critical Thinking Appraisal.** *Journal of Psychology*, 1971(Mar), Vol. 77(2), 165-169.—Correlated examination scores in a graduate course in statistics with scores on the Miller Analogies Test (MAT) and the Watson-Glaser Critical Thinking Appraisal. 69 graduate students served as Ss. Since not all Ss had had their application to the doctoral program acted upon, it was anticipated that there would be greater than usual variability on the MAT. However, even with a somewhat larger semantic differential, a nonsignificant r (.21) between the MAT and test scores was obtained. The r between the Watson-Glaser and test scores was significant (.37), $p = .01$.—*Author abstract.*

1773. Logiudice, Joseph F. (St. John's U.) **The relationship of self-esteem, test anxiety and sixth grade students' arithmetical problem solving efficiency under variant test instructions.** *Dissertation Abstracts International*, 1970(Nov), Vol. 31(5-B), 2995-2996.

1774. Messick, Samuel & Anderson, Scarvia. (Educational Testing Service, Princeton, N.J.) **Educational testing, individual development, and social responsibility.** *Counseling Psychologist*, 1970, Vol. 2(2), 80-88.—Argues that responsible standards exist for the adequate evaluation of tests for their specific uses, yet occasionally these standards are not applied. Considered are the issues of bias and validity, the social consequences of testing, in addition to the expansion of the meaning of tests to engulf "assessment." The sources of poorer performance by disadvantaged children may be attributable to: (a) the test's measuring different things for different groups, (b) the test's entailment in irrelevant difficulty (items may be more germane to one group than another, testing conditions creating an anxious or alienated condition, and individuals differing in their test-taking strategies or "test wiseness"), and (c) the test's accurate reflection of ability or achievement levels. Fairness must be exercised in test applications as well as an appropriate proposed purpose of the selected test. (20 ref.).—*W. S. Sahakian.*

1775. Munday, Leo A. (American College Testing Program, Iowa City, Ia.) **Measurement for equal opportunity.** *Counseling Psychologist*, 1970, Vol. 2(2), 93-97.—Unless tests aid the student, providing the college with differential student guidance and instruction, they are inadequate. Measures should provide the college with guidelines determining the instruction most beneficial, interesting, and instructive to the student. Verbal talent has been overemphasized to the exclusion of other types of talent. A test should indicate not how a student would fare under the present educational system, but what type of instruction he should have. An educator ought to address his tests and attention to the student's educational development and the solution of human problems. Traditional testing must give way to tests that are relevant to members of the American culture as a whole and not a selected segment for an all-too-limited purpose. Diverse kinds of data should be considered. (20 ref.).—*W. S. Sahakian.*

1776. Osipow, Samuel H. & Kreinbring, Inese. (Ohio State U.) **Temporal stability of an inventory to measure test anxiety.** *Journal of Counseling Psychology*, 1971(Mar), Vol. 18(2), 152-154.—Tested 97 undergraduates on a modification of an anxiety scale based

on the Alpert and Haber Anxiety Test and the Sarason Test Anxiety Scale during the 1st wk. of the academic quarter and retested them in subgroups at intervals of 5, 6, 7, 8, and 9 wk. The test anxiety instrument was stable over that time on both emotionality and cognitive worry scales despite situational differences in anxiety-provoking events. This suggests the potential usefulness of the instrument as a criterion to measure effects of treatments designed to reduce test anxiety.—*Journal abstract.*

1777. Peters, Donald L. & Messier, Victor. (Pennsylvania State U.) **The effects of question sequence upon objective test performance.** *Alberta Journal of Educational Research*, 1970(Dec), Vol. 16(4), 253-265.—Administered a 76-item 4-alternative multiple-choice test to 41 graduate students in a basic research course. In addition, an internal-external scale, an achievement anxiety scale, a dogmatism scale, and an ambiguity scale were also administered. 3 quizzes and a final examination were given in 1 of 2 ways: sequential ordering of the material as it was presented in class, or random ordering. Although there were no significant differences between the 2 orderings, Ss who took the sequential form 1st performed significantly more poorly on the random form. A highly significant interaction revealed that those scoring high on debilitating anxiety performed less well on the random order than on the sequential order. Ss performing low on the pretest, scored higher on a subsequent sequential than on a random format.—*N. M. Chansky.*

1778. Ramsey, Phillip H. & Vane, Julia R. (Hofstra U.) **A factor analytic study of the Stanford Binet with young children.** *Journal of School Psychology*, 1970, Vol. 8(4), 278-284.—Found 7 factors as the result of a factor analysis of Year IV-6 Year VI of the 1960 Revision of the Stanford Binet Intelligence Test. No factor had a sufficient number of high loadings to justify interpretation as "g," a general intelligence factor. The test protocols used were of 152 children from 3 7 yr. old who attended a university nursery school or Head Start day care centers. The group included 107 white and 45 Negro children who had been tested as part of a routine intellectual evaluation. The socioeconomic level, as measured by occupation of the parent, was higher than that of the standardizing population of the Binet, as was the mean IQ (109.4 ± 14.7). Results are compared with the logical analysis of M. M. Meeker and M. Bonsall based upon J. P. Guilford's factors of the intellect, and with R. E. Valett's profile analysis.—*Journal abstract.*

1779. Sommer, John. **Response to Robert Williams.** *Counseling Psychologist*, 1970, Vol. 2(2), 92.—Sommer asserts that R. L. Williams' (see PA. Vol. 45:4932) article does not point to racism in tests, and agrees in substance with Williams' comment on the improper use of tests. It is suggested that tests are tools, and that there should be better education for the tool users, rather than the elimination of the tools.—*W. S. Sahakian.*

1780. Thorpe, Joanne & West, Charlotte. (Southern Illinois U.) **Estimation of validity for a test of game sense.** *Perceptual & Motor Skills*, 1970(Dec), Vol. 31(3), 933-934.—Ranked 73 female undergraduates on skill by means of a ladder tournament in badminton. Regression analyses indicate the game sense test score was not effective in predicting rank on the ladder tournament. Intercorrelations of the 10 subtests of the game sense test ranged from $-.01$ to $.67$ but were generally nonsignificant. It is concluded that the game sense test is invalid by the approach utilized.—*Journal abstract.*

SPECIAL EDUCATION

1781. Benton, Arthur L. (U. Iowa) **Language learning: Perceptual bases.** *Proceedings of the Annual Reading Institute*, 1968(Mar), Vol. 7, 23-31.—Considers the nature, functions, and early development of language. Language consists of the use of symbols for purposes of communication. When language is defective, thinking is not totally destroyed, but it is hampered. Language arises and develops on the basis of audition. Knowledge of the perceptual bases of language learning is derived for the most part from the study of the rather cruel "experiments of nature" provided by the occurrence of organic diseases and sensory deficit in children. The evidence furnished by investigations of language development in children suffering from congenital deafness and from deficiencies in vision is reviewed. The condition known as specific reading disability is discussed. Since there is no basic understanding of the factors causing it, it is not possible to undertake truly rational treatment of the disability.—S. Diamond.

1782. Forness, Steven R. & MacMillan, Donald L. (U. California, Mental Retardation Center, Los Angeles) **The origins of behavior modification with exceptional children.** *Exceptional Children*, 1970(Oct), Vol. 37(2), 93-100.—Attempts to put present day behavior modification programs in historical perspective. The formal beginnings of the movement are noted in the 1st quarter of this century, but its origins and techniques are traced to much earlier periods, e.g., Greco-Roman practices, and the work of J. Itard and E. Seguin in the 19th century. The efforts of several behavior modification practitioners in and peripheral to the field of special education are described from 1920-1967. (44 ref.)—*Journal abstract*.

1783. Gonzalez, Ann H. (U. Houston) **Academic achievement and progress status associated factors in minimally brain injured children.** *Dissertation Abstracts International*, 1970(Nov), Vol. 31(5-B), 2984-2985.

1784. Lovitt, Thomas. (U. Washington, Coll. of Education) **Behavior modification: The current scene.** *Exceptional Children*, 1970(Oct), Vol. 37(2), 85-91.—Defines current concepts of behavior modification as (a) a decelerating tactic for undesired behavior, and (b) an accelerating technique for fundamental behaviors and complex processes. Operant conditioning, behavior modification, and precision teaching are described as comprising 3 principles: direct observation, continuous measurement, and systematic manipulation. Controversy over methodology in each of these areas is noted. It is concluded that generally, "the behavior modifier (a) is committed to individual diagnosis, treatment, and analysis; (b) is concerned with observable events and the direct measurement of their occurrence; (c) obtains several measures of a designated behavior before arriving at a decision or adjusting the environment; and (d) if change is warranted, manipulates systematically some aspect of the environment in order to reliably evaluate the effects of that variable."—S. Knapp.

1785. Lovitt, Thomas. (U. Washington, Coll. of Education) **Behavior modification: Where do we go from here?** *Exceptional Children*, 1970(Oct), Vol. 37(2), 157-167.—Outlines major trends in behavior modification. The growing discrimination between change and measurement is noted as establishing base lines for

currently unchangeable behaviors and normal behavior. The current interest in academic performance, as opposed to classroom behavior, may lead to a definition of the skills and materials necessary to the acquisition of academic skills. Research in this area may eventually answer the questions of how to evaluate (a) educational techniques and procedures, (b) the identification and arrangements of behaviors in a given process, and (c) proficiency and mastery levels. Studies of multiple measurement and change, generalization, parametric or component analysis, and pupil management are described and their importance to education noted.—S. Knapp.

1786. Macek, Karel & Záhorová, Alena. **Zvláštní školy internátní středočeského kraje.** [Special residential schools in central Bohemia.] *Psychológia a Patopsychológia Dieťaťa*, 1970, Vol. 5(3), 249-270.—Discusses the situation of residential special schools which have become special centers for children with social problems and academic underachievers. 162 pupils of 6 residential special schools were investigated in 1967. The sample consisted of newly accepted pupils and Ss with educational, character, and health problems. A team, consisting of social worker, pediatrician, psychologists, and child psychiatrist, collaborated in the investigation. Data suggest some peculiarities when compared to a population of normal children. Occupational maturity was often the cause of failure when placement of the Ss in a job or a social welfare institution was attempted. Possibilities of solutions are suggested and the need is stressed of establishing protected work places. Moreover, it appears to be necessary to afford further social protection to juveniles who, after leaving the special residential school, do not get adequate support in a properly functioning family. (Russian summary) (16 ref.)—*English summary*.

1787. Rigault, Geneviève & Gnyot, Yves. (Higher Normal School of Saint-Cloud, Lab. of Psychopedagogy, France) **Contribution à l'étude de l'organisation pré-linguistique chez le dyslexique.** [Contribution to the study of pre-linguistic organization and dyslexia.] *Bulletin de Psychologie*, 1969 1970, Vol. 23(4 5), 254-267.—Groups of dyslexic and nondyslexic pupils varying in age, sex, intelligence, and pathological involvement were examined for their reading, spelling, and word-association abilities. The nondyslexic group formed associations predominantly on the basis of semantics (83%), while the dyslexic group formed semantic associations to a much lesser degree (32%). 59% of their associations were formed on the basis of sound rather than meaning. Clinical aspects as well as certain hypotheses involving prelinguistic development, genetic factors, and the role of the school are discussed. R. E. Smith.

1788. Roth, Jay. (Newark State Coll.) **An intervention strategy for children with developmental problems.** *Journal of School Psychology*, 1970, Vol. 8(4), 311-314.—Describes a program for primary grade children with developmental and perceptual difficulties. 124 children met daily with specially trained teachers in their own schools to form a consistent meaningful group while they continued as members of their regular classes. To combat the destructive negative self-image of such children, the teacher and group stressed acceptance, openness, informality, and success. This, plus the program's esteem in the eyes of the child, seemed to affect the child's sense of his own worth. Continual

in-service training and sharing of teacher experiences were stressed. The teachers' facility for relating to the child was considered to be more relevant than the technique utilized.—*Journal abstract.*

1789. Seaman, Janet A. (Ventura Coll.) **Attitudes of physically handicapped children toward physical education.** *Research Quarterly*, 1970(Oct), Vol. 41(3), 439-445.—Describes an attitude scale to sample attitudes of orthopedically and neurologically handicapped secondary school children toward physical education. A self-rating scale and personal questionnaire were also used as criteria by which the validity of the attitude inventory could be checked. The 3 instruments were administered to 2 groups of orthopedically and neurologically handicapped children, 1 of which participated in a regular physical education program (N = 48), while the other took part in an adapted physical education program (N = 67). It was discovered that there was a significant difference in attitudes between means of the 2 groups. Ss in the regular physical education program had a more favorable attitude toward physical education than those in the adapted program. It was also found that the attitude scale was a highly reliable instrument with these Ss. There was a significant relationship between the attitude inventory score and the S's self-rated opinion of his attitude. Ss expressing the most favorable attitudes participated significantly more in physical activities outside the school than did the latter group.—*Journal abstract.*

Gifted

Remedial Education

1790. Thommes, Martin J. (United States International U., San Diego, Calif.) **Changes in values, perceptions, and academic performance of college freshmen underachievers in a remedial program.** *Dissertation Abstracts International*, 1970(Nov), Vol. 31(5-B), 2969-2970.

1791. Wolf, Montrose M., et al. (U. Kansas, Bureau of Child Research) **The timer-game: A variable interval contingency for the management of out-of-seat behavior.** *Exceptional Children*, 1970(Oct), Vol. 37(2), 113-117.—Demonstrated that the timer-game is a practical and effective procedure for managing out-of-seat behavior of elementary school children in a remedial classroom. The game allowed the Ss (N = 16) to earn token reinforcement by being in their seats whenever the bell of a kitchen timer rang. The bell rang once every 20 min. In a 2nd experiment, peer reinforcement was applied in conjunction with the timer-game to manage 1 S's out-of-seat behavior. Results indicate the peer reinforcement condition to be more effective than the individual points condition (i.e., the timer game).—*Journal abstract.*

Sensory & Physical Handicaps

1792. Hartung, Joseph E. (Georgia State U.) **Visual perceptual skill, reading ability, and the young deaf child.** *Exceptional Children*, 1970(Apr), Vol. 36(8), 603-608.—Evaluated visual perceptual skills of beginning readers. Greek and English trigrams were presented tachistoscopically to 30 orally trained deaf and 30 normally hearing children to test their ability to

recognize single symbols and recall trigrams. The performance of the 2 groups was essentially the same on recognition tasks, but normally hearing Ss performed significantly better on the recall task. Results suggest different processing strategies by the 2 groups of Ss. (16 ref.)—*Journal abstract.*

1793. Haskell, Simon H. & Anderson, Elizabeth M. (U. London, Inst. of Education, England) **The education of physically handicapped children in ordinary schools.** *Irish Journal of Education*, 1969(Sum), Vol. 3(1), 41-54.—Contrasts special education in Britain which favors the special school for the education of the handicapped with that in Sweden, where integration is now the key-word. The rationale underlying alternative systems (special school and special class) is considered; particular attention is given to the role of the boarding school in the education of the physically handicapped. It is concluded that without further research and the establishment of effective criteria, useful judgments about the relative merits of alternative systems of special education cannot be made. (17 ref.)—*Journal abstract.*

1794. Miller, William H. (Virginia School for the Deaf & Blind, Staunton) **Manifest anxiety in visually impaired adolescents.** *Education of the Visually Handicapped*, 1970(Oct), Vol. 11(3), 91-95.—Used the Anxiety Scale for the Blind to ascertain differences in anxiety levels between partially sighted and totally blind adolescents, and between students in special classes and those in Grades 9-12. No significant differences in levels of anxiety were found between partially sighted and totally blind Ss, or between Ss in special classes and those in regular classes. However, the anxiety level of students in the 11th and 12th grades was significantly greater than that for 9th and 10th grade students.—S. Appelle.

1795. Morse, John L. (Perkins School for the Blind, Watertown, Mass.) **The adaptation of a non-verbal abstract reasoning test for use with the blind.** *Education of the Visually Handicapped*, 1970(Oct), Vol. 11(3), 79-80. Blind 9th grade Ss were given adapted test items from the Abstract Reasoning subtest of the Academic Promise Tests to determine the feasibility of adapting this nonverbal abstract reasoning test for use with visually handicapped individuals. It is concluded that the "adapted test was reliable and possessed predictive validity... [and] performance on the adapted test was a function of the amount of vision and track placement of the Ss."—S. Appelle.

1796. Rawls, Rachel F. (North Carolina State U., Raleigh) **Training for increased comprehension with accelerated word rates in auditory reading media (compressed speech).** *Dissertation Abstracts International*, 1970(Oct), Vol. 31(4-B), 2263-2264.

1797. Tarjan, George. (U. California, Los Angeles) **Handicapped children in school: Reflections of a psychiatrist.** *California Mental Health Research Digest*, 1969, Vol. 7(2), 51-58.—Discusses the influence of a physical or intellectual handicap on the personality development of a handicapped child and the emotional reactions of his parents. The family environment and parental defense mechanisms have an important effect on the handicapped child's self-concept and emotional well-being as well as his school learning and performance. Desirable personality traits and attitudes of the special teacher of the handicapped are outlined. It is proposed that "an educational diagnostic system that would classify children according to their learning ability

the group, behavioral techniques, and setting.—*M. W. Linn.*

1802. **Hunter, Edna J.** (United States International U., San Diego, Calif.) **Habituation of electrodermal responses in children with specific reading disability.** *Dissertation Abstracts International*, 1970(Nov), Vol. 31(5-B), 2988.

1803. **Lit, Jack.** (Eastern Pennsylvania Psychiatric Inst., Philadelphia) **Emotional Influences in learning disability.** *Proceedings of the Annual Reading Institute*, 1968(Mar), Vol. 7, 107-114.—Reviews the organic bases of learning disability, and then develops at length the functional bases. Any reduction or restriction of a function may be classified as an inhibition of it. "Whether an emotionally based learning disorder is viewed as the reflection of a symptom or as a simple inhibition is purely an academic matter since the resolution requires the same approach—psychotherapy to understand and work through the block and educational therapy to aid in new learning." "In contrast to inhibitions, symptoms always involve the pathological process." 2 of the more common factors in learning disability rest with the child's anger and rebellion and his passive-aggressive way of handling this, and with the Oedipal conflict of the boy. The case history of a 15-yr-old boy, who was failing in school and experiencing attacks of anxiety at school, is presented.

1804. McGrady, Harold J. & Olson, Don A. (Northwestern U.) **Visual and auditory learning processes in normal children and children with specific learning disabilities.** *Exceptional Children*, 1970(Apr), Vol. 36(8), 581-589.—Compared the psychosensory functioning of 68 8-9 yr. old normal children and 31 8-9 yr. old children with specific learning disabilities. Each S was given an automated battery of 13 psychosensory tests representing various combinations of auditory and visual intra- and intersensory conditions for verbal, nonverbal-nonsocial, and nonverbal-social stimuli. On the psychosensory evaluation the learning disability groups made significantly more errors on the verbal psychosensory functions, regardless of the sensory conditions. The learning disability group also performed these tasks more slowly than normal Ss in nearly every comparison. (23 ref.)—*Journal abstract.*

1805. Wentland, Thomas J. (U. Wisconsin) **A test of conceptual categorization.** *Dissertation Abstracts International*, 1970(Oct), Vol. 31(4-B), 2347-2348.

Emotional Disorder

1806. Cohen, Boaz & Jones, Howard L. (St. Joseph's Hosp., Children's Day Treatment Program, Syracuse, N.Y.) **Establishing a science curriculum for aggressive children.** *Science Teacher*, 1969(Nov), Vol. 36(8), 61-63.—Discusses the special needs of the aggressive child as a basis upon which to structure the teaching of science. Objectives of the curriculum should include: (a) appropriate success measures; (b) channeling aggressive impulses into positive learning experiences; and (c) selection of science concepts, principles, and skills which emphasize order and balance in the universe to compensate for deficits in senses of order, routine, responsibility, and planning. It is proposed "that the foundation of science education for aggressive children be teacher-pupil-initiated, pupil-performed, and pupil-actualized success-producing tasks that enhance

the child's self-concept and promote his ego growth."

—P. Zell.

1807. **Husaini, Bagar A.** (Wayne State U.) **An evaluation of nursery school experiences in a project for emotionally disturbed children.** *Journal of Experimental Education*, 1969(Win), Vol. 38(2), 59-65.—Reports upon the effectiveness of nursery school experiences provided for 38 preschool siblings of emotionally disturbed children in a special program. Results of a multiple comparison design indicate a significant gain in the language and nonlanguage IQ scores for the experimental Ss. These gains were particularly noticeable in such areas as logical and numerical reasoning, verbal concepts, and memory. Interpretation of the results and their significance relative to curricula for deprived children at the preschool level are presented.—*Journal abstract*.

1808. **Thomas, Elizabeth C. & Yamamoto, Kaoru.** (U. Virginia) **Emotionally disturbed children and their school related perceptions.** *Exceptional Children*, 1970(Apr), Vol. 36(8), 623-624.—Investigated the differential perceptions of 3 age levels of emotionally disturbed children concerning people and curriculum. 46 10-17 yr. old Ss in a school within a psychiatric institution (representing elementary, and junior and senior high levels) rated 4 people concepts (classmates, parent, teacher, and myself) and 4 curriculum concepts (social studies, language, science, and mathematics) on semantic differential scales. A factor analytic study identified 2 curriculum factors (vigor and certainty) and 3 people factors (movement, security, and merit). Results show no over-all significant differences among the age groups on any of the people or curriculum factors, with the exception of elementary Ss, whose ratings on "myself" were consistently higher than those of the 2 older groups. Reasons for the uniformity in ratings are discussed.—P. McMillan.

COUNSELING & GUIDANCE

1809. **Andrews, W. R.** (Queen's U., Kingston, Ontario, Canada) **Behavioral and client-centered counseling of high school underachievers.** *Journal of Counseling Psychology*, 1971(Mar), Vol. 18(2), 93-96.—Compared 2 treatments as to their effectiveness in reducing anxiety and raising achievement. A combination of desensitization and reinforcement was given for 10 interviews to 1 treatment group of 16 high-anxious high school matriculation boys who showed above average intelligence and below average marks. Client-centered counseling was given to a similar group of 16 Ss. Using an analysis of variance, pretreatment and posttreatment normalized T scores were compared for treatment and control (N=16) groups on 2 anxiety scales and 4 academic marks. Significant anxiety reduction occurred in the behavioral group. Immediately following treatment, no improvement in achievement had occurred. Some implications are discussed. (16 ref.)—*Journal abstract*.

1810. **Baer, Donald M.** (U. Kansas) **The consultation process model as an irrational state of affairs.** *Psychology in the Schools*, 1970, Vol. 7(4), 341-344.—Summarizes the papers by J. R. Bergan, J. R. Barclay, R. J. Wetzel, D. R. Curry, and R. W. Henderson (see PA, Vol. 46:Issue 1) presented at a symposium entitled Practice and Training with a Consultation Process Model given at the 1969 Annual Meeting of the American Psychological Association.—H. Kaczkowski.

1811. **Bergan, John R.** (U. Arizona) **A systems**

approach to psychological services. *Psychology in the Schools*, 1970, Vol. 7(4), 315-319.—Describes the "Computer-Assisted Psychological Services System (CAPS)" that is being implemented as part of the Follow Through Implementation Program of the Arizona Center for Early Childhood Education." The focus of CAPS is on knowledge and skills in system components rather than in individual practitioners. Objectives, components, and functions are discussed.—H. Kaczkowski.

1812. **Cornfeld, Charlotte & Goldstein, Albert.** (Los Angeles Valley Coll.) **Group counseling with college students: A cooperative project.** *Journal of Jewish Communal Service*, 1970(Fal), Vol. 47(1), 64-69.—Describes the results of the efforts of a college, Hillel Council, and a family service agency in integrating their services to offer personal counseling to college students. These efforts were prompted by a recognition of the dearth of professional services for college students with emotional problems. Counseling was begun with 10 students. The cocounselors were a case-worker from a university and a social work student from the same school. 11 sessions were planned, though some of the students did not make all the sessions. The feedback was favorable. The students said they would recommend the counseling to their peers, the Director of Student Activities indicated significant personality changes in the students, and the social work students emphasized their own increased understanding. The main themes of the case-worker were emancipation from home, heterosexual relationships, and vocational goals. S. R. Diamond.

1813. **Curry, Dal R.** (U. Arizona) **Case studies in behavior modification.** *Psychology in the Schools*, 1970, Vol. 7(4), 330-335.—Implementation of the Computer-Assisted Psychological Services consultation process model is in 4 stages: problem identification, problem analysis, intervention, and evaluation. 2 case studies are presented to illustrate the consultation process. In the 1st case, lack of progress in learning to read by an 8-yr-old girl was improved in 6-mo time by the use of interventions which attempted to reduce "the attention lavished upon her by the concerned adults in her environment." In the 2nd case, aggressive and disruptive behavior in a 6-yr-old boy was successfully controlled by arranging his "environment so that inappropriate behavior would result in the removal of a positive reinforcer." —H. Kaczkowski.

1814. **Dore, Russell L.** (U. Washington) **Self concept and interests related to job satisfaction of managers.** *Dissertation Abstracts International*, 1970(Oct), Vol. 31(4-B), 2338.

1815. **Fenix, Yolanda.** (U. Manila, Philippines) **Correlates of counseling appropriateness in Manila college students.** *Philippine Journal of Psychology*, 1969(Dec), Vol. 2(2), 23-34.—Attempted to identify the counselor's role as perceived by 235 college students. This role is defined in terms of the problems seen as appropriate to discuss with a counselor at a counseling center. Vocational problems were considered most appropriate to discuss with a counselor by both male and female Ss. In addition, an attempt is made to identify the personal-social variables of college students related to their perceptions of counseling appropriateness. The personal-social variables found to be significant were mother's education, knowledge of the guidance office, amount of self-disclosure, sex, and counseling experience. (24 ref.)—*Journal abstract*.

1816. **Fiman, Byron G.** (New York U.) **An inves-**

ligation of the relationships among supervisory attitudes, behaviors, and outputs: An examination of McGregor's theory Y. *Dissertation Abstracts International*, 1970(Oct), Vol. 31(4-B), 2338.

1817. Ford, Blake & Koziey, P. W. (Red Deer Junior Coll., Alberta, Canada) **Differential perceptions of the school counselor's role.** *Alberta Journal of Educational Research*, 1969(Dec), Vol. 15(4), 245-253.—Hypothesized that significant differences exist among students, counselors, and counselors' perceptions of students' perceptions regarding types of problems considered appropriate for counselor-student discussions. 434 11th grade students and 46 high school counselors responded to a questionnaire on which they rated 73 items on 4 scales (personal, social, educational, and vocational) for their degree of appropriateness for counsel-student discussion. The counselor also rated each item as he thought students would rate it. Analysis of variance results confirm the hypothesis. However, while counselors perceived all 4 types of problems to be more appropriate for counselor involvement than did students, differences on the educational and vocational scales were slight as compared with differences on the personal and social scales. The degree to which counselors were not aware of students' perceptions is considered 1 of the most significant findings. It is concluded that results support the argument that the nature of the counselor's work is determined more by role expectations than by the training and competence he possesses, and that the counselor must recognize a responsibility to make the public aware of his competencies and the areas in which he is prepared to use them.—M. Maney.

1818. Gredler, Gilbert. (Temple U.) **The school psychology program at Temple: Projects undertaken by students: The contribution of a training program to the public school.** *Psychology in the Schools*, 1970, Vol. 7(4), 351-355.—Reviews a number of projects undertaken by students in school psychology to enhance their utility in a school setting. The examples help "demonstrate that students in a training program in school psychology can combine their talents with the needs of the school district to aid in implementing the educational objectives of our society."—H. Kaczowski.

1819. Haase, Richard F. (U. Massachusetts) **Canonical analysis of the Vocational Preference Inventory and the Strong Vocational Interest Blank.** *Journal of Counseling Psychology*, 1971(Mar), Vol. 18(2), 182-183.—Performed a canonical correlation analysis on the responses of 176 male undergraduates to Holland's Vocational Preference Inventory (VPI) and the SVIB. 6 canonical roots were extracted and correlations between the original VPI and SVIB variables and the canonical roots were obtained. The 6 dimensions were interpreted and assigned conceptual labels suggested by the primary contributing VPI and SVIB variables. Common features underlying the 2 scales are discussed.—*Journal abstract*.

1820. Houston, B. Kent. (U. Kansas) **Sources, effects, and individual vulnerability of psychological problems for college students.** *Journal of Counseling Psychology*, 1971(Mar), Vol. 18(2), 157-165. Reviews research on the sources and effects of psychological problems for college students and on identifying students who are particularly vulnerable to the adverse effects of their problems. As expected, the general academic area is the most consistent problem area. College students' problems may adversely affect their psychological adjustment and/or academic performance. Use of

MMPI scales appears promising for identifying students who are currently having difficulty or are likely to have difficulty in the future with psychological adjustment. Anxiety measures may be related to current or future academic performance in some complex, as yet unclear, fashion. Measures of psychological adjustment appear to be better predictors of future than concurrent academic performance. (54 ref.)—*Journal abstract*.

1821. Hurst, James C. & Morrill, Weston H. (Colorado State U.) **Personal versus general requests for client feedback in evaluating counseling services.** *Journal of College Student Personnel*, 1971(Jan), Vol. 12(1), 32-35.—Attempted to determine whether or not the content and percentage of responses would differ between former clients of a counseling center who received personal vs. general letters to a posttermination questionnaire. A total of 282 former clients received the Counseling Services Assessment Blank (CSAB) which attempts to evaluate client's perceptions of counselor helpfulness, satisfaction with services received, and resulting therapeutic growth in relation to the problems they perceive themselves as having. 3 criteria (i.e., perceived counselor helpfulness, expressed satisfaction with counseling, and client-perceived therapeutic growth) were used to assess differential effects that personal and general requests for feedback from clients might have on responses to the CSAB. Results indicate that "post-termination questionnaires sent under personal cover letters elicit responses that are not systematically different from those sent under a general cover letter."—R. H. Mueller.

1822. Kraft, Arthur. (Long Beach, Unified School District, Calif.) **Time out.** *Journal of School Psychology*, 1970, Vol. 8(4), 291-295.—Recommends that the school psychologist conduct 5-min discussions with entire classes with the teacher present. Discussions should be partially or wholly unstructured so that students can speak freely. Student comments are received non-judgmentally but with empathy. Students and teacher gain an appreciation of others' ideas and feelings. Excerpts from a tapescript of a session with a 4th grade class are included. The psychologist could help the teacher conduct sessions on his own. The procedure seems adaptable to the secondary level.—*Journal abstract*.

1823. Krienke, John W. (U. Florida) **Cognitive differentiation and occupational-profile differentialiation on the Strong Vocational Interest Blank.** *Dissertation Abstracts International*, 1970(Nov), Vol. 31(5-B), 2961.

1824. Lubetkin, Barry S. (Kent State U.) **Televised analysis of communication (TACOM): It's relation to counseling change: A methodological study.** *Dissertation Abstracts International*, 1970(Oct), Vol. 31(4-B), 2287.

1825. Perdomo, Roberto. (U. Valle, Medical School, Cali, Colombia) **Utilización del servicio psiquiátrico estudiantil en la Universidad del Valle.** [Use of the Students' Psychiatric Services in the University del Valle.] *Acta Psiquiátrica y Psicológica de América Latina*, 1970(Sep), Vol. 16(3), 286-293.—Describes epidemiological data of the students attending to the Students' Psychiatric Services of the University del Valle. The main finding is that a statistically significant greater number of students from the Faculty of Medicine attended to the Services. This is interpreted as indicating that medical students had a greater contact with the psychiatric

service (because it is a branch from Medicine, and it is located in the same building) and hence had a greater possibility to attend to it.—V. A. Colotla.

1826. **Pierce, Richard M. & Schauble, Paul G.** (Michigan State U.) **Follow-up study on the effects of individual supervision in graduate school training.** *Journal of Counseling Psychology*, 1971(Mar), Vol. 18(2), 186-187.—Followed up 14 counselor-trainees who had been part of an earlier study assessing the effects of high- and low-functioning supervisors on their supervisees. Results indicate that (a) the supervisees of the high-level supervisors continued to function more effectively on the measured dimensions than the supervisees of the low-level supervisors; and (b) neither the supervisees of the high-level or low-level supervisors tended to change significantly on the measured dimensions.—*Journal abstract*.

1827. **Schwartz, Joseph.** (Richmond Coll., City U. New York) **Comment on "Expert" and "Inexpert" counselors.** *Journal of Counseling Psychology*, 1971(Mar), Vol. 18(2), 180-181.—Subjects L. D. Schmidt and S. R. Strong's (see PA, Vol. 44:9304) data on student ratings of the expertness of counselors vs. training and experience of the counselors to a least-squares test. Data indicate that expertness as judged by 37 male students is not correlated in any simple way with experience but rather that Ss liked 1 of the counselors, disliked another, and thought the remaining 4 were about the same.—*Journal abstract*.

1828. **Sharp, W. Harry & Marra, Herbert A.** (U. Wyoming) **Factors related to classification of client problem, number of counseling sessions, and trends of client problems.** *Journal of Counseling Psychology*, 1971(Mar), Vol. 18(2), 117-122.—Attempted (a) to determine if clients seen at a university counseling and testing center were representative of the total student population; (b) to study the relationship between certain descriptive variables, classification of client problem areas, and number of counseling interviews; and (c) to ascertain trends in problems presented by 594 clients during an 8-yr period. In terms of the variables studied, the client sample differed significantly from the student population only in terms of age, with more younger Ss using the service. 5 modal patterns were evident when clients were considered by number of counseling interviews and by problem-goal areas. Over an 8-yr period, the proportion of clients classified by problem-goal area shifted significantly.—*Journal abstract*.

1829. **Siegel, Alan E.** (Boston U., School of Education) **Relationships among uni- and multi-dimensional alienation constructs and social interaction/behavior variables: A survey of college freshmen.** *Dissertation Abstracts International*, 1970(Nov), Vol. 31(5-B), 2969.

1830. **Stahmann, Robert F.** (U. Iowa) **Test review.** *Journal of Counseling Psychology*, 1971(Mar), Vol. 18(2), 188-192.—Reviews (a) the Kuder Preference Record—Occupational (Form D)—developed for use with male high school and college students and adults, which provides separate scores for specific occupations or occupational groups; (b) the Kuder General Interest Survey (Form E) for use in Grades 6-12; and (c) the Kuder Occupational Interest Survey (Form DD) which is scored on occupations and college majors for men and women.—M. West.

1831. **Stamps, Louis W.** (Ohio State U.) **The effects of intervention techniques on fear of failure behav-**

ior. *Dissertation Abstracts International*, 1970(Oct), Vol. 31(4-B), 2267-2268.

1832. **Stephenson, Norman L.** (U. Minnesota) **Some empirical relationships of an actuarial pattern analysis of basic scales of the Strong Vocational Interest Blank.** *Dissertation Abstracts International*, 1970(Nov), Vol. 31(5-B), 3011.

1833. **Thomas, Charles W.** (Center for the Study of Racial & Social Issues, Los Angeles, Calif.) **Black-white campus issues and the function of counseling centers.** In F. F. Kortan, S. W. Cook, & J. I. Lacey (Eds.), "Psychology and the problems of society." (See PA, Vol. 46:Issue 1) 420-426.

1834. **Westman, Jack C.** (U. Wisconsin Hosp., Madison) **Psychiatric contributions to school health programs.** *Hospital & Community Psychiatry*, 1968(Aug), Vol. 19(8), 258-260.—Discusses the need for psychiatric consultation to be available to schools. Many psychiatrists see "the school as a potential mental health resource and as the principal screening device for early detection of emotional problems in children." Various ways a psychiatrist functions in a school system and the unique contributions he can make are detailed.—B. A. Burkard.

PERSONNEL

1835. **Barclay, James R.** (U. Kentucky) **Evaluating behavior changes in school psychologists.** *Psychology in the Schools*, 1970, Vol. 7(4), 320-324.—Presents "in summary form some of the major findings of research of 2 institutes for school psychologists" sponsored by the National Defense Education Act. The focus is on techniques and types of measurements used. It "is felt from analysis of the data and from feed-back from teachers, psychologists and school districts that these 2 experiences effected considerable change in the methods and procedures used in psychologist-teacher consultation. Not only was the social learning model of school psychology practice field-tested in a rigorous manner, but evidence from a variety of statistical and empirical sources suggests that these evaluation techniques yield strong support for this type of in-service training and consultation. Finally, the use of closed-circuit television joined to intensive didactic experience appears to be a potent teaching method."—H. Kaczkowski.

1836. **Bluestein, Venus W. & Milofsky, Charles A.** (U. Cincinnati) **Certification patterns and requirements for school psychologists.** *Journal of School Psychology*, 1970, Vol. 8(4), 270-277.—Sent a questionnaire to 50 state superintendents of public instruction and to directors of education in 5 United States territories. Information was requested relevant to state certification for school psychologists, including minimal academic, teaching, and internship requirements. 55 questionnaires were returned. 44 states and territories indicated certification standards which are subsequently discussed in detail. Trends noted are: more states requiring certification for school psychologists, higher academic requirements, increasing levels of certification, and a shift away from a mandatory teaching certificate for state certification as a school psychologist.—*Journal abstract*.

1837. **Friesen, D. & Bumbarger, C. S.** (U. Alberta, Edmonton, Canada) **An experiment in attitude change.** *Alberta Journal of Educational Research*,

1970(Dec), Vol. 16(4), 211-216.—Administered a pretested semantic differential test to 45 school superintendents, school board members, and school board personnel to assess their attitudes toward data processing in education. All personnel attended a conference. The difference between pre- and posttest scores indicate a change toward favoring data processing. A follow-up of 40 of the participants, however, revealed a reversion to the pretest attitude level.—*N. M. Chansky.*

1838. Pielstick, N. L. (Northern Illinois U.) **The appropriate domain of the school psychologist.** *Journal of School Psychology*, 1970, Vol. 8(4), 317-321.—Argues that efforts to delineate the roles and functions of school psychologists for the purpose of establishing national guide lines are useless. The "appropriate domain" is a function of the competencies and interests of the psychologist, the characteristics of the situation in which he works, and the effects of their interaction. Preparation in basic areas of behavior and psychological methodology are advocated as essential for adaptability to changes and development of leadership in this field. Efforts should be devoted to increasing effectiveness in the use of psychological knowledge and methods in the school setting.—*Journal abstract.*

1839. Rowitch, Jerome. (Los Angeles County Dept. of Mental Health, Calif.) **Group consultation with school personnel.** *Hospital & Community Psychiatry*, 1968(Aug), Vol. 19(8), 261-266.—Describes a school consultation program in which the consultants, many of whom were from private practice, worked with 2 groups: specialty and integrated. Specialty group consisted of principals, counselors, speech therapists, etc. Totally integrated groups included authority figures, and were considered more effective than the partially integrated groups. Various phases which evolved in consultation with specialty groups are defined. For teachers there were 3 phases: case-oriented discussion, general concepts and teachers' attitudes, and program and philosophy of the school system. In the case of administrators, Phase 1 concerned general problems in the school organization, Phase 2 was case-oriented, and Phase 3 included program and philosophy. Consultation techniques were explored and their application is illustrated in a discussion of work with school personnel in children's centers.—*B. A. Burkard.*

1840. Wetzel, Ralph J. (U. Arizona) **Behavior modification techniques and the training of teacher's aides.** *Psychology in the Schools*, 1970, Vol. 7(4), 325-330. "5 trainee groups, each composed of a teacher and 2 or more aides and volunteers, participated in the 4-wk training program . . . 7 Ss were Negro, 5 Mexican-American, and 2 Anglo . . . The following are illustrative of principles used in the instructions to the trainers": teaching observing behavior, modeling by the training staff, providing corrective feedback, and discussing behavior. Discussed briefly are "data from 4 training assessment procedures used with" the program, video tapes, behavioral measures of training effects, a behavioral task, and attitude measure.—*H. Kaczowski.*

1841. Zach, Lillian. (Yeshiva U.) **Training psychologists for the urban slum school.** *Psychology in the Schools*, 1970, Vol. 7(4), 345-350. Describes a re-training program for school psychologists which "requires each trainee to spend 1 full day a week in a city school during the 3 yr. of his study before embarking on his internship." The 2 goals were a rapprochement between educators and psychologists themselves who

were to be directly in the milieu of the disadvantaged child in the urban slum school . . . As simple as our projected goals may have seemed, we have learned that implementation of programs to achieve them is a complicated and difficult task, particularly when carried out in a societal framework that is changing so rapidly.—*H. Kaczowski.*

Teachers & Teacher Training

1842. Anderson, D. S. & Western, J. S. (Australian National U., Canberra) **State differences in authoritarian attitudes.** *Australian Journal of Psychology*, 1970(Dec), Vol. 22(3), 261-264.—An international study of teacher roles has reported Queensland teachers as being more authoritarian and less child-centered than teachers in other Australian states. Similar differences were found between Victoria and Queensland on the same items for university students intending to become teachers. Scores on an Attitude Inventory taken by the same teacher trainees and other students in engineering, law, and medicine in several states at the commencement of their courses suggest that the attitudes predate training and that relative "authoritarianism" is characteristic of Queensland university students generally.—*Journal abstract.*

1843. Biggs, J. B. (U. Alberta, Edmonton, Canada) **Personality correlates of certain dimensions of study behaviour.** *Australian Journal of Psychology*, 1970(Dec), Vol. 22(3), 287-297.—Investigated study strategies which appeared in an analysis of a previous study by J. B. Biggs on the general natures of the tasks facing science and art students. These strategies were embodied in a questionnaire and correlations with performance and personality measures were obtained. Correlations were found between the strategies and certain personality characteristics, including extreme response set, dogmatism, neuroticism, extroversion, and divergence. Results support both the earlier interpretations of particular strategies, and the hypothesis that such strategies mediate between particular personality variables and the task. (19 ref.)—*Journal abstract.*

1844. Currie, Billye R. (U. Southern Mississippi) **The teacher as a variable in the use of operant techniques in the classroom.** *Dissertation Abstracts International*, 1970(Oct), Vol. 31(4-B), 2254.

1845. Hartley, James & Holt, Janet. (U. Keele, England) **A note on the validity of the Wilson-Patterson measure of conservatism.** *British Journal of Social & Clinical Psychology*, 1971(1 Feb), Vol. 10(1), 81-83.—Describes the application of the 1st of the G. D. Wilson and J. R. Patterson (see PA 43-15017) measure of conservatism on undergraduates, graduate students, teachers, college administrators, and teacher counselors. Scores of different S groups were correlated with other items. This included 28 teachers who were also given the authors' teacher attitude questionnaire. Results show that there was more discrimination between teachers with the latter. It is concluded that social desirability can affect questionnaires employing the Wilson and Patterson technique.—*P. Hertzberg.*

1846. Richek, Herbert G. (U. Oklahoma) **Jung's typology and psychological adjustment in prospective teachers: A preliminary investigation.** *Alberta Journal of Educational Research*, 1969(Dec), Vol. 15(4), 235-243.—Investigated the difference between Jungian, Freudian, and other theories of personality as to whether

extroversion/introversion is related to psychological adjustment. The Myers-Briggs Type Indicator (MBTI) and the Bown Self-Report Inventory (SRI) were administered to 365 female undergraduates applying for admission to teacher certification programs. On the basis of the MBTI scores, Ss were classified as extroverts ($N = 229$) or introverts ($N = 136$) and then further categorized as extreme or moderate. It was found that (a) extroverts scored higher on the SRI measures of psychological adjustment, while extreme introverts scored lower than moderate introverts; and (b) extroverts showed more positive perceptions of children than introverts, while the extremes did not differ from the moderates in either category. Limitations of the study are discussed. It is concluded that "even if it were definitely established that extroverts in youth are psychologically healthier than introverts, it would not necessarily follow that introverts make less effective teachers." (16 ref.)—S. Knapp.

1847. Wiechel, Lennart. (Pedagogico-Psychological Inst., Malmö, Sweden) *Ett rollspel i lärarutbildningen: En variansanalytisk studie jämte principer för metodval och konstruktion av utbildningsspel*. [Role-playing in teacher training: An analysis of variance and an outline of means in constructing educational games.] *Pedagogisk-Psychologiska Problem*, 1970(Apr), No. 108, 78 p.—Following a brief review of literature pertinent to the use of educational games, a study is described which shows the effects of a role-playing situation on the teaching attitudes of Swedish student teachers. Analysis of variance shows that the role-playing experience influenced participants in the direction of a more sympathetic yet critical teaching attitude. Techniques in the use of educational games in training student teachers are also described, with emphasis on problems in content analysis, implementation, and evaluation of results. (3 p. ref.)—D. W. Scott.

SCHOOL LEARNING & ACHIEVEMENT

1848. Asch, Harvey. (New York U.) *An investigation and attempted modification of classificatory style among disadvantaged preschool children*. *Dissertation Abstracts International*, 1970(Nov), Vol. 31(5-B), 2949.

1849. Bayuk, Robert J., Proger, Barton B., & Mann, Lester. *Organization of meaningful verbal material*. *Psychology in the Schools*, 1970, Vol. 7(4), 365-369.—Tested Ausubel's "organizer" concept on 123 high school juniors and seniors from 6 English classes using a 2700-word article on instincts and motivation. The results from a $2 \times 2 \times 2 \times 3$ analysis of variance design indicate that the mode of the organizer is differentially effective over 3 levels of ability. The discussion reflects some of the problems inherent in testing the organizer concept.—H. Kaczowski.

1850. Bloomer, Richard H. (U. Connecticut) *Reading patterns of the rejected child*. *Reading Teacher*, 1969(Jan), Vol. 22(4), 320-324, 340.—Results indicate that the teacher is far more important than the method. It is further suggested that (a) a methodology which relies exclusively on the components of any one, specific instructional approach should be abandoned, and (b) it would be desirable to modify kindergarten programs for disadvantaged children where such programs are concerned mainly with fostering social and emotional growth. CRAFT results have shown a significant

relationship between teacher satisfaction with a method and her results with it.—P. D. Leedy.

1851. Breton, Gabriel R. (U. Michigan) *The influence of interaction between personality and environment on educational outcomes*. *Dissertation Abstracts International*, 1970(Nov), Vol. 31(5-B), 2953.

1852. Costin, Frank. (U. Illinois) *Hostility and learning in an introductory psychology course*. *Psychology in the Schools*, 1970, Vol. 7(4), 370-374.—Tested the relationship between hostility and learning with 50 men and 51 women in a beginning psychology course. Results indicate a significant negative correlation between hostility and achievement. The correlations were higher for men than women.—H. Kaczowski.

1853. Gopal Rao, D. (V. M. National Inst. of Co-operative Management, Poona, India) *A study of some factors related to scholastic achievement*. *Indian Journal of Psychology*, 1970(Jun), Vol. 45(2), 99-120.—Establishes the effect of factors, e.g., individual intelligence of the pupils and of their scholastic achievement. 500 8th grade boys of Higher School were selected at random. The following independent variables were selected: individual intelligence, study habits, socioeconomic status, and school attitude; the dependent variable was scholastic achievement expressed in grade marks. Intelligence was measured by using the CIE group intelligence test; the socioeconomic status was expressed numerically by using B. Kuppaswamy's Socioeconomic Status Scale. Study habits were determined by asking a series of prepared questions and using a rating scale. Measurement of school attitude was based on the Likert technique of attitude scale construction. Achievement was measured by using the Jamia Achievement Test Battery and taking the cumulative score on social studies, general science, and mathematics. The techniques of multiple correlation and multiple regression were applied, and correlation coefficients, regression equation, and its coefficients were determined. It was found that the student's intellectual level was the predominant factor which determined his scholastic achievement. 64% of the variations in achievement are accounted for by variations in intelligence ($r = .8$). Socioeconomic status was related to intelligence ($r = .45$); no substantial relationship existed between study habits or school attitude and intelligence. (20 ref.)—I. Halev.

1854. Hogan, Thomas P. (Forham U.) *Socioeconomic community variables as predictors of cognitive test performance of school children*. *Dissertation Abstracts International*, 1970(Nov), Vol. 31(5-B), 2959.

1855. Kakkar, S. B. (State Coll. of Education, Patiala, India) *Family conflicts and scholastic achievement*. *Indian Journal of Psychology*, 1970(Jun), Vol. 45(2), 159-164.—Explores the hypothesis that the IQ and scholastic achievement of children is influenced by interparental conflicts. The sample consisted of 125 pairs of suburban parents and their 3rd-5th grade children (total $N = 214$), about $\frac{2}{3}$ of whom participated in the study. Interparental differences were scored in accordance with the answers supplied by a distributed questionnaire. The children were subdivided into 3 groups: "small," "average," and "big." The "small" group corresponded to the lowest parental differences score, etc. Criteria of IQ and scores for children were found through Lorge-Thorndike Intelligence Test-Form A, Level 3, and scholastic achievement scores were found from school records of the children. It was found that the

IQ and scholastic achievement of children were in an inverse relationship to the parental differences. IQ and scholastic achievement were not affected by the child's sex. It is suggested that a study be made of child's behavior as influenced by interparental conflicts.—*I. Halev.*

1856. Lesiak, Walter J. (Ohio State U.) **The relationships of the internal-external locus of control dimension to scholastic achievement, reflection-impulsivity and residence in priority areas.** *Dissertation Abstracts International*, 1970(Oct), Vol. 31(4-B), 2285-2286.

1857. Liem, Glenn R. (U. Rochester) **The effects of decision-making power on performance and task-related attitudes.** *Dissertation Abstracts International*, 1970(Oct), Vol. 31(4-B), 2286.

1858. Lin, Yi-Guang; McKeachie, Wilbert J., Wernander, Marilyn, & Hedegard, James. (U. Michigan) **The relationship between student-teacher compatibility of cognitive structure and student performance.** *Psychological Record*, 1970(Fal), Vol. 20(4), 513-522.—Describes 4 studies testing P. J. Runkel's hypothesis that compatibility of cognitive structure between teacher and students would facilitate student learning and performance. Ss were 110, 201, 65, and 60 undergraduates in each study, respectively. Results using Runkel's collinearity method failed to support the hypothesis and produced a greater reduction of confidence in the method than in the hypothesis.—*Journal abstract.*

1859. Margenau, Eric A. (New York U.) **The effect of a Job Corps rehabilitation program on the occupational aspirations of a group of disadvantaged youth.** *Dissertation Abstracts International*, 1970(Oct), Vol. 31(4-B), 2259-2260.

1860. Marion, Tovah S. (Boston U., School of Education) **An adaptation of the Tasks of Emotional Development (T.E.D.) Test for black lower class children, and its relationship to academic achievement.** *Dissertation Abstracts International*, 1970(Nov), Vol. 31(5-B), 2997.

1861. May, John R. (U. North Carolina, Chapel Hill) **An exploration of family systems in relation to children's school performance.** *Dissertation Abstracts International*, 1970(Nov), Vol. 31(5-B), 2997-2998.

1862. Russo, William J. (St. John's U., Jamaica, N.Y.) **Relationship between dogmatism and academic achievement among male academic high school students.** *Dissertation Abstracts International*, 1970(Nov), Vol. 31(5-B), 2966.

1863. Schwartz, David J. (Juvenile Probation Dept., Hillcrest Mental Health Unit, Belmont, Calif.) **The reality of illusion and the illusion of reality.** *Science Teacher*, 1969(Sep), Vol. 36(6), 29-31.—Defines the nature of learning as a process of interaction and change based on pleasure or pain stimulation. It is suggested that in the Western Judeo-Christian tradition, pain has become the primary educational stimulus, with fear and become the primary educational derivatives. The painful stimulation may arise from uncertainty about the future, worry in the anticipation of change, fear resulting from sudden change, or boredom from lack of stimulation or challenge—as in contemporary education. A child becomes conditioned through interaction by religion, science, and tradition, to associate change and learning with pain and control. It is concluded that teachers "will have become true educators or change agents when the

children perceive us as not being bored with our own lives; know that we are not afraid to change, feel that we can give up our need to control them.... They want to use us as models but not out of fear, not because of our control, but by their own choice."—*P. Zell.*

1864. Tagatz, Glenn E., Lemke, Elmer A., & Meinke, Dean L. (Marquette U.) **The relationship between conceptual learning and curricular achievement.** *Journal of Experimental Education*, 1969(Win), Vol. 38(2), 70-75.—Examined the relationship between performance on concept attainment tasks and information processing tasks and performance on selected curricular achievement tests through factor analytic procedures. 20 males and 20 females from the 7th-9th grades served as Ss. Results indicate that information processing of exemplar information and concept attainment of exemplar information are highly related to curricular factors. Other specific information processing factors, i.e., science and spelling, were only moderately related to curricular achievement. From these relationships, there is probably a high relationship between exemplar information processing and concept attainment of exemplar information with curricular factors generally and that more liberal generalizations of research results from tightly controlled experimental settings to conventional learning situations seem justified.—*Journal abstract.*

Prediction

1865. Brothers, Cassandra T. (U. Houston) **The construction, validation, analysis, evaluation and comparison of scales for predicting academic success in college.** *Dissertation Abstracts International*, 1970(Nov), Vol. 31(5-B), 2953.

1866. Keogh, Barbara K. & Smith, Carol E. (U. California, Los Angeles) **Early identification of educationally high potential and high risk children.** *Journal of School Psychology*, 1970, Vol. 8(4), 285-290.—Investigated early identification of educationally high potential and high risk children by following the same children (N = 49) from kindergarten entrance through Grade 5 of a regular school program. Kindergarten predictive measures were the Bender Gestalt Test and teachers' evaluations; follow-up measures were yearly standard achievement test results. Analyses revealed consistently high and significant relationships between teachers' ratings and subsequent school achievement. Teachers were surprisingly accurate in early identification of both high risk and high potential children. The Bender Gestalt was more accurate for identification of high potential than high risk children. Findings support the use of these measures for initial screening children entering formal school programs. Specification of dimensions of teachers' evaluations may provide clues to understanding the complexities of school readiness.—*Journal abstract.*

1867. Rardin, Donald R. & Moan, Charles E. (U. Florida) **Frustration tolerance and college grade point average.** *Perceptual & Motor Skills*, 1970(Dec), Vol. 31(3), 1003-1006. Presented 22 male and 22 female undergraduates with an insoluble finger maze as a measure of frustration tolerance. Simple and multiple correlations of frustration tolerance, School and College Achievement Test (SCAT) scores, and GPA showed frustration tolerance to be a relevant factor in the prediction of college GPA for males but not for females

and when in combination with SCAT Quantitative scores for both sexes.—*Journal abstract.*

1868. **Rose, Harriett A.** (U. Kentucky) **Prediction and prevention of freshman attrition.** *Dissertation Abstracts International*, 1970(Oct), Vol. 31(4-B), 2264.

1869. **Shouksmith, George.** (Queen's U., Belfast, Ireland) **Validity studies with a test of high-level reasoning.** *Irish Journal of Education*, 1969(Win), Vol. 3(2), 117-122.—Employed a measure of high-level reasoning, the Canterbury Reasoning Test (CRT), employed in 2 studies, aimed at establishing its construct and predictive validity. Data from a factorial study with 50 undergraduates provide evidence for the construct validity of the test as a measure of 2 basic aspects of high-level reasoning: (a) logical reasoning, and (b) pure associative reasoning. A practical study carried out for the New Zealand Forest Service, using 34 forester cadets, suggests that the CRT has some validity as a predictor of success in university studies.—*Journal abstract.*

1870. **Simpson, Robert L.** (California State Coll., Fullerton) **Reading tests versus intelligence tests as predictors of high school graduation.** *Psychology in the Schools*, 1970, Vol. 7(4), 363-365.—Compared the effectiveness of individual intelligence tests (WISC and WAIS) to that of individual reading achievement tests (Wide Range Achievement Test and Gilmore Oral Test) in predicting success for low achievers. The sample consisted of the 183 graduates and 197 dropouts. Of these 380 Ss, 208 were in regular classes and 172 were in special classes for the educable mentally retarded. "The individual reading tests surpass individual intelligence tests in ability to predict successful graduation from regular school classes for low-achieving students. Verbal IQ has moderate value as a predictor of ability to graduate in regular classes, but Performance IQ is practically worthless for this purpose."—*H. Kaczowski.*

1871. **Spiegel, Don & Keith-Spiegel, Patricia.** (Veterans Administration Center, Los Angeles, Calif.) **Multiple predictors of course grades for college men and women.** *Journal of College Student Personnel*, 1971(Jan), Vol. 12(1), 44-48.—Investigated the relationship between intellectual, attitudinal, and personality variables and academic success for 76 college students (45 male, 31 female) by using a stepwise multiple regression method. The tests and scales used were the MA scale, the Custodial Mental Illness Ideology Scale, the California F Scale, the 15-item short form of the Over-all Agreement Scale, the Dogmatism Scale, the Security-Insecurity Inventory, the Internal-External Control Scale, the Institute of Living Scale Vocabulary and Abstractions subtests, the Picture Differences Test, and the Spiegel Personality Inventory. Results indicate that grade points were best predicted by a different combination of variables for males and females. Support is provided for the notion that personality and attitude information may be useful in combination with intellectual factors in predicting achievement in at least some academic settings. (22 ref.)—*R. H. Mueller.*

1872. **Stroup, Atlee L. & Eft, John H.** (Coll. of Wooster) **The CPI as a predictor of college academic success.** *Alberta Journal of Educational Research*, 1969(Dec), Vol. 15(4), 191-194.—Administered the CPI to 1938 college freshmen during the 1st wk. of school. Ss' GPAs at the end of the 1st semester and the 1st yr. were then correlated with the CPI scales. Results show that 9 scales correlated significantly for females and 11 for males. Responsibility and achievement via independence

were most highly correlated, and in both cases the correlation was higher for males. Socialization, tolerance, achievement via conformity, and intellectual efficiency were also highly correlated with GPA for both sexes.—*M. Maney.*

Overachievement & Underachievement

1873. **Fisher, Robert J. & Wass, Hannelore.** (Eastern Michigan U.) **What price excellence?** *College Student Survey*, 1970(Win), Vol. 4(3), 89-92.—It has been common knowledge that frequently children with high educational achievement in the elementary grades later become mediocre performers. Research has indicated that high achievers frequently have personality characteristics assigned to low achievers. 4th-8th graders were grouped on factors of self-esteem, value orientation, perceptions of the teachers and learning conditions, mental health aspects, and peer relationships. 3 groups of clusters were identified: high, low, and mixed achievers. In the mixed group both high and low achievers regarded themselves unfavorably, lacked motivation, had low values on education, and unfavorably perceived the teachers, their peers, and the emotional climate of the classroom. Ss' self-esteem decreased with upward progress irrespective of academic achievement. Apparently, "academic excellence does not preclude a pupil's need for help in the personal-social aspects of his functioning." It is concluded that the overemphasis on achievement may be at the expense of the student's self-esteem and value orientation.—*A. J. Ter Keurst.*

1874. **Srivastava, Akhilesh K.** (Patna Coll., India) **Reading ability and underachievement.** *Indian Educational Review*, 1969(Jan), Vol. 4(1), 116-122.—Attempted to discover whether reading ability is related to underachievement. The sample was comprised of 4 groups of 150 boys, each representing the 4 categories of achievers—under, over, high, and low. 3 reading tests, measuring speed, vocabulary and spelling, were administered to all Ss. It was found that reading ability, which correlated significantly with achievement, emerged as a factor related to the differential achievement patterns of these groups. (20 ref.)—*Journal abstract.*

CURRICULUM & PROGRAMS

1875. ———. **Vocational exploration for city youth.** *Science Teacher*, 1969(Dec), Vol. 36(9), 30-31.—Outlines 3 programs designed to acquaint urban youth with career opportunities in technical areas. 2 programs emphasize actual technical training and employment during high school for Negro urban students.

1876. **Allen, K. Eileen; Turner, Keith D., & Everett, Paulette M.** (U. Washington, Child Development & Mental Retardation Center) **A behavior modification classroom for Head Start children with problem behaviors.** *Exceptional Children*, 1970(Oct), Vol. 37(2), 119-127.—Applied behavior modification techniques to 12-15 children with problem behaviors enrolled in a demonstration Head Start class. The goals of the demonstration project were: (a) to provide remedial services, (b) to provide Head Start teachers and related personnel with in-service training in behavior modification techniques, and (c) to conduct applied research based on the behavioral analyses of Teacher \times Child interactions. 2 case studies are presented of an aggres-

sively disruptive child and a child whose total behavioral repertoire consisted of bizarre and maladaptive behaviors.—*Journal abstract.*

1877. Bereiter, Carl. (Ontario Inst. for Studies in Education, Toronto, Canada) **Designing programs for classroom use.** In F. F. Korten, S. W. Cook, & J. I. Lacey (Eds.), "Psychology and the problems of society." (See PA, Vol. 46:Issue 1) 204-207.

1878. Bono, James D. (Miami U.) **Languages, humanities and the teaching of values.** *Modern Language Journal*, 1970(May), Vol. 54(5), 335-347. —Attempts to "diagnose the failure of language and humanities classes in the secondary schools." The goals for instruction in the secondary schools are confused because of the tendency for American educational thinking to center on the teaching of values. Values are practically unteachable, yet truly educational goals are sacrificed for the sake of an orientation toward values. The result is very low educational standards and a dilettantism in education in which students do not master any discipline. The high rate of attrition in the languages is a salient example. Good students cannot develop properly because of the comprehensive high school and its emphasis on leveling. The real goal of education, the development of an intellectual approach to life, is missed. This compares unfavorably to the situation in European schools. Some practical suggestions are presented for improvement, which emphasizes the need for establishing sequential programs.—S. R. Diamond.

1879. Clark, Kenneth B. (City Coll., City U. New York) **Alternatives to urban public schools.** In F. F. Korten, S. W. Cook, & J. I. Lacey (Eds.), "Psychology and the problems of society." (See PA, Vol. 46:Issue 1) 115-120.

1880. Dreyer, Albert S. & Rigler, David. (U. Connecticut) **Cognitive performance in Montessori and nursery school children.** *Journal of Educational Research*, 1969(May), Vol. 62(9), 411-416.—Measured cognitive performance in 14 pairs of children, matched in social class, CA, sex, and IQ, selected from a Montessori and from a "traditional" nursery school. No differences were found between the parents in these schools on measures of social and parental attitudes and behavior, e.g., achievement orientation, traditional family ideology, dogmatism, anomie, parental control behavior, or task oriented vs. person oriented values. The nursery school Ss were significantly more creative on a measure of nonverbal creativity, were more socially oriented, and less task oriented than the Montessori Ss. Style of approach to tests was felt to be a critical outcome of the approach to tests was felt to be a critical outcome of the 2 educational environments. The Montessori Ss used significantly more physical characteristics to describe commonplace objects, whereas significantly more functional terms were used by the nursery school Ss in their descriptions. Montessori Ss' drawings had people present significantly less often and geometric forms significantly more often than the nursery school Ss' drawings. (27 ref.)—*Journal abstract.*

1881. Fine, Marvin J. (U. Kansas, School of Education) **Some qualifying notes on the development and implementation of behavior modification programs.** *Journal of School Psychology*, 1970, Vol. 8(4), 301-305.—Reviews 3 aspects of program planning in terms of the value issues involved. These include the manipulation of both antecedent and consequent events to the behavior, the inclusion of the child in program

planning, and teacher resistance to the program. (15 ref.)—*Journal abstract.*

1882. Gray, Susan W. & Klaus, Rupert A. (George Peabody Coll for Teachers) **The early training project: A seventh-year report.** *Child Development*, 1970(Dec), Vol. 41(4), 909-924.—Reports findings at the end of the 4th grade, 3 yr. after all experimental intervention had ceased at a preschool intervention project for children from low-income homes designed to investigate whether progressive retardation could be offset in elementary school. Special experiences provided for the 44 experimental children were based upon variables associated with attitudes and aptitudes conducive to school achievement. The Stanford-Binet, the Peabody Picture Vocabulary Test, and the Metropolitan Achievement Test were used as measures. Intensive work was done for 3 summers; in the remaining months there were weekly home visits. Over the years experimental Ss remained significantly superior to the 44 controls on intelligence tests. On measures of language and achievement, trends still remained, but differences were no longer significant by the end of 4th grade. There was a slight but parallel decline across groups. Evidence is presented on younger siblings.—*Journal abstract.*

1883. Grieger, Russell N., Mordock, John B., & Breyer, Norman. (Ohio State U.) **General guidelines for conducting behavior modification programs in public school settings.** *Journal of School Psychology*, 1970, Vol. 8(4), 259-266. Presents tentative guidelines for initiating behavior modification programs. Discussion focuses on (a) the importance of initial introduction of these procedures to teachers, (b) the relation of teacher personality variables to technique selection, (c) factors to consider when evaluating children for modification, and (d) suggestions for on-going participation and withdrawal of the psychologist as an active agent in such programs. (45 ref.)—*Journal abstract.*

1884. Heaps, Richard A. (U. Utah) **Self- and physical fitness attitudes following a contrived fitness test.** *Dissertation Abstracts International*, 1970(Oct), Vol. 31(4-B), 2255.

1885. Karnes, Merle B., Teska, James A., Hodgins, Audrey S., & Badger, Earledeen D. (U. Illinois) **Educational intervention at home by mothers of disadvantaged infants.** *Child Development*, 1970(Dec), Vol. 41(4), 925-935. Describes a program of early educational intervention implemented by 20 mothers over a 15-mo period to prevent the developmental deficiencies characteristic of disadvantaged children by the age of 3 or 4. Postintervention scores on the Stanford-Binet Intelligence Scale and the Illinois Test of Psycholinguistic Abilities of the 15 13-27 mo. old children whose mothers completed the program are compared with the performances of 15 children of similar family backgrounds who received no intervention. Also the scores of 6 experimental children are compared with those obtained by their siblings prior to the mothers' enrollment in the training program. The performances of experimental children were significantly superior to those of both control groups.—*Journal abstract.*

1886. Kessen, William. (Yale U.) **Early learning and compensatory education: Contributions of basic research.** In F. F. Korten, S. W. Cook, & J. I. Lacey (Eds.), "Psychology and the problems of society." (See PA, Vol. 46:Issue 1) 200-203.

1887. Lamb, Douglas H. (Florida State U.) **The effects of public speaking of self-report, physio-**

logical, and behavioral measures of anxiety. *Dissertation Abstracts International*, 1970(Oct), Vol. 31(4-B), 2284.

1888. Lipton, Edward D. (Madison Coll.) **A perceptual-motor development program's effect on visual perception and reading readiness of first-grade children.** *Research Quarterly*, 1970(Oct), Vol. 41(3), 402-405.—Reports on a program in perceptual-motor development and determines changes in, and assesses relationships between, changes in perceptual-motor development on visual perception and reading readiness of 92 1st grade children. 4 classes were equated on the variables age, height, sex, and weight. 2 of the classes (experimental) were exposed to the perceptual-motor program for 12 wk. and the other 2 classes (control) took part in the conventional physical education program. All students participated in their regular classroom activities. All Ss were evaluated in perceptual-motor development, visual perception, and reading readiness prior to and immediately following the program. F ratios for the 3 variables tested were all significant beyond the .01 level in support of the perceptual-motor program.—*Journal abstract*.

1889. Losen, Stuart. (Public Schools, New Canaan, Conn.) **The Special Services Aide in the schools: A new approach to an old problem.** *Psychology in the Schools*, 1970, Vol. 7(4), 392-396.—Describes the use of 8 volunteer mothers from the community who functioned as Special Service Aides in the New Canaan, Connecticut, school system. The primary functions and limitations as listed by the aides were observing, tutoring, counseling, testing, and community liaison. Active supervision by teachers and a Special Service staff is considered the key to the success of the program.—*H. Kaczkowski*.

1890. Lyman, Bernard. (Simon Fraser U., Burnaby, British Columbia, Canada) **Performance of introductory psychology students in an Historical Foundations course in an Historical Foundations and a standard introductory final examination.** *Journal of the History of the Behavioral Sciences*, 1970(Oct), Vol. 6(4), 354-357.—The performances of 592 students, mostly 1st-semester freshmen, taking a problem-oriented Historical Foundations introductory psychology course were compared on a specially designed final examination and a final examination designed for a "standard" introductory course. The ensuing data suggest that students taking such a Historical Foundations course do as well in examinations designed for "standard" introductory courses as in an examination specially designed for this course. It is further concluded that "the Historical Foundations introductory course is at least as broad as the customary introductory psychology course."—*C. M. Franks*.

1891. McFadden, Hugh B. & Pasewark, Richard A. (U. Wyoming) **High school psychology in the Rocky Mountain region.** *Journal of School Psychology*, 1970, Vol. 8(4), 306-310.—Over 40% of the high schools in a 5-state Rocky Mountain region reported offering courses in psychology. A significant portion of students entering college classes have had such courses. With but 15% of teachers claiming a major in psychology and the rest scattered through 20-some other subjects, adequacy of teacher preparation is questioned. Areas for effort are suggested to enhance teacher preparation and to develop high school courses which might be appropriate to advanced placement or enriched introductory study at the college level. These developments should have added

benefits for psychology's recruitment efforts and the spread of public knowledge about psychology.—*Journal abstract*.

1892. Messick, Samuel. (Educational Testing Service, Princeton, N.J.) **Evaluation of educational programs as research on the educational process.** In F. F. Korten, S. W. Cook, & J. I. Lacey (Eds.), "Psychology and the problems of society." (See PA, Vol. 46:Issue 1) 215-220.

1893. Miller, James O. (U. Illinois) **Disadvantaged families: Despair to hope.** In F. F. Korten, S. W. Cook, & J. I. Lacey (Eds.), "Psychology and the problems of society." (See PA, Vol. 46:Issue 1) 179-197.

1895. Morrisett, Lloyd N. **Early learning and compensatory education.** In F. F. Korten, S. W. Cook, & J. I. Lacey (Eds.), "Psychology and the problems of society." (See PA, Vol. 46:Issue 1) 198-199.

1896. Pettigrew, Thomas F. (Harvard U.) **The metropolitan educational park.** In F. F. Korten, S. W. Cook, & J. I. Lacey (Eds.), "Psychology and the problems of society." (See PA, Vol. 46:Issue 1) 133-139.

1897. Pyecha, John. (Research Triangle Inst., Research Triangle Park, N.C.) **Comparative effects of judo and selected physical education activities on male university freshman personality traits.** *Research Quarterly*, 1970(Oct), Vol. 41(3), 425-431.—Compared the effects of physical education courses in Judo I and II, handball, badminton, basketball, and volleyball on certain personality traits of male college freshmen. Ss used were randomly selected and assigned to the experimental (Judo I and II, N = 73), Control 1 (handball and volleyball, N = 34), and Control 2 (badminton and basketball, N = 42) groups. Personality trait measures on all Ss were obtained through repeated administrations of 16 PF, 1962 Edition of Form A; i.e., pretreatment, 8- and 16-wk measures. Using pretreatment measures as covariates, analysis of variance techniques indicates that the judo experimental group became more warmhearted, easygoing, and participating than did either of the control groups. *Journal abstract*.

1898. Schlungs, M. (U. Liège, Inst. of Psychology & Science of Education, Belgium) **L'influence du milieux pédagogique et sportif sur le développement de l'enfant.** [Influence of pedagogic and sportive half-times on child development.] *Bulletin de Psychologie Scolaire et d'Orientation*, 1970(Jun), Vol. 19(2), 88-90.—Suggests an almost even division of school time between intellectual activities (in the morning) and physical education (in the afternoon) and its influence on the intellectual and physical development of children is discussed, based on the previous experiences in France. The new experimental schedule assigned 19½ hr/wk to intellectual class work and 7½ hr/wk to physical culture, in comparison with the 26½ and 3½ hr/wk, respectively, which are standard in French schools. Results are definitely positive. Much higher passing grades were earned by the children studying under the new schedule, and the children were more relaxed, balanced, assiduous, and concentrated at home and school. It is concluded that this method is applicable to all school levels, and is recommended for a long and healthy psychosomatic evolution, both physiologically and intellectually.—*P. von Toal*.

1899. Sontag, Marvin; Sella, Adina P., & Thorndike,

Robert L. (Teachers Coll., Columbia U.) **The effect of Head Start training on the cognitive growth of disadvantaged children.** *Journal of Educational Research*, 1969(May), Vol. 62(9), 387-389.—Measured the effects of Head Start on the cognitive development of preschool children by comparing 43 pairs of Head Start children with children of similar ages who were registered for Head Start but had not begun the program. The assumption made in the selection of the latter group for comparison purposes, was that the family background and other variables that make for a particular child being enrolled in this voluntary program would be controlled. Ss were given the Stanford-Binet Intelligence Test and the Caldwell-Soule Preschool Inventory (CSPI). No significant differences ($p > .05$) in IQ were found. Significant differences (approximately $\frac{1}{2}$ of a standard deviation) were found on the CSPI.—*Journal abstract*.

1900. Spano, Bartolo J. (U. Florida) **Casual thinking, adjustment and social perception as a function of behavioral science concepts in elementary school children.** *Dissertation Abstracts International*, 1970(Nov), Vol. 31(5-B), 3009-3010.

1901. Stephenson, Richard W. (Public Schools, New Canaan, Conn.) **Community involvement in the Special Services Aide program: A key to more effective service.** *Psychology in the Schools*, 1970, Vol. 7(4), 386-392.—Reviews the development of a Special Service Aide program in the New Canaan, Connecticut, school system.—H. Kaczkowski.

1902. Stern, Carolyn & Bryson, Juanita. (U. California, Los Angeles) **Competence versus performance in young children's use of adjectival comparatives.** *Child Development*, 1970(Dec), Vol. 41(4), 1197-1201.—Attempted to determine whether disadvantaged preschoolers can be taught to produce comparatives. 12 50-60 mo. old children (previously given the Peabody Picture Vocabulary Test) were given 3 12-min programed lessons using rule-given vs. echoic instructional treatments. Each of 10 paired pictures presented an adjective and its comparative (e.g., fat pig, fatter pig). The criteria included a selection and a labeling task. The mean score on the selection pretest was over 85%; on the labeling the score was less than 10%. After training, both treatments made significant gains (.01 level), scoring 85% or better on the labeling posttest. This gain was retained over a 6-mo period.—*Journal abstract*.

1903. Willmon, Betty. (Florida State U.) **Parent participation as a factor in the effectiveness of Head Start programs.** *Journal of Educational Research*, 1969(May), Vol. 62(9), 406-410.—Investigated the effects of parental participation in a Head Start program on the academic achievement of students as measured by the Metropolitan Reading Readiness Test. Ss were 485 Negro children and 56 white children of similar mental ability and socioeconomic background living in Florida. Ss were divided into 3 groups according to parental participation and involvement in the program. The mean participation readiness score of the active parental participation group was higher than that of the no parental participation group ($p > .05$). The mean reading readiness score of the highly active group was higher than that of the no parental participation group ($p > .01$). Findings indicate that for this population the influence of highly active parental involvement in Head Start appeared to serve as an intervening variable which influenced academic motivation. (16 ref.)—*Journal abstract*.

1904. Young, Jay A. (Carleton Coll., Ottawa, Ontario,

Canada) **Behavioral definitions of "understand" and "think."** *Science Teacher*, 1969(Nov), Vol. 36(8), 59-60.—Outlines behavioral educational objectives for secondary school and undergraduate education, i.e., that each student: (a) demonstrate understanding of his major field and related fields; (b) seek to teach himself and achieve understanding of voluntarily chosen topics; and (c) display an ability to see relationships, draw inferences, and generate hypotheses as parts of the larger process of thinking.—P. Zell.

Teaching Methods & Teaching Aids

1905. Boiarsky, Carolyn. (Southwest Regional Lab., Los Angeles, Calif.) **Updating education in Appalachia.** *Audiovisual Instruction*, 1968(Dec), Vol. 13(10), 1096-1098.—Describes a network of educational cooperatives, employing the communications media, which are being designed by the Appalachia Educational Laboratory to solve the problems of inadequate facilities, personnel, and curricula facing Appalachian schools. The use of TV and radio telelecture would link the local schools to a central facility from which relevant and comprehensive programs would emanate, and mobile facilities would carry special equipment and personnel to the schools.—P. McMillan.

1906. Dwyer, Francis M. (Pennsylvania State U., Div. of Instructional Services) **Effect of knowledge of objectives on visualized instruction.** *Journal of Psychology*, 1971(Mar), Vol. 77(2), 219-221. Investigated the relative effectiveness of 8 types of visual illustrations used to complement programed instruction when Ss, prior to receiving the instruction, were told specifically the types of information they were expected to obtain from the instruction. 295 undergraduates were randomly assigned to 1 of 9 treatment groups. Each S received the Otis Quick Scoring Mental Ability Test (Form FM), participated in his respective instructional presentation, and received 4 individual criterion measures. Results indicate (a) all types of visuals are not equally effective in facilitating S achievement of different learning objectives, and (b) the use of specific instructions to focus Ss' attention on relevant learning cues in the more realistic illustrations is not an effective instructional technique for increasing S achievement.—*Author abstract*.

1907. Forness, Steven R. (U. California, Los Angeles) **Behavioristic approach to classroom management and motivation.** *Psychology in the Schools*, 1970, Vol. 7(4), 356-363. Reviews behavior modification strategies that have direct application in the classroom, e.g., classroom reinforcements, teacher attention, high frequency behaviors used to reinforce low frequency behaviors, teacher as researcher, and desensitization. (22 ref.)—H. Kaczkowski.

1908. Gaasholt, Marie. (U. Oregon) **Precision techniques in the management of teacher and child behaviors.** *Exceptional Children*, 1970(Oct), Vol. 37(2), 129-135. Presents a practical method of evaluating teaching skills through precision teaching techniques. Specific topics include (a) measuring teacher contacts with various pupils, (b) measuring the effects of teacher behavior on pupil performance, and (c) establishing proficiency levels in writing and arithmetic. Examples of the techniques and procedures are described in the teaching of 25 children referred to an experimental school for behavior problems and academic underachievement.—*Journal abstract*.

1909. Grotelueschen, Arden. (U. Illinois, Center for Instructional Research & Curriculum Evaluation) **Structure and sequence in teaching number bases to adults.** *Adult Educational*, 1970(Sum), Vol. 20(4), 195-205.—Studied the effects of differentially structured introductory materials on conceptually related learning tasks which were differentially sequenced. 96 23-53 yr. old Ss unfamiliar with number bases were randomly assigned to 4 introductory material (history of measurement, Base 10, Base 7, or principles of number bases) and 3 learning task (random, partial, or complete) conditions within 4 intelligence and 2 sex categories. Ss were individually presented the Base 4 task in paired associate form after they had received the programmed introductory material. The effect of the introductory material appeared to be greater for Ss with superior intelligence. The completely sequenced learning task resulted in a more rapid acquisition of the learning task. Reliable differences among the intelligence categories and between sexes were also observed. Findings suggest that the complexity of the learning topic is a variable to consider in ascertaining the extent to which introductory materials facilitate learning.—*Journal summary*.

1910. Hansen, Duncan N. & O'Neill, Harold F. (Florida State U.) **Empirical investigations versus anecdotal observations concerning anxiety in computer-assisted instruction.** *Journal of School Psychology*, 1970, Vol. 8(4), 315-316.—Offers empirical data gathered from systolic blood pressure and A-State scale scores of the State-Trait Anxiety Inventory as counter evidence to the negative criticisms of computer-assisted instruction systems as anxiety producing situations.—*Journal abstract*.

1911. Harris, Larry A. (Indiana U.) **Interest and the initial acquisition of words.** *Reading Teacher*, 1969(Jan), Vol. 22(4), 312-314, 362.—Learning research supports the effects which have been made in developing reading materials of high interest. If individual words selected on the basis of their appeal were found to be acquired and retained more readily than other words, a strong case for their inclusion in reading materials could be made. The study found, however, that interest loading of words is unrelated to acquisition among low socioeconomic children. Kindergarten children from low economic status facilities do not retain for even a short time words which they have acquired. Interest loading was not demonstrated to be important in the acquisition and retention of words by low socioeconomic kindergarten children.—*P. D. Leedy*.

1912. Hauserman, Norma N. (U. Maryland) **The effects of fading and shaping techniques and concrete reinforcement in acquisition of early reading behaviors in primary grade high-risk reading failures.** *Dissertation Abstracts International*, 1970(Nov), Vol. 31(5-B), 3024.

1913. Havighurst, Robert J. (U. Chicago) **Minority subcultures and the law of effect.** In F. F. Korten, S. W. Cook, & J. I. Lacey (Eds.), "Psychology and the problems of society." (See PA, Vol. 46:Issue 1) 275-288.

1914. Hunkins, Francis P. (U. Washington) **Effects of analysis and evaluation questions on various levels of achievement.** *Journal of Experimental Education*, 1969(Win), Vol. 38(2), 45-58.—Investigated whether a dominant use of analysis and evaluation questions in social studies text-type materials would improve various levels of 6th grader's social studies achievement. 260 6th grade pupils in 11 classes were randomly assigned by

class to either experimental Condition A or B. During a 4-wk experimental period, pupils in each condition used specially prepared materials. Condition A's materials contained a dominant emphasis of analysis and evaluation questions (47.53%), while Condition B's materials utilized primarily knowledge questions (87.38%). At the experiment's termination, an achievement test was administered that provided 6 subscores, 1 for each level of B. S. Bloom's taxonomy of educational objectives. Analysis of covariance was the principal method of analysis. Students in Condition A achieved significantly better in the area of evaluation than did students in Condition B. Reading significantly affected all subscores with better readers performing at higher levels than poorer readers. The use of analysis and evaluation questions produced significantly greater scores in the area of evaluation than did the use of knowledge questions. Better readers in both conditions achieved significantly higher than did poorer readers in all 6 areas of the achievement test.—*Journal abstract*.

1915. Jones, Rodney M. & Hick, Thomas L. (State U. New York, Child Study Center, New Paltz) **Two sequence factors in programmed instruction.** *Journal of Experimental Education*, 1969(Win), Vol. 38(2), 66-69.—Tested pupil performances due to variation of step size (texture) and block size in programmed instruction in a 2-factor (3 × 3) experimental design. A 60-item addition drill was prepared in 3 different sequences of item difficulty and each sequence was presented via computer in 3 different block sizes (15, 30, and 60 items block). 36 bright 8th graders were randomly assigned to the resulting 9 sequences. Analysis of variance of posttest performance data based on response latency showed no significant differences due to texture, block size, or interaction. Control of performance data for initial differences in ability did not significantly improve experimental precision.—*Journal abstract*.

1917. Mollod, Ruth W. (Columbia U.) **Pupil-tutoring as part of reading instruction in the elementary grades.** *Dissertation Abstracts International*, 1970(Oct), Vol. 31(4-B), 2260-2261.

1918. Paige, Joseph C. (Federal City Coll., Washington, D.C.) **Problems in teaching science to the urban child.** *Science Teacher*, 1969(Oct), Vol. 36(7), 27-32.—Hypothesized that (a) the domination of the decision hierarchy, (b) teacher education programs, and (c) profit orientation of the textbook publishers and resulting inferior textbook content used as the sole basis of instruction are the major obstacles encountered in teaching science to urban children. It is suggested that the weaknesses of the educational establishment present a greater problem than the child's cultural disadvantage. An instructional strategy is proposed, composed of 7 strata based on process. Stratum I—symbol and meanings—consists of theoretical and qualitative symbols in 4 educational situations. These symbols are perceived in Stratum II, which delineates cultural determinants of perception. Stratum III classifies the modalities of the inference process. The memory function, Stratum IV, based on neurological, biochemical, and electrochemical factors, is combined with the former 3 strata to determine cognitive style or

Stratum V. In reaction to the various cognitive styles, Stratum VI outlines teaching, administrative, and counseling styles to be adapted to the individual student's needs. Stratum VII consists of systems analysis and decision making to provide feedback on the effectiveness of the educational system.—P. Zell.

1919. Suppes, Patrick & Morningstar, Mona. (Stanford U., Inst. for Mathematical Studies in the Social Sciences) **Technological Innovations: Computer-assisted instruction and compensatory education.** In F. F. Korten, S. W. Cook, & J. I. Lacey (Eds.), "Psychology and the problems of society." (See PA, Vol. 46:Issue 1) 221-236.

1920. Taylor, Norman P. (Jackson Public Schools, Mich.) **Science among the bricks and mortar: Reaching the inner-city child.** *Science Teacher*, 1969(Dec), Vol. 36(9), 27-28.—Proposes that approaches to the teaching of science to inner-city children should be dependent upon the degree of cultural disadvantage and ego damage suffered by the child. To prevent further frustration, the teacher should create a climate of activity-orienting learning, with emphasis on rewarding success and ignoring failure. Principles of operant conditioning and assistance of trained teachers' aides are suggested to stimulate and maintain maximum attention and interest.—P. Zell.

PERSONNEL & INDUSTRIAL PSYCHOLOGY

1921. Borgen, Frederick H. (U. Minnesota) **Taxonomic analysis of occupational environments: A comparison of two grouping methods.** *Dissertation Abstracts International*, 1970(Nov), Vol. 31(5-B), 2951-2952.

1922. Hall, Douglas T. (Yale U.) **A theoretical model of career subidentity development in organizational settings.** *Organizational Behavior & Human Performance*, 1971(Jan), Vol. 6(1), 50-76.—Presents a framework of psychological and sociological research on careers, and a model for describing a phenomenon largely unexplored in the psychological career literature—identity changes during the course of a person's occupational career experiences. In this model the individual's total identity is viewed as a number of subidentities, with each subidentity representing the person's image of himself in a particular social role. The model examines the development of the career subidentity, the person's conception of himself in his career role. Growth in the career subidentity and career commitment is seen as a series of cycles of challenging goal setting, independent effort, success, subidentity growth, and increased career self-esteem and commitment, leading to further goal setting. (71 ref.) —Journal abstract.

1923. Karnes, Edward W., Thomas, J. Kirby, & Loudis, Leonard A. (Martin Marietta Corp., Denver, Colo.) **Recreational preferences in potential space crew populations.** *Human Factors*, 1971(Feb), Vol. 13(1), 51-58.—Surveyed leisure-time preferences in 3 populations which are potential sources for future space crews. A questionnaire designed to provide rating space measures of preferences for various spacecraft recreational equipment items, leisure-time activity cat-

egories, content within activity categories, and various kinds of snack items, was administered to 44 test pilots, 37 military pilots, and 53 aerospace engineers and scientists. Statistical analyses of the obtained data indicate that preferences for types of spacecraft leisure-time equipment were similar in the 3 populations. However, certain significant differences were obtained among the populations in terms of the amount of time spent in earthbound leisure-time activities. Implications for space mission off-duty concepts are discussed. —Journal abstract.

1924. Singh, Narayan P. (Bhagalpur U., India) **Risk taking, achievement imagery, and personnel functions in entrepreneurship: A psychological analysis.** *Indian Journal of Psychology*, 1970(Jun), Vol. 45(2), 121-139.—Discusses the psychology of the entrepreneur. 3 aspects are considered: awareness of the risks to be taken, the motivation factor, and the personnel function in entrepreneurship. The entrepreneur resembles the gambler, but the entrepreneur does not invest more than he can afford, learns from defeats, and is able to stop when the proper time comes. The approach to investing varies individually: (a) the "non-gambling" type stops after having made a sufficient fortune, (b) the "small speculator" takes small risks, and usually sustains cumulative losses; and (c) the "big speculator" takes great risks with provisions, e.g. avoidance of instabilities and of social disgrace. An entrepreneur is driven by a desire to achieve success and not to fail in business. He is motivated with a "3 stages motivational intensity: wish fulfillment, push toward reality, and defense." Personnel functioning in entrepreneurship should be of a "thrusting" and not of a "sleeping" type. It is suggested that (a) provisions should be made for an effective management, for a broad assessment of the firm and its future, and (b) regular control of the firm should be exercised and attention paid to research and development. —Haley.

VOCATIONAL CHOICE & GUIDANCE

1925. Johansson, Charles B. & Campbell, David P. (Macalester Coll.) **Stability of the Strong Vocational Interest Blank for men.** *Journal of Applied Psychology*, 1971(Feb), Vol. 55(1), 34-37. Inspection of test-retest reliability studies for the SVIB revealed that 2 factors were important when considering the stability of this instrument. Ss' initial test ages and length of test-retest intervals. To further investigate these 2 factors, median test-retest correlation coefficients were computed for over 1400 college educated males who had been tested with the SVIB at various ages and retested at varying intervals. Greater stability resulted the older the S at initial testing and the shorter the time lapse to retesting. —Journal abstract.

1926. Johnson, Richard W. (U. Wisconsin, Counseling Center) **Comparability of old and revised forms of the Strong Vocational Interest Blank for Women.** *Journal of Applied Psychology*, 1971(Feb), Vol. 55(1), 50-56.—Administered the old and revised forms of the SVIB for Women (W) to a volunteer sample of 124 female Ss aged 15-66 yr. old. The scores on the 29 occupational scales common to both forms of the SVIB-W were highly related (Median $r = .83$) for most of the scales. The level of scoring on some of the scales changed markedly, however, largely dependent upon the year of sampling of the original occupational group members. Because of the

latter, correlations between individual profiles for the 2 forms were only moderately high (Median $r=.71$). Conclusions based upon profile analyses of the old form should not be generalized to the new form. A short form of the Basic Interest Scales, scorable on the old SVIB-W, may serve as a bridge between the old and new SVIB-W for use in longitudinal research projects.—*Journal abstract.*

SELECTION & PLACEMENT

1927. Bayroff, Abram G. & Fuchs, Edmund F. **The Armed Services Vocational Aptitude Battery.** U. S. Army BESRL Technical Research Report, 1970(Feb), No. 1161, 40 p.—Research was undertaken to develop a common aptitude battery for use by all the armed services as well as to provide an overall measure for the Armed Forces Qualification Test (AFQT). The Army and the Behavioral Science Research Laboratory, as lead service, participated with the Navy, Air Force, and Marine Corps in a study to determine comparability of the classification tests used by the several services and, from those tests found to be interchangeable, to develop shortened forms to constitute an alternate interservice battery. The new battery derived (Armed Services Vocational Aptitude Battery—ASVAB) was standardized on a 3000-man sample of Selective Service registrants, again stratified on AFQT. 7 sets of tests were identified as interchangeable: Word Knowledge, Arithmetic Reasoning, Space Perception, Mechanical Comprehension, Shop Information, Automotive Information, and Electronics Information. The Army Coding Speed Test was selected as a measure of clerical aptitude on the basis of separate validity studies. An 8th test, Tool Knowledge, was added to provide AFQT scores. The ASVAB tests, currently in use to test potential recruits in their senior year of high school, may also be used as service classification batteries, supplemented as needed by tests unique to a given service.—A. J. Drucker.

1928. Carlson, Robert E. (Life Insurance Agency Management Assn., Hartford, Conn.) **Effect of interview information in altering valid impressions.** *Journal of Applied Psychology*, 1971(Feb), Vol. 55(1), 66-72.—Presents the results of a study extending some of the variables of impression formation to a simulated employment interview setting. Life insurance agency managers evaluated 8 hypothetical job applicants 9 different times based on 9 different sets of information varying in favorability. 3 treatment conditions appear to have affected interviewers' evaluations: (a) valid test results (14%), (b) favorability of subjective personal history (12%), and (c) a combination of different types and amounts of information (11%). A primacy effect was found for unfavorable but not favorable information; unfavorable information had a recency effect when presented with favorable. Thus, the effect of subjective interview information in altering valid impressions is dependent on the amount, kind, and order in which it is presented. (30 ref.)—*Journal abstract.*

1930. Larson, Emilie E. & Kristiansen, Donald M. **Prediction of disciplinary offense early in Army service.** U. S. Army BESRL Technical Research Note, 1969(Apr), No. 210, 16 p.—Attempted to determine the

effectiveness of a written instrument to identify persons likely to become offenders early in Army service. Focus was on the disciplinary record during initial training, approximately the 1st 16 wk. of military service. Of special interest was the possibility of predicting disciplinary offenses among the low mental ability men admitted to the Army under the new lower standards. 3 measures derived from the Personal Opinion Study and an Overall Acceptability measure representing the best written predictor of Army disciplinary record resultant from previous research were obtained for a large sample of men tested at Reception Stations. The findings, together with similar conclusions on earlier disciplinary prediction research, should discourage efforts to predict disciplinary offenses on the basis of individual characteristics on entry to military service. The most effective predictor, the Overall Acceptability measure, would screen out an undue number of nonoffenders in order to identify a small number of potential early offenders.—A. J. Drucker.

TRAINING

1933. Baldwin, Thomas S. & Bailey, Larry J. (U. Illinois) **Readability of technical training materials presented on microfiche versus offset copy.** *Journal of Applied Psychology*, 1971(Feb), Vol. 55(1), 37-41.—Attempted to develop psychometric instruments of known reliability and content validity for measuring an individual's ability to process each of several types of information through the visual modality, and to conduct an experimental study in which the instruments developed were used as the dependent variable. 12 reading tests were constructed using each of 4 types of technical training materials. 3 forms of each test master were reproduced: offset copy, positive image microfiche, and negative image microfiche. Men in the Air Force served as Ss. A control group received the offset copy form, and positive and negative image forms were administered to the 2 experimental groups (N=45, 43, and 45, respectively). An analysis of variance revealed statistically significant differences in favor of offset copy for 3 of the 12 subtests.—*Journal abstract.*

1934. Hellebrandt, E. T. & Stinson, John E. (Ohio U., Div. of Research) **The effects of T-group training on business game results.** *Journal of Psychology*, 1971(Mar), Vol. 77(2), 271-272.—Studied the impact of laboratory training in intact groups and fragmented groups on the operating effectiveness and cohesiveness of 5 man companies participating in a business game. Ss were 75 seniors and graduate students who participated in the business game as a part of a regular course. 5 companies (25 Ss) participated in laboratory training as intact work groups, 5 as fragmented groups, and 5 served as controls. Business game performance indicates that

intact trained groups were significantly more cohesive and significantly less effective in operations than fragmented trained groups.—*Author abstract.*

TASK & WORK ANALYSIS

1936. Eschenbrenner, A. John. (McDonnell Douglas Corp., St. Louis, Mo.) **Effects of intermittent noise on the performance of a complex psychomotor task.** *Human Factors*, 1971(Feb), Vol. 13(1), 59-63.—Investigated manual image-motion compensation, a complex psychomotor task involved in certain photographic activities from orbit, as a function of the temporal pattern (aperiodic, periodic, or continuous) and intensity level (50, 70, or 90 db.) of white noise. Ss were 24 male aircraft engineers and engineering students. Performance was measured in terms of the total amount of time image motion was held at or below a 40-microadians/sec criterion for specific blocks of trials. Results show that white noise had a detrimental effect on image motion compensation performance, and that the magnitude of the decrement varied as a function of both the temporal pattern and intensity level of this noise.—*Journal abstract.*

1937. Fogli, Lawrence; Hulin, Charles L., & Blood, Milton R. (U. California, Berkeley) **Development of first-level behavioral job criteria.** *Journal of Applied Psychology*, 1971(Feb), Vol. 55(1), 3-8.—Carried out a procedure for the development of behaviorally anchored rating scales in order to establish reliable job criteria for grocery clerks. Examples of checker behavior were obtained by interviewing staff personnel of a large Western grocery chain. Dimensions of the job were defined, and the grocery staff allocated each behavioral example to the dimension in which it belonged. Items with high agreement of dimension allocation were retained and then rated on a scale of desirability. Final scale reliabilities of items ranged above .97. These procedures provide information with implications for policy development and worker training throughout the organization.—*Journal abstract.*

PERFORMANCE & JOB SATISFACTION

1939. Armstrong, Thomas B. (IBM Corp., Systems Manufacturing Div., Kingston, N.Y.) **Job content and context factors related to satisfaction for different occupational levels.** *Journal of Applied Psychology*, 1971(Feb), Vol. 55(1), 57-65.—Tested the theory proposed by F. Herzberg, B. Mausner, and B. Snyderman (see PA, Vol. 34:4849) using J. G. Darley and T. Hagenah's rationale relative to occupational level. Ratings of satisfaction and importance for the job content and context factors and overall job satisfaction were obtained from 200 engineers and 153 assemblers. The proposed job factor dichotomy was not supported. However, satisfaction with the content factors made the greatest contribution to overall job satisfaction, regard-

less of occupational level. Conversely, ratings of job factor importance were a function of occupational level; content aspects were most important for engineers, and context for assemblers. Several demographic variables failed to influence the findings. It is concluded that both theories represent oversimplifications. (29 ref.)—*Journal abstract.*

1943. Grigaliunas, Benedict S. & Herzberg, Frederick. (Case Western Reserve U.) **Relevancy in the test of motivator-hygiene theory.** *Journal of Applied Psychology*, 1971(Feb), Vol. 55(1), 73-79. Compared sequence of events and item rating and ranking as methodologies in replication of motivator-hygiene (M-H) theory predictions of job attitudes. A measure of relevance was obtained in order to determine its effect in producing the empirical inconsistencies. Results show that ratings and rankings of items measuring job attitudes are heavily contaminated by irrelevancy. In addition to irrelevancy, the failure of rating and ranking of items to replicate M-H theory predictions seems to be further due to the biases produced by social desirability, value systems and misinterpretations or reinterpretation of items by the respondents. (16 ref.)—*Journal abstract.*

(Georgia State U.) **An analysis of the backgrounds of textile salesmen by means of a biographical inventory: A study to determine if factual data can distinguish between relative degrees of success.** *Dissertation Abstracts International*, 1970(Oct), Vol. 31(4-B), 2339-2340.

1945. Kuipers, H. & van der Vlist, R. (Inst. of Preventive Medicine TNO, Groningen, Netherlands) **Sociaal-psychologische facetten.** [Social-psychological facets.] *Mens en Onderneming*, 1970(Nov), Vol. 24(6), 373-383. Discusses the effects of automation on the psychological adjustment of workers. The process of automated production on the part of the worker is described as being simple in nature, highly repetitive, and operating under specific time limits. The worker requirements include a high degree of manual dexterity and eye-hand coordination. The automated factory is usually controlled by a set of "watch-dog" electric panels, operated by workers who are conditioned to respond almost automatically to emergencies. It is observed that the intrinsic aspects of the job do not develop a clear identification between the worker and his task. The resulting boredom on the part of the worker plus the adverse working conditions, such as an excess noise level, reduce his motivation. Means to reduce the loss of motivation include job rotation, development of a democratic social climate in the factory, and a more flexible personnel organization in the management. The social psychological facets of the employment situation are identified by flexibility of personnel assignment and mutual consideration among the workers. A J Ter Keurs.

1950. Valenzi, E. R. & Andrews, I. R. (Bowling Green State U.) **Effect of hourly overpay and underpay inequity when tested with a new induction procedure.** *Journal of Applied Psychology*, 1971(Feb), Vol. 55(1), 22-27.—Tested J. S. Adams' (see PA, Vol. 40:8736) inequity theory with an induction which did not challenge the workers' job qualifications, eliminating devalued self-esteem as a confounding variable. 31 workers were hired for an hourly pay clerical task in a real job situation and assigned to 1 of 3 groups—overpay, underpay, and control—in a before-after design. Contrary to inequity theory predictions and to previous inequity theory experiments, there were no significant work performance differences among the 3 groups, but 3 of 11 underpay Ss quit the job while no other Ss quit. It is concluded that the results of this experiment combined with the results of other experiments strongly suggest that inequity effects previously reported are probably due to the self-esteem variable. It is suggested that research on wage inequity should focus more on variables, e.g., turnover, satisfaction, and recruitment rather than solely on work performance.—*Journal abstract*.

1951. Vroom, Victor H. & Deci, Edward L. (Carnegie-Mellon U.) **The stability of post-decision dissonance: A follow-up study of the job attitudes of business school graduates.** *Organizational Behavior & Human Performance*, 1971(Jan), Vol. 6(1), 36-49. Describes a follow-up study of V. H. Vroom's (see PA, Vol. 41:5111) experiment which provided evidence of the phenomenon of postdecision dissonance reduction among graduate students in a school of industrial administration who were engaged in the process of choosing organizations in which to begin their managerial careers. The attitudes of those Ss toward their organizations 1 yr. (N=39) and 3 1/2 yr. (N=37) after graduation were examined. It was found that the changed orientations toward the chosen organization exhibited immediately following choice (i.e., increased attractiveness and greater perceived instrumentality for goal attainment) were no longer in evidence after implementation of the choice. Both the attractiveness of the organization and its perceived instrumentality for the attainment of goals decreased markedly during the 1st yr. and remained at a low level for at least the next 2 1/2 yr. The processes underlying the apparent disillusionment on the part of Ss are examined. Implications of results for the phenomenon of post-decision dissonance are also considered. *Journal abstract*.

1952. Waters, L. K. & Roach, Darrell. (Ohio) **Relationship between job attitudes and two forms of withdrawal from the work situation.** *Journal of Applied Psychology*, 1971(Feb), Vol. 55(1), 92-94.—Correlated attitudes concerning the job in general and specific aspects of the work situation with termination decisions and recorded frequency of absences during the following administration of job attitude questionnaire. 160 nonsupervisory female employees. Overall satisfaction and satisfaction with several intrinsic aspects of the work situation were significantly related to the termination criterion. None of the extrinsic variables were related. For the frequency of absence criterion, attitudes toward specific aspects of the work situation showed no consistent relationships when nonattitudinal variables were partialled out, but overall satisfaction was significantly related.—*Journal abstract*.

Stern's Organizational Climate Index: A reconceptualization and application to business organizations.** *Organizational Behavior & Human Performance*, 1971(Jan), Vol. 6(1), 77-98.—Describes how the items in G. G. Stern's Organizational Climate Index

were recently realized according to the concepts appropriate to the business organization—the instrument has been called the Business Organization Climate Index (BOCI). The resulting 24 scales were submitted to 400 analyses and tested for split-half reliability on a sample of 120 senior managers from more than 100 different companies. Factor analysis of the scales revealed 2 main factors, organizational progressiveness and negative control. The reconceptualization was compared with Stern's conceptualization of the items. The construct validity of BOCI was tested by comparing the climate in 3 organizations contrasted in terms of their organization structure. The conclusion presents 12 possible types of data that can be collected about positive and their environments and indicates how the BOCI and Stern's measures fit into such a scheme. SPECIAL ENVIRONMENTS

1968 Andersen, Søren & Christensen, Hans I. (Malmö Hs. Acoustical Investigation, Sweden) Underwater sound localization in man. *Journal of Acoustical Research* 1970(Oct), Vol. 9(4), 315-364. Directional hearing under water was examined in 7 skindivers at 1, 2, 4, 8, and 16 keps. The experiment was performed twice in a free field station and once in a bathyscaphe. Divers indicated the direction of the sound by the median plane of a photograph of the vessel, coming from 1 of 2 transducers placed at angles of 10, 15, 20, 30, 45, and 60°. The results showed great individual variation. Directional hearing under water seems to work on the same parameters as in the air, with differences for the longer wavelength in water. At 1 keps, time/phase cues were effective, and above 4 keps directional hearing is supported by intensity differences. Performance improved with increasing frequency from 2-16 keps. (21 ref.)—*Journal summary*

1969 Brandt, John F. & Hollien, Harry. (U. Florida Communication Sciences Lab.) Underwater hearing thresholds in man as a function of water depth. *Journal of the Acoustical Society of America* 1970, Vol. 46(4, Pt. 2), 893-894.—Obtained thresholds of

human hearing under water depths of 10, 20, and 30 ft. by using 6000 cycles/sec. of varying intensities. Learning, practice, and time limitations were not factors. No significant effect of frequency was noted. Directional shifts (90°) for the 3 conditions of underwater hearing were consistent with those previously reported.

ADVERTISING & CONSUMER PSYCHOLOGY

1972 Vahzi, E. R. & Andrews, L. R. (U. Illinois State U.) Effect of price information on product quality ratings. *Journal of Consumer Psychology* 1972, Vol. 1, 1-10. The effect of price information on product quality ratings was examined in a laboratory experiment. A group of subjects was presented with a list of products and their prices. The subjects were then asked to rate the quality of each product. The results showed that price information had a significant effect on quality ratings. Products with higher prices were rated as higher quality than products with lower prices. This effect was more pronounced for products with higher prices.

ENGINEERING PSYCHOLOGY

1973 Kralj, Jack A. Human factors and bio-technology: A status survey for 1968-69. In *Science and Civil Engineering*. Moscow & Novosibirsk, 1973.

1974 McCormick, Ernest J. Human factors engineering. New York: McGraw-Hill, 1974.

1975 Shneiderman, Richard W. & Hersh, C. Stephen. (Western Michigan U.) Psychophysical assessment of whole body vibration. *Journal of Human Factors* 1975, Vol. 4, 1-10.

The purpose of this study was to determine the psychophysical response of human beings to whole body vibration. The study was conducted in a laboratory setting. The subjects were exposed to various levels of vibration and their responses were recorded. The results showed that the response to vibration was highly individual and that the response was more pronounced at higher frequencies. The study also found that the response to vibration was affected by the duration of exposure and the intensity of the vibration.

The study was conducted in a laboratory setting. The subjects were exposed to various levels of vibration and their responses were recorded. The results showed that the response to vibration was highly individual and that the response was more pronounced at higher frequencies. The study also found that the response to vibration was affected by the duration of exposure and the intensity of the vibration.

judgments against 9-Hz vibration at .08, .26, and .46 g_z. Equal intensity curves derived from the magnitude estimation data show the same general shape and comparable levels as corresponding curves determined experimentally using the intensity matching procedure. These methods provide more systematic and quantitative characterizations of subjective response to vibration than previous approaches which have relied heavily on qualitative descriptions.—*Journal abstract.*

Displays & Controls

1976. Reynolds, H. N. (Cybernetics Research Inst., Washington, D.C.) **The visual effects of exposure to electroluminescent instrument lighting.** *Human Factors*, 1971(Feb), Vol. 13(1), 29-40.—Describes 2 experiments, using 12 male undergraduates in each, with electroluminescent aircraft instrument lighting. In Exp. I, white electroluminescent, green electroluminescent, red incandescent lighting were compared for their effects on dark-adapted, scotopic absolute, and acuity thresholds, using a simulated T-38 instrument panel for light exposure. In Exp. II, white, green, and yellow electroluminescent and red incandescent light were compared in terms of legibility of a transilluminated letter-acuity chart. Exposure to red incandescent lighting at .05 ft-l produced the lowest absolute and acuity thresholds, with white and green electroluminescent producing higher thresholds in that order. Although threshold differences between lighting colors were statistically significant, the absolute differences in visual sensitivity were small for practical purposes. Luminances required for equal legibility of transilluminated letters of various sizes were about the same for red incandescent, and white, green, and yellow electroluminescent lamps. (44 ref.)—*Journal abstract.*

DRIVING & SAFETY

1977. Carlson, William L. & Klein, David. (U. Michigan, Highway Safety Research Inst.) **Familial vs. institutional socialization of the young traffic offender.** *Journal of Safety Research*, 1970(Mar), Vol. 2(1), 13-25.—Analyzed the driving records, academic performance, and police contacts of 8094 male undergraduates at a large state university, and compared each S's history of traffic convictions and crashes with that of his father. The positive correlation found between fathers' and sons' conviction incidence supports the hypothesis that driving behavior is learned more through familial than through institutional socialization and that delinquent familial socialization results in delinquent traffic behavior. This is further supported by the findings that the S with numerous traffic convictions was delinquent in other respects; (a) his academic performance was poorer than that of his conviction-free

peers and poorer than his own capabilities, and (b) he was involved in more nonvehicular offenses than his student without traffic convictions. (16 ref.)—*Journal abstract.*

1978. Finkle, Bryan S. (Santa Clara County Lab Criminalistics, San Jose, Calif.) **Drugs in drinking drivers: A study of 2,500 cases.** *Journal of Safety Research*, 1969(Dec), Vol. 1(4), 179-183.—Reports study of more than 10,000 routine drinking driver investigations from 1966-1968. Approximately 2,500 cases involving 2,700 drug occurrences were noted. Salient facts from a breakdown of the cases are presented including the tabulation of occurring drugs according to their physiological action and number of dangerous drugs encountered. Analytical data were compiled from the fraction of the total cases in which blood alcohol was less than .15% and Ss exhibited definite symptoms of intoxication. These data are evaluated. A distribution by age and sex of those individuals in which drugs were detected was made and the administrative usefulness and judicial outcome of the cases is noted as a guideline in selecting future cases for analysis.—*Journal abstract.*

1979. Johansson, Gunnar & Rumar, Kåre. (Uppsala, Sweden) **Drivers' brake reaction times.** *Human Factors*, 1971(Feb), Vol. 13(1), 23-27.—Attempted to determine the distribution of brake RT which can be expected from drivers who have to brake suddenly and unexpectedly in traffic situations. The experiments were carried out as follows: (a) Brake RT was measured on 321 drivers in an anticipated situation on the road (Brake RT 1). (b) 5 drivers were repeatedly tested in the same way (Brake RT 2), and in a surprise situation (Brake RT 3). (c) The ratio of Brake RT 3 to Brake RT 2 was used as a correction factor and applied to Brake RT 1. The corrected median of the resulting distribution was .9 sec.; 25% of the group was estimated to have a brake RT longer than 1.2 sec.—*Journal abstract.*

1980. Marjanac, Antun, et al. (Hygienic-Epidemiologic Dept., Sarajevo, Yugoslavia) **Epidemiološko izučavanje traumatizma u vojsci.** [Epidemiological study of traumatism in the army.] *Vojnosantitarni Pregled*, 1970(Sep), Vol. 27(9), 377-381.—Investigated the occurrence of physical injury in the army on a sample of 1920 soldiers (1140 recruits and 780 soldiers). In 1 yr. medical examinations due to injury were performed on 574 soldiers (333 recruits and 241 soldiers). The greatest number of injuries by mo. occurred in Jan. and the least in February; by days the greatest number of injuries occurred on Tuesday. On Sunday, when soldiers had no training, the number of injuries was as high as on Friday and Saturday. Presented are types of injuries by the organs of the body, causes of injuries, and days of sick leaves due to certain kinds of injuries. (French & Russian summaries)—*English summary.*

Brief Subject Index

This index supplements the classification of abstracts given in the Table of Contents and is designed to lead the reader to subjects that are more specific than the general categories in the classification. When many abstract numbers are listed under a heading, the reader may find it helpful by matching the numbers found under the two or more headings that specify his particular interest.

Ability (see also Childhood/Ability in)
315, 509, 792, 795, 1079, 1780

Ability/Verbal (SEE Ability, Verbal Behavior)

Abnormal Behavior (SEE Behavior Disorder, Mental Disorder, Neurosis, Psychosis, specific abnormalities)

Abnormal Psychology (SEE Clinical Psychology, Psychopathology)

Abortion

Absolute Judgment (SEE Judgment/Perceptual)

Abstraction (SEE Concept, Generalization, Thinking)

Academic Achievement (SEE Achievement/Academic, Achievement/Academic College, Achievement/Academic Elementary School)

Acceleration (SEE Movement)

Acceptance (see also Social Approval)
1169, 1205, 1746

Accident (SEE Driving, Safety)

Acclimatization (SEE Adaptation)

Acculturation (SEE Conformity, Culture)

Achievement (see also next headings)
209, 354, 1172, 1182

Achievement Motivation (see also Achievement Over & Under)
893, 1182, 1880, 1924

Achievement Need (SEE Achievement Motivation, Aspiration & Aspiration Level, Need)

Achievement Test (SEE Test/Achievement)

Achievement/Academic (see also Achievement/Academic College, Achievement/Academic Elementary School, School Learning, Sex Differences/Academic Achievement)

Conditioning/Avoidance (SEE Learning/Avoidance, Rat/Avoidance & Avoidance Learning in)

Conditioning/Classical
206, 247, 460, 477, 594, 690, 693, 694, 714

Conditioning/Escape (SEE Escape)

Conditioning/Eyeld
477, 511, 532

Conditioning/Interceptive
206, 501, 545, 615

Conditioning/Operant (see also Rat/Conditioning in)
231, 608, 615, 680, 682, 686, 690, 691, 692, 696, 746, 747, 1328, 1336, 1742, 1748, 1791, 1844, 1920

Conditioning/Verbal (SEE Learning/Verbal)

Conference (SEE Symposium)

Confidence Judgment (SEE Certainty)

Conflict (see also Frustration, Learning/Avoidance, Interpersonal Processes)
191, 364, 771, 961, 965, 969, 971, 1041, 1059, 1061, 1105, 1132, 1224, 1262, 1591, 1855

Conformity (see also Authoritarianism, Dominance, Expectation, Interpersonal Influence, Social Influence)
974, 999, 1068, 1076, 1086, 1102, 1116

Congress (SEE Symposium)

Connotation (SEE Meaning, Semantics)

Conscience (SEE Value & Values, Ethics, Motivation)

Conscious States (see also Awareness)
411, 563, 1405, 1483

Conservation (SEE Childhood/Concepts & Problem Solving in)

Conservatism (SEE Political Behavior, Personality Trait)

Consonance (SEE Dissonance)

Constancy (SEE Gestalt Psychology, Visual Perception, Perception)

Consumer Behavior (see also Advertising)
1972

Contagion (SEE Interpersonal Influence, Social Influence)

Content (SEE Information, Meaning)

Context

193, 300, 906, 1111, 1117, 1237

Contraception (SEE Birth Control)

Contribution & Criticism

52, 69, 122, 191, 276, 284, 307, 348, 355, 409, 652, 868, 902, 956, 1012, 1058, 1092, 1101, 1104, 1106, 1149, 1164, 1191, 1202, 1286, 1482, 1496, 1552, 1697, 1763, 1768, 1770, 1779, 1810, 1827

Control (see also Display)

711, 1863

Control/Internal-External

58, 916, 1116, 1123, 1172, 1212, 1604, 1723, 1746, 1856

Convulsion (SEE Electroconvulsive Shock, Nervous System/Disorder of, Epilepsy)

Cooperation

30, 394, 994, 1059, 1065, 1077, 1078, 1083, 1089, 1108

Coordination (SEE Motor Performance)

Coping Behavior (SEE Adjustment/Personal & Social)

Copulatory Behavior (SEE Sexual Behavior-Animal)

Correlation (see also Factor Analysis, Statistics)
35, 56, 1926

Cortex (SEE Cerebral Cortex, Visual Cortex)

Counseling (see also Guidance/Educational, Guidance/Vocational, Interview)

24, 1259, 1260, 1305, 1317, 1475, 1607, 1608, 1609, 1610, 1611, 1612, 1613, 1614, 1616, 1617, 1618, 1619, 1620, 1621, 1809, 1810, 1812, 1813, 1815, 1817, 1818, 1824, 1826, 1828, 1829, 1831, 1832, 1833

Counseling/College (SEE Guidance/Educational, Guidance/Vocational)

Counselor

1259, 1607, 1613, 1615, 1616, 1617, 1815, 1817, 1826, 1827

Countertransference (SEE Interpersonal Processes, Psychotherapy, Psychoanalysis, Therapeutic Process)

Counting (SEE Mathematics, Number)

Court (SEE Law, Crime & Criminals)

Courtship (SEE Interpersonal Attraction)

Creativity (see also Aesthetics, Gifted, Literature, Music, Thinking)

358, 836, 889, 1187, 1188, 1189, 1190, 1191, 1196, 1740, 1754, 1932

Credibility (SEE Experimentation & Experiments, Interpersonal Influence, Social Perception)

Crime & Criminals (see also Delinquency/Juvenile, Law, Prison)

979, 1008, 1323, 1333, 1438, 1462, 1463, 1464, 1465, 1466, 1467, 1468, 1469, 1472, 1543

Crisis & Crisis Intervention (see also Community Services, Emotion)

8, 1173, 1240, 1263, 1309, 1729

Critical Flicker Fusion (SEE Vision)

Criticism (SEE Contribution & Criticism)

Cross-Cultural Differences (see also Culture, Cultures & Countries)

976, 998, 999, 1209

Cue

104, 122, 162, 187, 212, 230, 263, 268, 272, 301, 329, 336, 359, 367, 373, 396, 660, 708, 712, 716, 722, 764, 769, 848, 864, 883, 1053, 1090, 1110, 1178, 1181

Cultural Anthropology (SEE Culture)

Cultural Disadvantage (SEE Socioeconomic Status, Childhood/Disadvantaged)

Culture (see also Cultures & Countries, Ethnology, Social Influence)

961, 964, 966, 967, 969, 973, 974, 975, 976, 977, 979, 988, 1029, 1139, 1150, 1201, 1206, 1225, 1477, 1492, 1842, 1970

Cultures & Countries (see also Culture, Africa, Canada, France, Germany, Great Britain, India, Israel, Japan, Latin America, United States, USSR)

1179, 1209, 1219, 1431, 1442, 1576, 1593, 1752, 1793, 1815

Curiosity (SEE Motivation, Thinking)

Curriculum (see also School Administration, Mathematics, Reading)

12, 1279, 1743, 1759, 1772, 1773, 1806, 1808, 1852, 1857, 1864, 1877, 1878, 1884, 1887, 1890, 1891, 1894, 1898, 1900, 1904, 1905, 1914, 1917, 1919

Cutaneous Sense (see also Skin)

65, 67, 117, 125, 181, 183, 184, 208, 442, 812, 1628, 1677

Cybernetics (SEE Communication, Feedback Computer)

Dark Adaptation (SEE Adaptation/Sensory)

Data Processing (SEE Computer, Statistics)

Day Dreaming (SEE Fantasy)

Deafness & Hearing Disorder

175, 782, 1633, 1634, 1635, 1636, 1637, 1638, 1781, 1792

Death (see also Suicide)

1037, 1167, 1174, 1242, 1355, 1717

Death Penalty (SEE Law)

Deception

194, 1206, 1218

Decision Making (see also Choice Behavior, Game, Learning-Probability)

171, 210, 241, 379, 380, 384, 385, 387, 390, 391, 392, 393, 394, 395, 397, 398, 399, 400, 401, 402, 403, 405, 406, 1061, 1091, 1097, 1100, 1105, 1118, 1503, 1857, 1924, 1951, 1966, 1967

Decoding (SEE Categorical Behavior, Problem Solving, Display)

Defecation (SEE Elimination)

Defense Mechanism (see also Identification, Repression)

194, 198, 638, 933, 1177, 1325, 1397, 1408, 1506, 1571

Defense/Perceptual (SEE Defense Mechanism)

Defensiveness (SEE Defense Mechanism, Personality Trait)

Deja Vu (SEE Familiarity, Parapsychology)

Delayed Reaction (SEE Response)

Delinquency/Juvenile (see also Antisocial Behavior, Crime & Criminals)

979, 1325, 1351, 1424, 1430, 1434, 1470, 1471, 1472, 1473, 1474, 1475, 1476

Delirium (SEE Mental Disorder, Neurosis, Psychosis)

Delusion (SEE Mental Disorder, Neurosis, Psychosis)

Demographic Variables (SEE Population Characteristics)

Denial (SEE Defense Mechanism)

Dependency

64, 607, 861, 914, 1085, 1187, 1450, 1466, 1467, 1468, 1469, 1470, 1471, 1472, 1473, 1474, 1475, 1476

Depression (see also Emotion, Emotional Disturbance)

1295, 1303, 1359, 1363, 1364, 1365, 1373, 1405, 1486, 1491, 1494, 1496, 1501, 1503, 1506, 1512, 1515, 1518, 1577, 1609, 1620, 1716

Deprivation (see also Deprivation/Sensory, Food Deprivation, Isolation, Rat Deprivation in)

694, 861, 1470

Deprivation/Sensory

358, 642, 652, 783

Depth Perception (SEE Perception/Depth)

Desegregation (SEE Integration)

Desensitization Therapy (SEE Behavior Therapy)

Detection

31, 34, 69, 72, 113, 151, 152, 154, 171, 174, 181, 183, 211, 212, 213, 235, 390, 403, 535, 863, 1181, 1503

Developing Countries (SEE Cultures & Countries)

Development (see also Childhood/Development in, Language Development, Maturation)

52, 652, 798, 946, 949, 1001, 1007, 1226, 1614

Dexterity (SEE Hand, Motor Performance)

Diabetes (SEE Blood, Disease)

- Diagnosis** (see also Psychodiagnosis, Schizophrenia/Diagnosis of, Mental Retardation/Diagnosis of)
367, 1229, 1239, 1240, 1428, 1433, 1627, 1657, 1660, 1666, 1722, 1732
- Diagnosis/Differential**
1416, 1422, 1425, 1428, 1429, 1505, 1644, 1680, 1691
- Dial** (SEE Display)
- Diet** (SEE Food)
- Differential Reinforcement at Low Rates of Responding** (SEE Reinforcement Schedule)
- Digestive System** (see also Metabolism)

- Evoked Potential** (SEE Potential Evoked)
- Evolution** (SEE Comparative Psychology, Science Theory)
- Examination** (SEE Educational Measurement, Test Achievement, Test & Testing)
- Exceptional Child** (SEE Education Special, Education Special Remedial, Education Special Mental Retardation, Gifted, Child-

- hood/Handicapped)
Excitation (SEE Inhibition, Potential/Evoked, Stimulation)
Excretion (SEE Elimination)
Executive (SEE Management)
Exercise (SEE Work)
Exhibitionism (SEE Sexual Deviation)
Existential Psychology & Psychiatry (SEE Existentialism)
Existentialism
 6, 1355, 1406, 1455
Expectation & Expectancy (see also Aspiration, Set)
 58, 66, 89, 182, 206, 209, 216, 223, 397, 400, 405, 660, 698, 756, 916, 952, 1046, 1121, 1623, 1979
Experience (see also Familiarity, Practice)
 734, 817
Experience/Early
 412, 451, 651, 652, 653, 785, 809
Experimental Design
 30, 57, 59, 339, 901
Experimental Psychology
Experimentation & Experiments (see also Research, Research Methods)
 44, 58, 170, 188, 255, 957, 1092, 1177
Experimenter Bias (SEE Bias, Experimentation & Experiments)
Expert Testimony (SEE Law, Clinical Judgment)
Exploratory Behavior (see also Rat/Activity in)
 596, 808, 902
Extinction (see also Extinction/Resistance to, Inhibition, Learning, Rat/Extinction in)
 267, 431, 680, 701, 754, 757, 758, 1330, 1337, 1683
Extinction/Resistance to
 237, 246, 682, 744, 752
Extrasensory Perception (SEE Parapsychology)
Extraversion-Introversion
 205, 559, 640, 1846
Eye (see also Retina, Vision)
 90, 118, 493, 533, 634, 706, 1135, 1136
Eye Movement (see also Rapid Eye Movement)
 86, 108, 115, 142, 143, 781, 814, 1559, 1630, 1663
Eye/Id Conditioning (SEE Conditioning/Eye/Id)

Facial Expression (SEE Communication/Nonverbal, Social Perception)
Factor Analysis (see also Correlation)
 42, 43, 792, 910, 1316, 1387, 1388, 1424, 1440, 1496, 1500, 1778
Faculty (SEE Teacher)
Failure (SEE Achievement, Emotion, Anxiety)
Faking (SEE Deception)
Familiarity (see also Experience, Practice)
 201, 204, 265, 339, 345, 369, 375, 396, 447, 669, 769, 839, 867, 1130, 1190, 1704
Family (see also next headings, Marriage, Mother, Father)
 1001, 1002, 1006, 1007, 1022, 1023, 1201, 1225, 1231, 1475, 1717, 1767, 1880, 1977
Family Planning (SEE Birth Control)
Family Relations (see also Parent-Child Relations)
 834, 925, 928, 945, 1067, 1622, 1797, 1855, 1861
Family Therapy
 1317, 1321, 1585, 1619, 1621
Fantasy (see also Dream & Dreaming, Imagery)
 200, 1214, 1216, 1267, 1552
Farming (SEE Rural Environment, Occupation)
Father (see also Parent-Child Relations)
 926, 1268, 1286, 1473, 1602, 1703
Fatigue
Fear (see also Anxiety, Emotion, Motivation, Phobia, Threat)
 384, 435, 452, 632, 673, 688, 689, 715, 723, 1049, 1167, 1342, 1509, 1831
Feeble-mindedness (SEE Mental Retardation)
Feedback (see also Reinforcement)
 74, 87, 108, 160, 182, 207, 215, 218, 253, 376, 733, 859, 860, 897, 948, 1064, 1068, 1075, 1100, 1105, 1218, 1821
Feeding (SEE Food Intake)
Feeling (SEE Emotion)
Femininity (SEE Sex Role)
Fetishism (SEE Sexual Deviation, Sexual Disorder)
Fetus (SEE Pregnancy)
Field Dependence (SEE Dependency)
Field Study (SEE Research Methods, Observation)
Fighting (SEE Aggression, Hostility)
Figural Aftereffect (SEE Aftereffect)
Figure (SEE Stimulus, Pattern, Perception/Form & Shape)
Film
 202, 375, 850, 935, 946, 1100, 1198, 1575, 1933
Fine Arts (SEE Aesthetics, Literature, Music)
Finger (SEE Hand, Motor Performance, Body)
Fish
 421, 431, 647, 648, 692, 728, 780, 784
Flavor (SEE Taste)
Flicker Fusion (SEE Vision)
Food
 622, 641, 643, 659, 778, 826, 841, 1699
Food Deprivation
 484, 662, 665, 667, 672
Food Intake
 414, 431, 446, 450, 453, 455, 458, 480, 553, 557, 621, 656, 657, 660, 665, 670, 671, 672, 677, 699, 739, 767, 940, 1590
Food Preference (SEE Food Intake)
Forced Choice (SEE Choice Behavior, Item, Response, Testing Methods)
Foreign Relations (SEE International Relations)
Foreman (SEE Management)
Forgetting (SEE Extinction, Learning, Memory, Retention)
Form Perception (SEE Perception/Form & Shape)
Foster Home (SEE Family, Community Services)
France
 1189
Freud/S. (SEE Psychoanalysis, Psychoanalytic Theory)
Friendship (SEE Interpersonal Processes, Interpersonal Attraction)
Frigidity (SEE Sexual Disorder)
Frog
 587, 673
Frontal Lobotomy (SEE Brain Lesion, Brain Lesion-Animal)
Frustration (see also Aggression, Conflict, Emotion)
 576, 618, 658, 701, 744, 748, 756, 1296, 1700, 1867

Galvanic Skin Response
 206, 211, 433, 496, 499, 501, 505, 506, 512, 623, 638, 920, 1334, 1640, 1705
Game (see also Recreation)
 386, 391, 394, 397, 400, 915, 931, 1027, 1055, 1059, 1078, 1081, 1082, 1083, 1091, 1120, 1132, 1780, 1847, 1934
Game Theory (SEE Choice Behavior, Decision Making, Learning/Probability)
Gastrointestinal Processes (SEE Digestive System)
Generalization
 224, 245, 250, 473, 477, 713, 787, 883
Generalization/Stimulus (SEE Transfer, Generalization)
Genetics
 4, 790, 1230, 1233, 1478, 1518, 1523, 1530, 1536, 1537, 1596, 1653, 1670, 1671, 1699
Genetics-Animal
 620, 628, 629, 630, 631, 662

Genius (SEE Gifted)
Geriatrics (see also Gerontology)
 420, 951, 1494, 1672, 1732, 1733, 1734
Germany
Gerontology (see also Geriatrics)
 794, 950, 953
Gestalt Psychology
Gifted
Gland (see also Epinephrine, Hormone)
 194, 490, 552, 1571
Goal (SEE Motivation)
Goodenough Test (SEE Projective Technique)
Government
 18, 19, 972, 986, 1003, 1008, 1010, 1879, 1895, 1929
Grades & Grade-Point Average (SEE Achievement/Academic, Achievement/Academic-College, Achievement/Academic-Elementary School)
Grammar
 296, 1144, 1145, 1149, 1902
Graphology (SEE Writing)
Great Britain
 1023, 1184, 1793
Group (see also next headings, Community, Culture, Interpersonal Processes)
 389, 1055, 1057, 1061, 1064, 1065, 1066, 1068, 1073, 1076, 1077, 1096, 1106, 1118, 1174, 1391, 1466, 1753, 1831
Group Discussion
 1058, 1084, 1099, 1253, 1602, 1822
Group Dynamics
 922, 1055, 1057, 1062, 1064, 1068, 1080, 1094, 1100, 1103, 1108, 1120, 1753
Group Influence (SEE Social Influence)
Group Structure (SEE Group, Role)
Group Therapy (SEE Psychotherapy/Group)
Group/Ethnic (SEE Ethnology)
Group/Small (see also Interpersonal Processes)
 1051, 1060, 1075, 1081, 1082, 1088, 1094, 1095, 1100, 1136
Guidance (SEE next headings, Counseling)
Guidance/Child (SEE Psychotherapy/Children, Guidance/Educational)
Guidance/Educational
 1759, 1775, 1810, 1811, 1813, 1815, 1818, 1821, 1824, 1829, 1831, 1832, 1833, 1835, 1841, 1868
Guidance/Vocational
 1819, 1823, 1830, 1832, 1875
Guilt (SEE Emotion, Motivation)
Guinea Pig (SEE Animals)
Gustation (SEE Taste)

Habit (SEE Learning, Extinction)
Habituation
 208, 462, 496, 512, 525, 531, 623, 632, 669, 1531, 1802
Hallucination
 1449, 1451, 1453, 1511, 1515
Hallucinogen (SEE Drugs, Lysergic Acid Diethylamide)
Halo Effect (SEE Rating Scale)
Hand (see also Body, Motor Performance)
 702, 795, 814, 1443
Handedness (SEE Laterality)
Handicap (SEE Childhood/Handicapped, Physical Handicap, Blindness, Deafness & Hearing Disorder)
Handling (see also Experience/Early)
 735, 805
Handwriting (SEE Writing)
Headache (SEE Illness)
Hearing (SEE Audition)
Hearing Loss (SEE Audition, Deafness & Hearing Disorder)
Hearing/Hard of (SEE Deafness & Hearing Disorder)
Heart (see also Blood, Blood-Animal, Blood Pressure, Cardiovascular Processes, Heart Rate)
 545, 607, 612, 617
Heart Rate
 195, 407, 412, 429, 453, 477, 545, 546, 606.

- 607, 608, 609, 610, 612, 613, 614, 615, 616, 619, 638, 691, 814, 832, 858, 1218, 1334, 1371, 1531
- Heat** (SEE Temperature)
- Height** (SEE Physiology)
- Helping Behavior** (SEE Interpersonal Processes)
- Heredity** (SEE Genetics)
- High School** (SEE School, Student/High School, Adolescence)
- Higher Education** (SEE College)
- Hippocampus**
419, 424, 432, 445, 446, 447, 451, 469, 482, 483, 572, 584
- History** (see also Psychology/History of)
962, 1403, 1692, 1782
- Hoarding** (SEE Instinctive Behavior)

290, 683, 797, 869, 961, 967, 1141, 1145, 1146, 1147, 1148, 1473, 1633, 1637, 1639
- Language Development**
836, 866, 874, 884, 1781, 1787, 1882, 1902

Language/Foreign
869, 886, 1140, 1144, 1149, 1150, 1152

Latent Learning (SEE Learning)

Laterality
65, 138, 163, 222, 235, 415, 436, 702, 795, 843, 1683

Latin America
977, 1156, 1460, 1600, 1692

Law (see also Government, Political Behavior)
18, 19, 1008, 1010, 1459, 1836, 1946

Leadership (see also Management)
1016, 1062, 1075, 1080, 1094, 1095, 1391, 1816, 1935, 1954, 1957, 1959, 1960, 1963

Learning (see also next headings, Association, Conditioning, School Learning, Rat/Learning in, Monkey/Learning in, Cat/Learning in, Childhood/Learning in)
184, 230, 231, 232, 233, 234, 235, 238, 240, 243, 274, 280, 284, 290, 307, 369, 373, 375, 401, 431, 544, 548, 683, 684, 744, 771, 1141, 1152, 1448, 1738, 1906, 1961

Learning Disorders
1788, 1799, 1800, 1801, 1803, 1804

Learning Model (SEE Model)

Learning Set (SEE Set, Expectation)

Learning Theory
114, 236, 279, 710, 744, 1504

Learning Transfer
114, 235, 239, 243, 251, 305, 310, 374, 396, 477, 567, 725, 848, 855, 1066, 1712

Learning/Avoidance (see also Rat/Avoidance & Avoidance Learning in)
237, 246, 249, 404, 457, 469, 628, 630, 690, 725, 728, 731, 1328

Learning/Discrimination (see also Discrimination Reversal, Rat/Discrimination in)
242, 253, 261, 279, 396, 442, 620, 700, 701, 708, 710, 711, 714, 751, 848, 851, 852, 1706

Learning/Escape (SEE Escape)

Learning/Incidental (SEE Learning)

Learning/Instrumental (SEE Conditioning/Operant Rat/Conditioning in)

Learning/Maze (see also Rat/Maze Learning in)
628, 679

Learning/Motor
239, 308, 344, 608, 849

Learning/Over (SEE Learning)

Learning/Paired Associate
189, 239, 260, 262, 263, 264, 265, 266, 267, 268, 269, 270, 271, 272, 273, 274, 275, 276, 277, 278, 304, 305, 327, 339, 505, 506, 562, 846, 849, 858, 1712, 1737

Learning/Probability
229, 236, 241

Learning/Reversal (see also Discrimination Reversal)
240, 855

Learning/Serial
252, 259, 264, 268, 285, 297, 303, 310, 317, 326, 332, 335, 345, 1176

Learning/Verbal (see also Learning/Paired Associate)
244, 250, 251, 252, 253, 254, 255, 256, 257, 258, 259, 260, 261, 277, 285, 294, 296, 299, 320, 336, 341, 344, 370, 559, 847, 951, 1040, 1175

Legibility (SEE Display, Writing)

Leisure (SEE Recreation)

Lesion (see also Brain Lesion, Brain Lesion-Animal, Rat/Lesions in, Cat/Lesions in)
428, 552

Liberalism (SEE Political Behavior, Personality Trait)

Licensing (SEE Law)

Light (see also Brightness, Color)
82, 91, 94, 99, 103, 110, 119, 149, 245, 502, 533, 556, 660, 727, 1976

Light Adaptation (SEE Adaptation/Sensory)

Lighting (SEE Brightness, Environment)

Liking (SEE Interpersonal Attraction)

Linguistics (SEE Language, Psycholinguistics)

Listening (SEE Attention, Audition, Speech Perception)

Literature
1188, 1401, 1404, 1413

Lobotomy (SEE Brain Lesion, Brain Lesion-

Animal)

Localization
141, 150, 157, 500, 1968

Logic (see also Thinking)
360, 363

Loneliness (SEE Isolation, Alienation)

Longitudinal Study (SEE Experimental Design)

Loudness (SEE Audition, Noise, Sound)

Love (SEE Emotion)

Lower Class (SEE Socioeconomic Status)

LSD (SEE Lysergic Acid Diethylamide)

Luminance (SEE Brightness, Environment)

Lying (SEE Deception)

Lysergic Acid Diethylamide
563, 1154, 1157

MA Scale (SEE Anxiety)

Machine (SEE Apparatus)

Man-Machine Systems (SEE Engineering Psychology)

Management (see also Business, Leadership)
401, 1253, 1631, 1738, 1814, 1816, 1924, 1935, 1937, 1953, 1954, 1955, 1956, 1957, 1958, 1959, 1960, 1961, 1962, 1963, 1964, 1965, 1966, 1967

Mania (SEE Mental Disorder, Emotional Disturbance)

Manic-Depressive Psychosis (SEE Depression, Psychosis)

Manifest Anxiety (SEE Anxiety)

Marijuana
1154, 1159

Marital Problems (see also Family Therapy)
1074, 1292, 1622, 1623

Marketing & Marketing Research (SEE Consumer Behavior)

Marriage (see also Family, Sexual Behavior)
987, 1001, 1004, 1005, 1006, 1007, 1017, 1096, 1184, 1259, 1489, 1622, 1623, 1639

Masculinity (SEE Sex Role)

Masking (see also Interference)
80, 85, 99, 110, 152, 156, 158, 161, 175, 177

Masochism (SEE Sexual Deviation)

Mass Behavior (SEE Group, Social Behavior-Human)

Mass Media (SEE Communication/Mass)

Maternal Behavior (see also Mother, Parent-Child Relations, Child Rearing)
651, 655, 778

Mathematics (see also Number)
34, 70, 872, 1755, 1909

Mating Behavior (SEE Sexual Behavior-Animal)

Maturation (see also Development)
651, 941

Maudsley Personality Inventory (SEE Test/Personality)

Maze (SEE Learning/Maze, Rat/Maze Learning in, Apparatus-Animal)

Meaning (see also Semantics)
193, 251, 321, 333, 378, 819, 884, 887, 1138, 1145, 1334, 1407

Meaningfulness
58, 232, 238, 258, 265, 271, 273, 299, 304, 315, 317, 357, 820, 1142, 1143, 1151, 1448, 1737

Measurement (see also Educational Measurement, Scaling, Statistics)
36, 133, 413, 611, 1151, 1744

Mediating Response (SEE Mediation)

Mediation
269, 272, 277, 701, 853, 1633, 1748

Medicine (see also Nursing, Physician, Surgery)
817, 994, 1244, 1249, 1274, 1416, 1445, 1716

Memory (see also Recall, Recognition, Retention)
48, 235, 266, 275, 283, 284, 285, 287, 288, 289, 290, 291, 292, 294, 295, 296, 297, 298, 299, 300, 302, 303, 304, 307, 309, 311, 312, 319, 322, 323, 350, 377, 418, 470, 548, 562, 594, 625, 628, 641, 645, 792, 793, 822, 870, 919, 953, 1284, 1291, 1448

Memory/Short Term
34, 163, 295, 308, 320, 321, 322, 323, 324, 325, 326, 328, 331, 332, 333, 334, 335, 337, 338, 340, 342, 343, 344, 346, 347, 348, 349, 420, 506, 565, 601, 681, 851, 854, 858, 1542, 1679

Meningitis (SEE Nervous System/Disorder of)

Menstruation (SEE Biological Rhythms)

Mental Deficiency (SEE Mental Retardation)

Mental Development (SEE Development)

Mental Disorder (see also Neurosis, Psychosis, specific disorders)
918, 1228, 1239, 1272, 1273, 1311, 1312, 1320, 1327, 1416, 1419, 1423, 1424, 1433, 1459, 1479, 1481, 1482, 1484, 1485, 1486, 1487, 1488, 1492, 1495, 1537

Mental Health (see also Adjustment/Personal & Social, Community Services)
987, 995, 1222, 1224, 1256, 1257, 1352, 1353, 1441, 1600, 1601, 1602, 1605, 1615, 1725, 1726, 1727, 1730, 1834, 1839

Mental Hospital & Hospitalization (see also Hospital & Hospitalization, Institution & Institutionalization)
1222, 1247, 1254, 1273, 1281, 1309, 1379, 1380, 1384, 1387, 1388, 1389, 1392, 1394, 1420, 1421, 1426, 1437, 1571, 1582, 1730

Mental Hospital/Programs in
1310, 1353, 1354, 1378, 1381, 1382, 1383, 1385, 1386, 1390, 1391, 1395, 1396

Mental Hygiene (SEE Mental Health)

Mental Patient (SEE Psychiatric Patient)

Mental Processes
831, 976, 1278, 1407, 1513, 1650

Mental Retardation (see also next headings, Learning, Learning Disorders)
1246, 1533, 1596, 1641, 1697, 1698, 1699, 1700, 1702, 1703, 1708, 1798, 1805

Mental Retardation/Diagnosis of
1701, 1710

Mental Retardation/Education in (SEE Education/Special Mental Retardation)

Mental Retardation/Learning in
1362, 1704, 1705, 1706, 1707, 1709, 1711, 1712, 1713

Mental Retardation/Treatment of
1340, 1362, 1713

Mental Retardation/Vocational Rehabilitation & Training in
1603, 1714, 1715

Meprobamate (SEE Tranquilizer)

Metabolism
475, 543, 569, 574, 1645, 1672, 1694, 1699

Method & Methodology (see also Research Methods, Teaching Methods, Experimentation, Measurement, Survey, Experimental Design)
20, 31, 55, 263, 958, 1018

Metropolitan Area (SEE Urban & Suburban Environment)

Middle Age (SEE Adulthood)

Migration (SEE Social Processes)

Milieu Therapy (SEE Mental Hospital/Programs in, Psychotherapy/Methods in)

Military (see also Personnel/Military)
955, 1930

Mind (SEE Cognition, Thinking)

Minnesota Multiphasic Personality Inventory (MMPI)
638, 934, 1171, 1175, 1180, 1208, 1209, 1212, 1259, 1276, 1420, 1431, 1432, 1434, 1436, 1437, 1452, 1467, 1468, 1820, 1832, 1884, 1946

Minority Group (SEE Ethnology)

MMPI (SEE Minnesota Multiphasic Personality Inventory)

Mobility (SEE Movement, Social Mobility, Socioeconomic Status)

Model (see also Imitation)
20, 27, 32, 33, 34, 70, 151, 191, 229, 366, 379, 385, 386, 387, 391, 399, 401, 564, 1049, 1060, 1061, 1162, 1199, 1213, 1289, 1741, 1810, 1922, 1967

Money
1041, 1082, 1122, 1297, 1340, 1395, 1950, 1972

Mongolism (SEE Mental Retardation)

Monitoring (SEE Detection, Attention)

Monkey

27, 416, 433, 436, 437, 441, 444, 453, 463, 484, 488, 520, 644, 645, 702, 765, 777, 779, 781

Monkey/Learning In

437, 681, 685, 708, 712, 749, 757

Mood (SEE Emotion)

Morale (SEE Job Satisfaction, Attitude, Emotion)

Morality (SEE Value & Values, Religion, Ethics)

Mother (see also Maternal Behavior, Mother-Child Relations, Parent)

937, 940, 952, 1002, 1018, 1205, 1267, 1285, 1321, 1340, 1498, 1602, 1703, 1801, 1885, 1889

Mother-Child Relations (SEE Parent-Child Relations, Child Rearing)

Motion (SEE Movement)

Motion Pictures (SEE Film)

Motivation (see also next headings, Achievement Motivation, Incentive, Reinforcement)

196, 197, 199, 200, 201, 649, 659, 662, 703, 797, 820, 856, 893, 915, 931, 948, 1051, 1055, 1122, 1123, 1172, 1180, 1198, 1237, 1538, 1567, 1619, 1741, 1907, 1940, 1943

Motivation-Animal (see also Rat/Motivation in)

484, 649, 667, 680, 690

Motivation/Learning (SEE Learning, Motivation)

Motivation Theory

667

Motor Disorder

641, 1238, 1364, 1668

Motor Learning (SEE Learning/Motor)

Motor Performance

111, 215, 325, 509, 890, 892, 1438, 1674, 1704, 1710, 1798, 1936

Motor Processes (see also Learning/Motor, Muscle)

71, 182, 200, 415, 436, 587, 608, 610, 674, 681, 725, 760, 763, 809, 862, 912, 1526, 1630, 1657, 1675, 1708

Motor Skill (SEE Motor Performance)

Mouse

Paired Associate Learning (SEE Learning/ Paired Associate)

Palsy (SEE Nervous System/Disorder of, Physical Handicap)

Paralysis (SEE Nervous System/Disorder of, Physical Handicap)

Paranoia (see also Psychosis, Neurosis, Schizophrenia, Personality Trait)

1175, 1453, 1512, 1539, 1550, 1561, 1568, 1586, 1587

Parapsychology

7, 8, 9

Parent (SEE Father, Mother, Parent-Child Relations)

Parent-Child Relations (see also Family Relations)

637, 801, 806, 921, 926, 933, 934, 935, 936, 937, 938, 939, 947, 971, 991, 1001, 1002, 1006, 1167, 1267, 1285, 1470, 1473, 1475, 1498, 1619, 1765, 1829, 1855, 1880, 1885, 1893, 1903

Parkinson's Disease (SEE Nervous System/Disorder of)

Pastoral Counseling (SEE Counseling)

Paternal Deprivation (SEE Father, Parent-Child Relations)

Pathogenesis (SEE Etiology)

Patient (see also Psychiatric Patient)

1436, 1445, 1490, 1716, 1717

Pattern

83, 97, 136, 140, 333, 434, 500, 518, 523, 709, 822, 1706, 1936

Peace (SEE International Relations, War)

Peace Corps (SEE Government, International Relations)

Peak Experience (SEE Emotion)

Peer Rating (SEE Peers)

Peers

823, 1093, 1106, 1791

Penitentiary (SEE Prison)

Perception (see also next headings, Intersensory Processes, Childhood/Perception in)

68, 69, 70, 71, 75, 190, 1679, 1710

Perception/Auditory (SEE Auditory Perception)

Perception/Depth

78, 116, 118, 119, 121, 122, 124, 126, 129, 709, 785, 907

Perception/Form & Shape

76, 105, 137, 139, 141, 210, 291, 292, 792, 847, 898, 899, 905, 911, 1798

Perception/Size

67, 120, 122, 123, 125, 127, 129, 907

Perception/Social (SEE Social Perception)

- Perception/Space**
104, 120, 128, 441, 795, 894, 1677
- Perception/Time**
76, 81, 82, 83, 84, 897
- Perception/Visual** (SEE Visual Perception)
- Perception/Weight** (SEE Weight, Perception)
- Perceptual Defense** (SEE Defense Mechanism)
- Perceptual Isolation** (SEE Isolation, Deprivation/Sensory)
- Performance** (see also Job Performance, Motor Performance)
53
- Perseveration** (SEE Personality Trait, Thinking)
- Personality** (see also next headings, Childhood/Personality in, Teacher Attitudes & Personality, the various personality traits)

A READER'S GUIDE TO USING PSYCHOLOGICAL ABSTRACTS

Psychological Abstracts (PA) attempts to cover the world's literature in psychology and related topics. PA publishes abstracts of published primary documents such as technical reports, journals, and monographs. Books and separates are covered by bibliographic citation with an additional annotation if the title is not definitive.

PA is published in two volumes per year (effective January 1971), six issues per volume. A cumulative index is published for each six-month volume.

A monthly issue contains: Table of Contents (classification scheme); abstracts; list of abbreviations used in the abstracts; Author Index; and Brief Subject Index. The Brief Subject Index consists of index heading terms and abstract numbers.

A cumulative index issue contains: Table of Contents for the six-month volume; complete list of all journals regularly searched by PA; list of volunteer abstractors; list of abbreviations used in the abstracts; the cumulative author index for the six-month volume; list of subject index heading terms; and cumulative subject index for the six-month volume, which consists of index heading terms, descriptive phrases for each abstract, four-letter abbreviations indicating languages other than English and abstract numbers.

Within the monthly issue, abstracts are arranged in alphabetical order by author, categorized under the content headings as listed in the Table of Contents. The abstracts are numbered consecutively within a six-month volume.

PA's author index is intended to be a name index only and not a person index. Alphabetical rules are strictly applied, consequently, "J. Smith" and "John Smith" would appear in the index as two separate entries even though they may in fact be the same person. By the same token two entries of "J. Smith" would appear as J. Smith with two abstract numbers following it, even though they may be two different people.

The subject index heading terms are reviewed annually and revised as necessary as subjects of interest to the discipline shift and increase. For example, the term "Drug Usage and Abuse" was added to the list of terms when the increase of articles on the topic and interest in the discipline appeared to demand it. Previous to the addition of this term these articles were placed under terms such as "Drugs," "Drug Effects," "Drug Therapy," and "Drug Addiction." Conversely, as a topic decreases in popularity, it may become necessary to delete a term or combine several terms into one general term.

PA is computer-printed and because of necessary production procedures there is a possibility that on occasion the abstracts representing articles from a single issue of a primary journal may appear in several issues of PA, e.g., an issue of the *Journal of Psychology* may include 20 relevant articles; abstracts for 17 of these articles may appear in the May issue of PA, the other 3, in the June issue.

The following are examples of entries and explanations of their elements.

JOURNAL ARTICLE ENTRY

(1a) Brown, Mildred; (1b) Jones, John J., (1c) Wilson, J. T., & (1d) Carson, E. Norman. (2) (*Boston U.*) (3) Single cell activity in the hypothalamus in intact and adrenalectomized rats. (4) *Psychological Journal*, (5a) 1970(Jan), (5b) Vol. 13(6), (5c) 173-190.—(6) In this replication of a study by A. R. Arnold (7) (see (7a) PA, (7b) Vol. 42: (7c) 1791 and 45: (7d) Issue 1), 123 intact and adrenalectomized male Wistar rats were tested under urethane anesthesia. Adrenal tone increased the mean spontaneous discharge and changed the pattern of firing of anterior hypothalamic neurons. The possible relation of these electrophysiological findings to the effects of adrenalectomy on the CNS is discussed. (8) (German & French summaries) (9) (97 ref.)—(10) *Journal abstract*.

1a-1d—Authors: Only four are listed; if there are more than four authors, the first author is listed followed by et al. Succession marks are not given, e.g., Jr., II, III, etc.
2—Address: A mailable address is included for the first-named author only.

3—Title: Article title including subtitles. If the original article is in a foreign language, that title is given, followed by the English translation in brackets, e.g., (*Parapsychology*).

4—Primary journal title in full.

5a—Year and month of the primary publication issue.

5b—Volume number followed by issue number in parentheses.

5c—Inclusive pagination of the article.

6—Text of the abstract.

7—Reference to a previous entry in *Psychological Abstracts*.

7a—PA—*Psychological Abstracts*.

7b—PA volume number.

7c—PA abstract number.

7d—PA issue number where abstract number is unavailable

at time of publication. When only the issue number is given,

one must consult the Author Index of the PA issue noted in

order to determine the abstract number for the author and

article cited.

8—Summaries included in the primary source are listed when

in language(s) other than that of the article.

9—Number of references is included when 15 or more. May

also appear as pages, e.g., (3 p. ref.).

10—Abstract source.

BOOK ENTRY

(1) Jones, John J. (2) (Ed.) (3) (*U. Chicago, Medical School*) (4) *Sleep and dreams*. (5) New York, N.Y.: (6) Appleton-Century-Crofts, (6a) 1970. (6b) ix, (6c) 396 p. (6d) \$6.50(cloth), (6e) \$2.50(paper).

1—Name of author(s) or editor(s). If more than four authors, the first author is listed followed by et al. Succession marks are not given, e.g., Jr., II, III, etc.

2—Designation of editor.

3—Address of first-named author/editor only.

4—Book title

5—Place of publication.

6—Publisher's name

6a—Year of publication

6b—Prepagination.

6c—Total pagination.

6d—Hardcover price.

6e—Paperback price.

BOOK CHAPTER ENTRY

(1) Wilson, J. T. (2) (*U. California, Santa Cruz*) (3) The stages of sleep. (4) In (4a) J. J. Jones (4b) (Ed.), (4c) "Sleep and dreams." (5) (See (5a) PA, (5b) Vol. 45: (5c) Issue 1) (6) 17-47.

1—Author(s) of chapter cited. If more than four authors, the first author is listed followed by et al. Succession marks are not given, e.g., Jr., II, III, etc.

2—Address of first named author only.

3—Chapter title.

4—Reference to entry in PA which includes bibliographic information for the whole book. When only the issue number is given (see 5c), one must consult the Author Index of the PA

issue noted in order to determine the abstract number for the

Editor of the book.

4a—Editor's name

4b—Editor designation.

4c—Book title.

5—Referral information.

5a—PA—*Psychological Abstracts*.

5b—Volume number.

5c—Issue number.

6—Inclusive pagination for cited chapter.

ABBREVIATIONS

Abbreviations appearing in this volume are listed in alphabetical order in the following tables.

AA	= Alcoholics Anonymous
AC	= alternating current
ACTH	= adrenocorticotrophic hormone
AM	= ante meridiem
amp.	= ampere
bpm	= beats per minute
C	= centigrade
¢	= cents
CA	= chronological age
cc	= cubic centimeter
CER	= conditioned emotional response
CFP	= critical flicker frequency
CNS	= central nervous system
cps	= cycles per second
CR	= conditioned response (or reflex)
CRF	= continuous reinforcement
CRT	= cathode ray tube
CS	= conditioned stimulus
CVC	= consonant-vowel-consonant
db.	= decibel
DC	= direct current
DL	= differential limen
DNA	= deoxyribonucleic acid
DRL	= differential reinforcement of low rates

E	= experimenter
ECS	= electroconvulsive shock
EEG	= electroencephalogram (or -graphy)
EKG	= electrocardiogram
EMG	= electromyogram
ESP	= extrasensory perception
Exp.	= experiment

F	= Fahrenheit
ft-c	= footcandle
ft-L	= foot-lambert

g	= gravity
gm	= gram(s)
GPA	= grade point average
GSR	= galvanic skin response

Hz.	= Hertz
-----	---------

ICS	= intracranial stimulation
im	= intramuscularly
ip	= intraperitoneally
IQ(s)	= intelligence quotient(s)
ITI	= intertrial interval
iv	= intravenously

kc.	= kilocycle
kg.	= kilogram
kg/m	= kilogram per meter
kHz.	= kilo-Hertz

LD	= lethal dose
LSD	= lysergic acid diethylamide

m.	= meter
M	= mean
M	= mole or molar
ma.	= milliamperes
MA	= mental age
MAO	= monoamine oxidase
ml.	= milliliter
mm.	= millimeter
mph	= miles per hour
msec.	= millisecond(s)

N	= number
NREM	= nonrapid eye movement

O	= observer
---	------------

p	= probability
%	= percent

PM	= post meridiem
pps	= pulses per second
PRF	= partial reinforcement effect
PSE	= point of subjective equality
ps	= pounds per sq. in.

r	= product-moment correlation
R	= roentgen
REM	= rapid eye movement
rms	= root mean square
RNA	= ribonucleic acid
rpm	= revolutions per minute
RT	= reaction time

S	= subject
SEU	= subjectively expected utility
SPL	= sound pressure level

TV	= television
----	--------------

UCR	= unconditioned response
UCS	= unconditioned stimulus
UHF	= ultrahigh frequency

V	= volt
VHF	= very high frequency
vs.	= versus

YMCA	= Young Men's Christian Association
YWCA	= Young Women's Christian Association

Test abbreviations include:

California E Scale	(Ethnocentrism)
California F Scale	(Fascism)
CMA scale	= Children's Manifest Anxiety scale
CPI	= California Psychological Inventory
CTMM	= California Test of Mental Maturity
I PPS	= I dwards Personal Preference Schedule
MA scale	= (Taylor) Manifest Anxiety scale
MMPI	= Minnesota Multiphasic Personality Inventory
MMI	= Maudsley Personality Inventory
16 PF	= Cattell's 16 Personality Factor Questionnaire
SVB	= Strong Vocational Interest Blank
TAT	= Thematic Apperception Test
WAIS	= Wechsler Adult Intelligence Scale
WISC	= Wechsler Intelligence Scale for Children

Abbreviations used in authors' addresses are:

Assn.	= association
Assoc.	= associates
Co.	= company
Coll.	= college
Corp.	= corporation
Dept.	= department
Div.	= division
Inst.	= institute
Hosp.	= hospital
Lab.	= laboratory
Inc.	= incorporated
U.	= university
Ave.	= avenue
Bldg.	= building
Blvd.	= boulevard
Ct.	= court
Dr.	= drive
Ft.	= fort
Mt.	= mount
Pkwy.	= parkway
Pl.	= place
PO	= post office
Rd.	= road
St.	= street
N, S, E, W	= North, South, East, West
U.S.	= United States
USSR	= Union of Soviet Socialist Republic

AUGUST 1971

NUMBER 2

GENERAL

OBITUARIES

HISTORY

1981. D'Alessandro, August J. (2705 Paseo Dr., Rancho Cordova, Calif.) **An historical review of "Die Symbolik des Traumes": Chapters I-VI.** *Psychiatric Quarterly Supplement*, 1968, Vol. 42(2), 337-343.—G. H. von Schubert, a 19th century romanticist, wrote the *The Symbolism of Dreaming* in 1814. The purpose of this review is to show that pre-Freudian views on dreaming, symbolism, superego, etc., did indeed exist, and that some of these ideas resemble in an unrefined manner some present-day concepts.—D. Prager.

PHILOSOPHY

1982. **Commenator, George E.** (Boston Coll.) **The phenomenology of love in Max Scheler.** *Dissertation Abstracts International*, 1970(Dec), Vol. 31(6-A), 2967-2968.

1983. Donaldson, George L. (Syracuse U.) **Hume's theory of relations.** *Dissertation Abstracts International*, 1970(Dec), Vol. 31(6-A), 2969.

1984. Garai, László. (Hungarian Academy of Sciences, Inst. of Philosophy, Budapest) **Az ember "szubsztanclonális" és "funkcionális" szükségleteiről.** [The "substantial" and the "functional" needs of man.] *Pszichológiai Tanulmányok*, 1967, No. 10, 131-137.

1985. Heil, John F. (Vanderbilt U.) **The identity theory of mind.** *Dissertation Abstracts International*, 1970(Dec), Vol. 31(6-A), 2973.

1970 (Dec), Vol. 31(6-A), 2915.
1986. Lapointe, François H. (Georgia Coll.) **Psicología fenomenológica de Husserl y Sartre.** [The phenomenological psychology of Husserl and Sartre.] *Revista Latinoamericana de Psicología*, 1970, Vol. 2(3), 377-385.—Husserl reduced the natural human ego to the "transcendental ego," the realm of transcendental, phenomenological self-experience. This transcendental ego is not a part of the natural world, but rather it constitutes the world by being the source of its meaning and objectivity. Sartre's disagreement with Husserl centers in the transcendental ego. For Sartre the ego is neither formally nor materially in consciousness: it is outside, in the world. It is a being in the world, like the ego of another. Sartre has no need for the transcendental ego as the unifier of the contents of consciousness, for consciousness has no contents.—*Journal abstract.*

1987. Lardner, Mary D. (Boston Coll.) The notion of person as self-transcendence in Bernard Lonergan's philosophy. *Dissertation Abstracts International*, 1970 (Dec), Vol. 31(6-A), 2974-2975.

1988. Parfit, Derek. (All Souls Coll., Oxford, Eng-
land) **Personal identity**. *Philosophical Review*, 1971(Jan).

Vol. 80(1), 3-27.—If a man's brain could be divided and each $\frac{1}{2}$ housed in a new body and if the 2 newly constituted bodies survived, would the new persons be identical with one another and with the original? This question cannot be answered, but nothing important is lost as a result. What matters in the continued existence of a person are for the most part relations of degree. It is concluded that the language of identity should be given up.—*H. Ruja.*

1989. Sasso, James J. (Boston U., Graduate School)
Value consciousness for Friedrich Nietzsche. *Dissertation Abstracts International*, 1970 (Dec), Vol. 31(6-A), 2978.

1990. Tarantino, Santo J. (Florida Atlantic U.) On solipsism and social regression. *Psychology*. 1970(Nov). Vol. 7(4), 51-57. The philosophical problem of solipsism and the psychological phenomena of social regression are treated in an attempt to close the gap between and to explicate the relationship between philosophical assumptions and psychological processes. A brief survey of the treatment of the problem of solipsism is presented and then compared to the concept of social regression. The main points are developed on the basis of conceptualizations from systems theory, information theory, and psychoanalytic theory. The view developed is that viable organisms must be open systems and that lesser order systems must come under the control of higher order systems. It is argued that in human systems reason is the ordering principle that allows for the integration of the various subsystems of the human organism. The moral implications of such a view are briefly treated.—J. A. Blazer.

1991. Várkonyi, Dezso H. Az általánosításról. [On generalization.] *Magyar Pszichológiai Szemle*, 1969, Vol. 26(3-4), 462-476.—Reports on the status of the concept of generalization in the philosophy of science. (English & Russian summaries)—*M. Moore.*

1992 Walsh, Dorothy. (Smith Coll.) **Knowing by living through.** *Philosophy & Phenomenological Research*, 1970(Dec), Vol. 31(2) 265-272. Contrasts humanistic knowledge with scientific knowledge. It is claimed that knowledge by living-through constitutes a distinctive mode of knowing. This mode of knowing affords knowledge as realization. Such knowledge, different from simple awareness, allows a person to transcend himself and enter into the situation of another. *J. Cantoni.*

PARAPSYCHOLOGY

1993 Bazak, Jacob. (Magistrates Court, Jerusalem, Israel) **ESP and Judaism.** *Parapsychology Review*, 1970(Sep), Vol. 1(4), 9-13. The Talmud and various historical commentators recognize magic and psychical powers. Maimonides' extreme views against astrology and sorcery were directed toward superstitions and naïve beliefs of his day, not toward ESP phenomena. But in using psychical powers for practical purposes, it must be

recognized that they are often in error and could cause harm. Thus, use of clairvoyants to gain information regarding future events is not allowed although their help in finding lost objects is permissible, as are experiments for the purpose of studying ESP.—*P. F. Grim.*

1994. **Chauvin, Rémy.** (Les Sources, Mitaiville, France) **To reconcile psi and physics.** *Journal of Parapsychology*, 1970(Sep), Vol. 34(3), 215-218.—Proposes that although the facts of parapsychology do not fit in with the physics of today, it cannot be said they do not fit in with long-range physics since the inventory of nature's forces is so far from complete. It cannot even be said that psi contradicts modern physics, only that they are difficult to reconcile. The future of parapsychology could reveal the location of the psi ability in the brain, thus making it susceptible to measurement and control, or psi could be found to be beyond space and time and therefore not be comparable with other natural phenomena.—*Journal abstract.*

1995. **Freeman, John A.** (Inst. for Parapsychology, Durham, N.C.) **Ten-page booklet tests with elementary-school children.** *Journal of Parapsychology*, 1970(Sep), Vol. 34(3), 192-196.—Administered a 10-page ESP test booklet which had given significant results with junior high school and high school Ss to 35 elementary school children. This booklet was designed to differentiate between positive and negative scoring, depending on the kinds and arrangements of targets. Some of the pages in the booklet were made up of trials based on 5 different words, on 1 word repeated 5 times, on 5 different symbols, or on 1 symbol repeated 5 times. As predicted, girls had more hits on trials made up of targets which were all alike (both symbols and words) than they did on those trials made up of 5 different targets, and boys did the reverse. Contrasting the expected positive trials for both boys and girls with the expected negative trials yielded 140 runs with a difference of 49 hits ($p < .02$).—*Journal abstract.*

1996. **Grace, Roy E.** (Beverly Hills United Presbyterian Church, Upper Darby, Pa.) **Parapsychology and biblical religion.** *Pastoral Psychology*, 1970(Sep), Vol. 21(206), 8-12.—The work in parapsychology provides a base for a counteraction to the dogmatism of the crass materialism of much recent religion.—*O. Strunk.*

1997. **Haraldsson, Erlendur.** (Inst. for Parapsychology, Durham, N.C.) **Subject selection in a machine precognition test.** *Journal of Parapsychology*, 1970(Sep), Vol. 34(3), 182-191.—Attempted (a) to replicate a precognition experiment carried out by H. Schmidt (see PA, Vol. 44:4322) using ordinary Ss, (b) to test a method of selecting high-scoring Ss, and (c) to compare 2 different degrees of feedback. Ss faced 4 colored lamps, guessed precognitively which 1 would light up next, and pressed the corresponding button. The button triggered an electronic device which made a random selection of the target lamp. S received limited feedback in $\frac{1}{2}$ the runs and full feedback in the other $\frac{1}{2}$. In a preliminary series with 74 Ss, results were not significant. The 11 best qualified Ss were selected for testing in the main series. The 100 runs of this series were significant at the level of $p = .0005$, which was taken as evidence that the method of selecting the Ss was highly successful. The feedback comparison did not yield any significant differences.—*Journal abstract.*

1998. **Krippner, Stanley & Davidson, Richard.** (Maimonides Medical Center, William C. Menninger Dream Lab., Brooklyn, N.Y.) **Religious implications of para-**

normal events occurring during chemically induced "psychedelic" experience. *Pastoral Psychology*, 1970(Sep), Vol. 21(206), 27-34.—"Whether one accepts, or rejects the experimental evidence for ESP is inconsequential; the critical fact is that subjective impressions and anecdotal reports of telepathy, clairvoyance, and precognition are associated with many religious phenomena." Students of religion need to examine seriously these relationships.—*O. Strunk.*

1999. **Krippner, Stanley & Ullman, Montague.** (Maimonides Medical Center, Menninger Dream Lab., New York, N.Y.) **Telepathy and dreams: A controlled experiment with electroencephalogram-electro-oculogram monitoring.** *Journal of Nervous & Mental Disease*, 1970(Dec), Vol. 151(6), 394-403.—Tests the hypothesis that telepathic communication can appear in dreams. An "agent" spent the night concentrating on a picture. S was awakened after each REM period and reported his dreams. This pattern was followed for 8 nights. S and an outside judge later matched pictures and dream protocols. Correct matchings by both judges achieved high levels of statistical significance. Illustrative data are presented.—*R. A. Denis.*

2000. **Osli, Karlis.** (American Society for Psychical Research, New York, N.Y.) **Informal methods of research in psychic phenomena for religious believers.** *Pastoral Psychology*, 1970(Sep), Vol. 21(206), 35-40.—Outlines informal parapsychological experiments which can be carried out by churchmen and pastors.—*O. Strunk.*

2001. **Otani, Soji.** (Japan Defense Academy, Yokosuka) **The history of parapsychology in Japan.** *Parapsychology Review*, 1970(Sep), Vol. 1(4), 4-5. Discusses the men and books which have been influential in Japanese parapsychology from the 1820s to the 1st Annual Convention of the Japanese Society for Parapsychology in 1967.—*P. F. Grim.*

2002. **Schmeidler, Gertrude R.** (City Coll., City U. New York) **Studying individual psi experiences.** *Journal of Parapsychology*, 1970(Sep), Vol. 34(3), 197-209.—Outlines the areas of analysis which are needed for an understanding of psi. A sociology of psi, its patterns in different cultures and social groups; life history data for causes of changes in an individual's psi ability; research on the conditions which affect psi in short periods like a single experimental session; and a careful examination of the individual psi experience are necessary. The latter is particularly difficult for several reasons: (a) The duration of the individual experience is unknown but probably very brief; (b) any 1 hit in an ESP experiment may be due to chance, not to psi; (c) psi is often given imperfect information; and (d) psi is not ordinarily under conscious control. Suggestions for coping with these difficulties are examined. An ongoing experiment is described which investigates EEG changes related to the individual psi experience while attempting to teach Ss to identify and control psi success.—*Journal abstract.*

2003. **Schmidt, Helmut.** (Inst. for Parapsychology, Durham, N.C.) **A PK test with electronic equipment.** *Journal of Parapsychology*, 1970(Sep), Vol. 34(3), 175-181.—Tested 18 Ss for their psychokinetic (PK) ability. A random number generator (RNG) connected with a display panel produced random sequences of 2 numbers which were determined by a simple quantum process. The display panel was a circle of 9 lamps which lighted 1 at a time in the clockwise (+1) direction or the

counterclockwise (-1) direction depending on which of the 2 numbers the RNG produced. Ss chose either motion and tried by PK to make the light proceed in that direction. There were 4 runs/sessions, each made up of 128 "jumps" of the light. In a preliminary series of 216 runs, Ss had a negative deviation of 129 hits. The main series was expected to give negative scores, and a negative attitude was encouraged among the Ss. 15 Ss carried out 256 runs, with a significant negative deviation of 302 hits ($p=.001$).—*Journal abstract.*

2004. Schmidt, Helmut. (Inst. for Parapsychology, Durham, N.C.) A quantum mechanical random number generator for psi tests. *Journal of Parapsychology*, 1970(Sep), Vol. 34(3), 219-224.—Recent experiments in ESP and psychokinesis have been based on the use of large numbers of randomized targets provided by electronic number generators. The detailed circuitry of an easy to build generator, using radioactive decays as a source of randomization is described.—*Journal abstract.*

2005. Schmidt, Helmut. (Inst. for Parapsychology, Durham, N.C.) The psi quotient (PQ): An efficiency measure for psi tests. *Journal of Parapsychology*, 1970(Sep), Vol. 34(3), 210-214.—A comparison of the psi scoring rate of Ss in 2 different experiments is possible when both experiments involve the same probability of making a hit, e.g., if 1 experiment involved a choice between heads or tails, and the other, a black or red card. The need for a standard measure of efficiency for comparisons when the probabilities of getting a hit are different and the samples of data are of unequal size is emphasized. The "psi quotient" (PQ) is equal to 1000 times the square of the critical ratio (CR) divided by the number of trials (N): $PQ=1000 CR^2/N$.—*Journal abstract.*

2006. Wolf, Manfred. (San Francisco State Coll.) Existential psychology and a romantic poem. *Psychiatric Quarterly Supplement*, 1968, Vol. 42(C), 297-302.—The healthy person can at times forget himself in order to grasp the essence of the other. Only a healthy personality can free itself from its own isolation and enter into a relationship which may temporarily destroy it as an entity. Self-consciousness is the enemy of awareness just as fear is the enemy of self-realization. It is suggested that the satisfaction of the self's absorption into a relationship will someday be studied by neurologists in the laboratory.—*D. Prager.*

THEORY & SYSTEMS

2007. Dahl, Hartvig. (New York U., Research Center for Mental Health) *Relatos de mesas redondas de la Asociación Psicoanalítica Americana: La teoría psicoanalítica de los impulsos instintivos en relación con desarrollos recientes.* [Roundtable discussion reports of the American Psychoanalytical Association: The psychoanalytic theory of instinctive drives in relation to recent developments.] *Revista de Psicoanálisis*, 1970(Jan), Vol. 27(1), 149-175.—Reconsiders Freud's psychoanalytic conception of drive in the light of recent advances in fields such as neurophysiology and experimental and physiological psychology. Research discussed includes: (a) physiological confirmation of Freud's suggestion of generation of libido by the action of sex hormones on certain parts of the brain; (b) the concept of physiological drive activity during REM states; (c) drive gratification during self-stimulation in experimental animals; (d) electric stimulation of the

hypothalamus inducing drive activity in satiated animals; (e) problems related to energy discharge during REM states; (f) application of the psychoanalytic oscillation model to the question of whether or not nonconsummatory appetitive behavior, e.g., thumb-sucking in infants, reflects drive activity, or whether or not prolonged abstinence itself causes an increase in sexual excitement, or fasting causes an intensification of hunger; (h) changes in brain metabolism following liberation of neurotransmitters in the excitatory and inhibitory synapses and postsynaptic membrane potential changes, as related to mental states; and (i) relations of external stimuli to drive intensity.—*T. N. Wehr.*

2008. Hall, Elizabeth Hebb on focus focus: A conversation. *Psychology Today*, 1969(Nov), Vol. 3(6), 20-28.—This interview concerned Hall's early education and his views on genetic, sexual, and racial differences, educational reform, mental illness, the function of theory, religion, and Freudian interpretations of literature.—*E. J. Posner.*

2009. Jacobson, Edmund. *Psychology and the integrative action of the nervous system.* *Acta Symbolica*, 1970(Fal), Vol. 1(2), 31-35.—Distinguishing as distinctly different acts such mental activities as perception, attention, recall, and imagination is erroneous because of the integrative action of the nervous system. Psychology must deal with mental activity as a yet unified system of signals and meanings, with at least 20 different modalities of sensory experience giving rise to different codes which are decoded in terms of action, incipient or overt. (15 ref.)—*M. Cogan.*

2010. Krantz, David H. & Tversky, Amos. (Michigan) Conjoint measurement analysis of composition rules in psychology. *Psychological Review*, 1971(Mar), Vol. 78(1), 1-16.—Decision composition rules as theories that describe the relationships among several measurable variables. Conjoint measurement provides methods for analyzing psychometric information only. This analysis is applied to a case of 4 composition rules in Tversky's $A \succ B \succ C$, $A \succ B \succ C$, $P(A) \succ P(B) \succ P(C)$, which have been widely employed in different areas of psychology. It leads to the formulation of observable rational properties that can be used to test and diagnose soundness of the rules if they are appropriate for a given set of data. (47 ref.)—*Journal abstract.*

2011. Moody, Dick L. (Case Western Reserve U.) A comparative study of organization in physical science and social science. *Journal of General Psychology*, 1971(Dec), Vol. 77(4), 331-341.

2012. Rudas János. *A pszichológia a tudományok rendszereben.* [Psychology in the system of sciences.] *Psychologica Hungarica*, 1969, Vol. 12, 1-14.

2013. Smith, Ronald A. B. *The relationship between the type theory and the personality growth theory of Carl Jung and the helping relationship theory of Carl Rogers.* *Humanistic Approach to Psychology*, 1969, Vol. 1, 43-44.

EDUCATION & TRAINING

2014. Howe, M. A. Training of psychologists in a government department. *Australian Psychologist*, 1969(Nov), Vol. 4(3), 101-114.—Discusses the course designed to train psychologists for positions in the Department of Labour and National Service in Aus-

tralia. Course objectives are listed, and outlines of the original 5-phase course and a revised 3-phase course are presented.—*R. Wiltz.*

2015. **Lubin, Bernard & Eddy, William B.** (U. Missouri, Medical School, Kansas City) **The laboratory training model: Rationale, method, and some thoughts for the future.** *International Journal of Group Psychotherapy*, 1970(Jul), Vol. 20(3), 305-339.—"The history of laboratory training in the United States is predominantly the history of the NTL [National Training Laboratory] Institute for Applied Behavioral Science. We have drawn to a large extent from the published material by the NTL Institute and its faculty who are based in various universities . . . there is more than 1 T-group in the laboratory model, multiple groupings are used, multilevel learnings (personal, interpersonal, and, in some laboratories, group and organizational) are sought, prior staff planning attempts to match client learning needs with a large group of technologies, conceptualization of experience is encouraged, and opportunity for integration and discussion of transfer of learning to back-home situations is provided. Also, laboratory training is defined as an educational rather than a therapeutic procedure." The differences in process and outcome between the T-group, group psychotherapy, and encounter group are discussed. Because of the anticipated increase in the variety and number of social problems to which laboratory training will be applied, a training center to develop applied behavioral scientists was announced by the NTL Institute: The New University for the Applied Behavioral Sciences to be located in the Washington, D.C., area. "Major organizational units of the university are: The NTL Institute, The College of Applied Behavioral Science, and the Institute for a Voluntary Society." (48 ref.)—*I. Linnick.*

2016. **Wellner, Alfred M. & Simon, Ralph.** (State Dept. of Mental Hygiene, Baltimore, Md.) **A survey of associate-degree programs for mental health technicians.** *Hospital & Community Psychiatry*, 1969(Jun), Vol. 20(6), 166-169.—"By September 1968 there were 26 mental health training programs in community colleges, and another 35-50 in some stage of development." The training programs emphasize interviewing skills, counseling and psychotherapy, community resources, and techniques of behavior modification and research skills. Job skills and degree of acceptance and integration into the mental health system must be assessed before new programs are institutionalized.—*B. A. Burkard.*

PROFESSIONAL DEVELOPMENTS

2017. **Brody, Eugene B.** **The concerns of transcultural psychiatry.** *American Journal of Psychoanalysis*, 1970, Vol. 30(2), 179-182.—Presents a joint statement by the committees of the American and Canadian Psychiatric Associations, setting forth concerns of the field termed "transcultural psychiatry." Both investigation and clinical work are included. 12 problems and areas of application are noted. Members of the committee issuing the statement are listed.—*H. Roemmich.*

2018. **Foss, B. M. (Ed.)** **Psychology in Great Britain.** *Bulletin of the British Psychological Society, Supplement*, 1969, 48 p.—This commemorative supplement, on the occasion of the 19th International Congress of Psychology, held in London in 1969, includes 19 articles covering clinical, educational, occupational, engineering, medical, and physiological psychology, as well as

research on aging, child development, psycholinguistics, and animal behavior and ethology in Great Britain. Also presented are reports on British psychological societies, national institutes, child guidance clinics and school service, chairs of psychology in British universities, and financing psychological research. A list of journals published in Great Britain and a summary of all International Congresses from 1889-1966 are provided.—*V. S. Sexton.*

2019. **Hogan, John D.** (Ohio State U.) **A survey and interpretation of article characteristics: The "Journal of Genetic Psychology" 1945-1969.** *Dissertation Abstracts International*, 1971(Jan), Vol. 31(7-B), 4314.

2020. **Landauer, Ali A.** (U. Western Australia, Perth) **The SI (new metric system) in psychological research and reporting.** *Australian Psychologist*, 1969(Nov), Vol. 4(2-3), 175-181.—Describes the basic aspects of the new metric system (SI) which has recently been adopted by the Council of Editors of the journals published by the American Psychological Association. The 6 basic SI units are defined in terms of physical quantity, name of unit, and symbol for unit. Examples of derived SI units which are frequently used in experimental psychology are provided, and a table for converting some of the more frequently used non-SI values into SI units is presented.—*R. Wiltz.*

INTERNATIONAL PSYCHOLOGY

2021. **Sipos, István.** (Hungarian Academy of Sciences, Inst. of Psychology, Budapest) **A Magyar nyelvű pszichológiai irodalom kezdetei.** [Beginnings of Hungarian psychological literature.] *Pszichológiai Tanulmányok*, 1967, No. 10, 817-825.

GENERAL BOOKS & REFERENCE WORKS

2022. **Epstein, William & Shontz, Franklin.** (U. Wisconsin) **Psychology in progress.** New York, N.Y.: Holt, Rinehart, & Winston, 1971. xiv, 428 p.—An introductory college text designed to present students with a sampling of content and method rather than encyclopedic coverage. Certain specific problems that interest modern investigators are examined in depth, including perception, memory, cognition, regulatory centers, sleep and dreams, stress, aggression, decision, naturalism, behavior control, body experience, individual differences, and schizophrenia.—*A. M. Cawley.*

METHODOLOGY & RESEARCH TECHNOLOGY

2023. **Fletcher, F. Garth; Stoddard, Lawrence T., & Sidman, Murray.** (Massachusetts General Hosp., Boston) **A system for unlimited repetitive presentation of auditory stimuli.** *Journal of Experimental Child Psychology*, 1971(Feb), Vol. 11(1), 165-169.—Outlines procedures for recording auditory stimuli for repetitive presentation. Most procedures produce wear and tear on the recording and playing apparatus. An alternative system is described in detail which utilizes 2 tape recorders and a tape loop. The resulting loop ensures identical and evenly spaced repetition with minimal depreciation of the master tape and recorder.—*S. Knapp.*

2024. Sawyer, Jack. (Northwestern U.) Measurement and prediction, clinical and statistical. *Studies in Personnel Psychology*, 1970(Oct), Vol. 2(2), 74-99.

2025. Thompson, John W. (U. London, Inst. of Education, England) **Discussion: Polarity in the social sciences and in physics.** *Philosophy of Science*, 1968(Jun), Vol. 35(2), 190-194.—Discusses the tendency of social scientists to overlook directionality in measurement and to be insufficiently aware of problems of polarity. This is felt to be especially true of psychologists who often employ unidirectional instead of bipolar measurement. These problems of measurement are compared to the problems of measuring space and time in the realm of physics. It is concluded that empiricism in physics and the social sciences is deficient unless supported by a rational philosophy which considers many problems of polarity. (21 ref.).—P. McMillan.

MODELS & MATHEMATICAL MODELS

2026. Brink, Nicholas E. (Pennsylvania State U.)
Effect of item discrimination in the Rasch model.

Proceedings of the Annual Convention of the American Psychological Association, 1971, Vol. 6(Pt. 1), 101-102.—Item discrimination is a parameter not provided for in the Rasch model. The effect of this parameter in measuring ability was examined using simulated data. 2 effects were noted: (a) increases in item discrimination decreases the unit of measure of the ability, (b) increases in item discrimination decreases the number of items that contribute to the measurement of a particular level of ability thus increasing the standard error of that level of ability. Increases in the density of items at points along the ability continuum decrease the standard error of ability estimates at those points. *Author abstract.*

2027. **Brink, Nicholas E.** (Pennsylvania State U.) **Overview of the Rasch model.** *Proceedings of the Annual Convention of the American Psychological Association*, 1971, Vol. 6(Pt. 1), 95-96. Presents topics that tie the Rasch model to other more commonly understood topics, thus clarifying its position in the area of measurement and research. This model produces ability estimates that are independent of the sample of Ss and the set of items used, thus it is a latent trait model. The simplicity of this 2-parameter model allows this objectivity or independence within the model to occur. Yet this makes the model more restrictive as to the characteristics of items that compose the test—items need to be of equal discrimination. Because of the advantages of objectivity, refinement of items to fit this model seems called for. *Author abstract.*

2028. **Dalrymple-Alford, E. C.** (American U., Beirut, Lebanon) **A model for assessing multiple-choice test performance.** *British Journal of Mathematical & Statistical Psychology*, 1970(Nov), Vol. 23(2), 199-203. Describes a model, essentially a formulation of a hypothesis by B. B. Murdock, developed for the case where an S is presented with N alternatives from which he has to choose the single correct 1. It is assumed that the S randomly selects an alternative from a subset consisting of from 1 to N of the alternatives presented. For a given set of alternatives the size (i) of this choice set will depend on S's knowledge, which consequently may be measured by some suitable function of i, or, alternatively, of (N - i). 2 measures are considered, which require a modification of the usual test procedure, so that Ss are allowed repeated attempts until the correct

alternative is selected. The model is shown to be successful in predicting performance in the n -alternative case from N -alternative performance ($N \gg n$). — *Journal abstract.*

2029. Erlebacher, Albert & Sekuler, Robert. (Northwestern U.) **Response frequency equalization: A bias model for psychophysics. *Perception & Psychophysics* 1971(Mar), Vol 9(3-A), 315-320**—Derived a model for response bias in psychophysics. Of the model's 2 aspects, 1 is concerned with the generation of sensory states and the other with rules for transforming sensory states into responses. The model incorporates the bias rule that Ss tend to use available responses with equal frequency. Applications to experiments which use the method of constant stimuli are discussed. Despite the contrary claims of F. Restle and M. Levinson (see PA, Vol 42:16441), the model not only predicts their data quite well but also, under certain conditions, does so better than the theory of adaptation level used by Restle and Levinson themselves. *Journal abstract*

2030. Jöreskog, Karl G. (Educational Testing Service, Princeton, N.J.) **Estimation and testing of simplex models.** *British Journal of Mathematical & Statistical Psychology*, 1970(Nov), Vol 23(2), 121-145. Formulates various statistical models for simplex structures in terms of the Wiener and Markov stochastic processes. A distinction is made between a perfect simplex and a quasimplex. For each model, problems of identification, estimation of the parameters, and testing the goodness of fit are considered. All models can be estimated by a general method for covariance structures developed by K. G. Jöreskog. Simplex methods which may be used in some cases are also presented (17 ref.) *Journal abstract.*

2031. Treisman, Michel. (U. Reading, England) **Brightness contrast and the perceptual scale.** *British Journal of Mathematical & Statistical Psychology*, 1970(Nov), Vol 23(2), 205-224. Presents a model for brightness contrast which assumes 2 processes: an initial "perceptual" transformation of visual intensity information, followed by lateral inhibitory interactions which can be represented linearly. The model has been applied to appropriate data and it appears to provide a satisfactory account of both brightness enhancement and depression for homogeneous areas under stable conditions of viewing. This application of the model also provides evidence on the form of the function relating the relevant perceptual correlate of stimulus intensity to the physical values. This appears to be consistent with previous evidence that this relation is a power function with an exponent lying within a range about unity. (37 ref.)—*Journal abstract.*

MATHEMATICS & STATISTICS

2033 Boruch, Robert F., Larkin, John D., Wolins, Leroy, & MacKinney, Arthur C. (American Council on Education, Washington, D.C.) **Alternative methods of analysis: Multitrait-multimethod data.** *Educational & Psychological Measurement*, 1970(Win), Vol. 30(4), 833-853. Factor analysis and analysis of variance models are contrasted in a multitrait-multimethod design. The data used were personnel ratings. Rater bias was

considerable. The several models produced similar results. "Maximum likelihood estimates of factor loadings provide information on . . . error, trait and method variance." Factor analyses consider measure reliability but solutions are indeterminate.—*N. M. Chansky.*

2034. **Bruni, Piero.** (U. Florence, Inst. of Education, Italy) **Presentazione delle tavole di Payne & Anderson per i livelli di significatività del Kuder-Richardson Formula 20.** [Presentation of the Payne and Anderson tables for the levels of significance of Kuder-Richardson's Formula 20.] *Bollettino di Psicologia Applicata*, 1969, No. 91-93, 77-90.—Studied the Payne and Anderson Tables as a means of comparison for controlling the theoretic probability of a coefficient of internal consistency. Kuder-Richardson's coefficient is listed among indispensable information regarding a test in the *Standards for Educational and Psychological Tests and Manuals*, and is 1 of the most frequently used indices used to demonstrate the homogeneity of the items. According to the *Standards*, this index should always accompany any measurement presented as a unidimensional example. r_{20} expresses the proportion of variance due to the 1st factor extracted from the intercorrelation of the items. Often with tests in the experimental stage or translated tests and with the majority of personality tests, r_{20} is the only guarantee that the test measures something.—*A. M. Farfaglia.*

2035. **Clark, James A. & McQuitty, Louis L.** (U. Missouri) **Some problems and elaborations of iterative, intercolumnar correlational analysis.** *Educational & Psychological Measurement*, 1970(Win), Vol. 30(4), 773-784.—Explicates a method of intercolumnar correlational analysis of association of objects in the determination of types. Matrices which do not converge to positive or negative ones are interpreted in terms of systems, quasi-types, and types. Among the special instances discussed are 3 separable variables in 2-dimensional space and identical off-diagonals with a set of +1s and -1s.—*N. M. Chansky.*

2036. **Cohen, Jacob.** (New York U.) **Approximate power and sample size determination for common one-sample and two-sample hypothesis tests.** *Educational & Psychological Measurement*, 1970(Win), Vol. 30(4), 811-831.—Explains the interdependence of alpha, N, power and population effect. A table is presented for determining power given alpha and the hypothesized effect. Illustrative examples for determining power are given. Sample size is discussed. The null hypothesis is often erroneously said to be proved because insufficient attention has been paid to power.—*N. M. Chansky.*

2037. **Cooper, Lee G.** (U. California, Los Angeles) **A procedure for metric multidimensional scaling.** *Proceedings of the Annual Convention of the American Psychological Association*, 1971, Vol. 6(Pt. 1), 87-88.—Developed a new solution to the additive constant problem in metric multidimensional scaling. This solution determines, for a given dimensionality, the additive constant, and the resulting stimulus projections on the dimensions of a Euclidean space, which minimizes the sum of squared discrepancies between the formal model for metric multidimensional scaling and the original data. A modification of Fletcher-Powell style functional iteration is used to compute the solution. A scale free index of the goodness of fit is developed to aid in selecting solutions of adequate dimensionality from multiple candidates.—*Author abstract.*

performance of the linear discriminant function in two variables. *British Journal of Mathematical & Statistical Psychology*, 1970(Nov), Vol. 23(2), 165-176.—Presents the discriminant function in unnormalized and in normalized form. For the 2-variable case, certain parameter-dependent features are discussed. Sampling features (expectations and variances of various statistics) are detailed. The usefulness of the discriminant function for classification is noted.—*Journal abstract.*

2039. **Demaree, Robert G. & Jernigan, Larry R.** (Texas Christian U.) **Equiloading component of a set of measures.** *Proceedings of the Annual Convention of the American Psychological Association*, 1971, Vol. 6(Pt. 1), 91-92.—The equiloading component of a set of measures is the linear combination with respect to which the measures have the same loading. Although the relation of this component to the p inverse scores is discussed, emphasis is placed on a reduced-rank, least-squares solution for obtaining the combinatorial weights. Applications of the equiloading component are considered, and an illustrative example is given.—*Author abstract.*

2040. **Eberhard, Kurt.** (Hans Zulliger Haus, Psychiatric-Psychologic Dept., Berlin, W. Germany) **FM-Ein Mass für die Qualität einer Vorhersage aufgrund einer mehrklassigen Variablen in einer k-2-Felder-Tafel.** [A measure of prediction quality for multiple class variables in a $k \times 2$ matrix.] *Zeitschrift für experimentelle und angewandte Psychologie*, 1970, Vol. 17(4), 592-599.—Proposes a new measure of prediction error, FM, applicable for multiple variables and dichotomized criterion. A nominal scale for the variables is sufficient. Comparison with various other error measures is used as aid in interpreting FM. (English & French summaries)—*W. J. Koppitz.*

2041. **Erviti, Vivian F.** (New York U.) **An investigation of the effect of non-normality on the biserial correlation using a Monte Carlo technique.** *Dissertation Abstracts International*, 1971(Jan), Vol. 31(7-B), 4309-4310.

2042. **Hayes, Donald P., Meltzer, Leo, & Wolf, Gerritt.** (Cornell U.) **Substantive conclusions are dependent upon techniques of measurement.** *Behavioral Science*, 1970(May), Vol. 15(3), 265-268.—Describes 2 methodological difficulties which may hinder research in the development of formal analyses of sequential social behavior. Trivial decisions, e.g., how to operationally define one's unit of observation or how often to observe the units so defined, may have profound effects on the conclusions drawn from the data. The formal model chosen as best fitting the data may be rejected or found adequate depending upon the measurement decisions adopted. 2 empirical analyses are cited to support this contention: it is shown (a) how closely predictions of behavior based on past performance are dependent upon the level of complexity of the units utilized in the analyses, and (b) that a Markov model of sequential dependencies in conversational speech was supported using 1 set of observational sampling rates but rejected when different rates were used.—*Journal abstract.*

2043. **Holthouse, Norman D.** (Ohio U.) **An empirical analysis of selected procedures for testing the equality of variance-covariance matrices.** *Dissertation Abstracts International*, 1970(Dec), Vol. 31(6-A), 2756.

2044. **Joe, George W.** (Texas Christian U.) **Relationships among several sets of partial regression**

weights. *Proceedings of the Annual Convention of the American Psychological Association*, 1971, Vol. 6(Pt. 1), 93-94.—Presents a method of investigating the relationships among sets of partial regression weights. The basis of this investigation is the covariance matrix for the several sets of partial regression weights. Likelihood ratio tests for testing independence among the several sets of partial regression weights or for testing a hypothesized covariance matrix among the sets of partial regression weights is considered as a possible means for modeling the underlying structure of the covariance matrix. Canonical correlation is considered as an alternative tool.—*Author abstract.*

2045. Kennedy, John J. (Ohio State U.) **The eta coefficient in complex ANOVA designs.** *Educational & Psychological Measurement*, 1970(Win), Vol. 30(4), 885-889.—It is shown that the formulation of eta squared due to Kerlinger, i.e., between SS/Total SS, is an effective descriptive statistic usable as an ex post facto measure of association in complex studies. Unlike the Cohen and the Friedman statistic, η^2 , F/η^2 , f^2/η^2 , it is unaffected by the "nature and number of variables in the design of a study."—*N. M. Chansky.*

2046. Kristof, Walter & Wingersky, Bary. **A generalization of the orthogonal Procrustes rotation procedure to more than two matrices.** *Proceedings of the Annual Convention of the American Psychological Association*, 1971, Vol. 6(Pt. 1), 89-90.—Where 2 factor matrices derived from different data bases are to be compared the orthogonal Procrustes procedure is frequently used. A method for comparing more than 2 factor matrices, obtaining an "average" factor matrix and a set of orthogonal matrices rotating this "average" factor matrix toward the given factor matrices is presented. A computer program implementing the method is available.—*Author abstract.*

2047. Maxwell, A. E. & Everitt, B. S. (U. London, Inst. of Psychiatry, England) **The analysis of categorical data using a transformation.** *British Journal of Mathematical & Statistical Psychology*, 1970(Nov), Vol. 23(2), 177-187.—Draws attention to the advantages, from the viewpoint of interpretation, of analyzing multiway contingency tables by fitting constants to the marginal frequencies. It is then shown how the constants may be fitted by the method of maximum likelihood and estimates of their variances obtained. The procedure is illustrated by a worked example of a survey into normal drinking habits, with 403 male and 508 female Ss. (16 ref.)—*Journal abstract.*

2049. Mukherjee, Bishwa N. (York U., Toronto, Ontario, Canada) **Likelihood ratio tests of statistical hypotheses associated with patterned covariance matrices in psychology.** *British Journal of Mathematical & Statistical Psychology*, 1970(Nov), Vol. 23(2), 89-120.—Proposes a number of statistical tests for testing whether an observed covariance matrix is consistent with an expected covariance matrix deduced from an assumed composition of the variates. This aspect of multivariate analysis has no univariate analog and, as yet, has not received proper treatment in the statistical literature. The general method proposed has been called "structural analysis" and its role in multivariate hypothesis-testing is discussed. 2 different types

of patterned covariance matrices arising out of various linear models are considered. The "reducible pattern," composed of covariance matrices which can be diagonalized by pre- and postmultiplication by a known matrix, and covariance matrices which can be transformed to a tridiagonal form (e.g., the Guttman quasisimplex, and the "aristocratic" matrices), are discussed and illustrated with empirical data. Likelihood ratio tests for both classes of patterns have been constructed, and in each case the estimation procedure has also been tackled. (64 ref.)—*Journal abstract.*

2051. Pollack, Irwin. (U. Michigan) **Methodological examination of the PEST (parametric estimation by sequential testing) procedure: II. Perception & Psychophysics**, 1971(Feb), Vol. 9(2-B), 229-230.—Finite-state Markov sequences were constructed by a small digital computer, translated to interval-coded electrical pulse trains, and converted to sound. An adaptive stimulus programming procedure of variable step size, PEST, was employed to obtain interstate interval thresholds as a function of restrictions upon the internal structure of the sequences. These thresholds are not independent of the exit criterion for the adaptive procedure. An interactive approach is suggested for determining the exit criterion in order to protect the data against arbitrary decisions made by the E.—*Journal abstract.*

2052. Rendleman, Paula; Rose, Richard M., & Teller, Davida Y. (U. Washington) **Statistical properties of Pollack's PEST procedure.** *Perception & Psychophysics*, 1971(Feb), Vol. 9(2-B), 208-212.—Studied the bias and variability of threshold estimates produced by Pollack's parametric estimation by sequential testing (PEST) procedure by means of repeated computer simulations of PEST runs. The influence of the size of the exit criterion, the bumping-into-zero rule, and 3 methods for obtaining the estimate from the data are discussed. Pollack's PEST procedure is found to result in a highly variable number of trials/run, and to be approximately as good as a simpler staircase procedure in terms of the bias and variability of the estimates obtained. *Journal abstract.*

2053. Richards, Bernard L. & Thornton, Carl L. (Kent State U.) **Quantitative methods of calculating the d' of signal detection theory.** *Educational & Psychological Measurement*, 1970(Win), Vol. 30(4), 855-859.—Describes a new scoring technique for signal detection. The deviations of several scoring methods from the least squares fit are given.—*N. M. Chansky.*

2054. Rock, Donald A., Linn, Robert L., Evans, Franklin R., & Patrick, Cathleen. (Educational Testing Service, Princeton, N.J.) **A comparison of predictor selection techniques using Monte Carlo methods.** *Educational & Psychological Measurement*, 1970(Win), Vol. 30(4), 873-884.—4 methods of predictor selection are contrasted: (a) the predictor with the largest loading on the vector associated with the smallest latent root is eliminated after each principle component analysis, criterion independent; (b) elimination of the predictor most closely approximates linearity, criterion dependent; (c) forward; and (d) backward. 2 conditions were studied: high and low intercorrelations. Results indicate that the forward and backward methods were as efficient

as the criterion independent methods. The forward selection procedure, however, was the more economical and was especially useful with small size N . The danger is emphasized of adding too many variables when sample is in relation to the number of predictors.—*N. M. Chansky.*

2055. Rouanet, H. & Lépine, D. (National Center of Scientific Research, Lab. of Experimental & Comparative Psychology, Paris, France) **Comparison between treatments in a repeated-measurement design: ANOVA and multivariate methods.** *British Journal of Mathematical & Statistical Psychology*, 1970(Nov), Vol. 23(2), 147-163.—Investigates several methods available for testing comparisons between treatments in a repeated-measurement design, within the framework of the general multinormal model. Various ratios are considered, and the weakest assumptions required for the validity of each F ratio are presented. When several F ratios are valid, power considerations are introduced for purposes of choice. Methods enabling the testing of validity assumptions are also presented, together with alternative multivariate statistics which can be used when no F ratio is valid. All procedures are illustrated by a numerical example of an RT experiment of temporal uncertainty using 9 Ss.—*Journal abstract.*

2056. Shepherd, Donald O. & Winiewicz, Casimer S. (U.S. Naval Examining Center, Great Lakes, Ill.) **The compleat formula for the standard error of the mean.** *Proceedings of the Annual Convention of the American Psychological Association*, 1971, Vol. 6(Pt. 1), 97-98.—Presents a compleat formula for the standard error of the mean and other formulas which are special cases of the compleat formula.—*Author abstract.*

2057. Sirotnik, Ken. (U. California, Los Angeles) **An analysis of variance framework for matrix sampling.** *Educational & Psychological Measurement*, 1970(Win), Vol. 30(4), 891-908.—Proposes an analysis of variance approach to matrix sampling where examinees are in the rows and items in the columns. The algebra is due to Hooke who used symmetric polynomials of elements in a matrix. Assumptions to be met are random sampling of rows and columns. Because negative variances may obtain, several procedures were proposed to deal with them. The most promising was treating all estimates in multiple matrix sampling alike regardless of sign. Proofs of the theorems are presented.—*N. M. Chansky.*

2058. Stoloff, Peter H. (U. Rochester, Center for Naval Analyses) **Correcting for heterogeneity of covariance for repeated measures designs of the analysis of variance.** *Educational & Psychological Measurement*, 1970(Win), Vol. 30(4), 909-924.—Homogeneity of covariance is assumed, though often violated, in repeated measures analysis of variance. Several methods have been suggested for dealing with heterogeneous covariances: Hotelling's T^2 and Box' adjustment of the degrees of freedom by epsilon. A Monte-Carlo procedure generated a $K \times N$ matrix with zero mean, unit variance, and zero covariance. The F test was found to be robust with respect to violations of homogeneity of covariance. The Box adjustment of degree of freedom results in a relatively unbiased F test.—*N. M. Chansky.*

2059. Stone, Leroy A. & Coles, Gary J. (U. North Dakota) **Reliability of a correlational similarity matrix.** *Perceptual & Motor Skills*, 1971(Feb), Vol. 32(1), 78.—Attempted to formulate a logic for estimating the reliability of the key construct—correlational similarity

—of the Stone-Coles new methodological revision of the multidimensional scaling method-model. A scheme is presented "whereby the reliability of any set (a matrix) of correlational similarities can be estimated."—*P. McMillan.*

2060. Stone, LeRoy A. & Shepel, Lawrence F. (U. North Dakota) **Multidimensional scale analysis of work-tasks.** *Proceedings of the Annual Convention of the American Psychological Association*, 1971, Vol. 6(Pt. 1), 117-118.—5 male and 5 female undergraduates estimated similarity (on a 0-100 scale) for pair-comparisons of 20 different work-tasks. These judgmental data were analyzed using the new Stone-Coles methodological modification of Ekman's method of similarity analysis. Separate male and female judgmental stances were identified by a points-of-view analysis. Both judgmental stances were each associated with 5 extracted evaluation dimensions (some monopolar and some bipolar) which accounted for large portions of the judgmental variances (77 and 80%). Almost all of these dimensions were readily interpretable, i.e., they were psychologically meaningful.—*Author abstract.*

2062. Wells, Donald G. & Fruchter, Benjamin. (U. Tennessee, Martin) **Correcting the correlation coefficient for explicit restriction on both variables.** *Educational & Psychological Measurement*, 1970(Win), Vol. 30(4), 925-934.—Presents formulae for correcting the correlation coefficient when (a) the predictor is restricted and the restricted S_x and r and unrestricted S_y are known; (b) the predictor is restricted and the restricted S_x and r and unrestricted S_y are known; and (c) both predictor and criterion are known and r and the restricted and unrestricted S values are known. An example illustrates the use of the methods.—*N. M. Chansky.*

Factor Analysis

2063. Gorsuch, Richard L. (George Peabody Coll. for Teachers) **A comparison of biquartimin, maxplane, promax, and varimax.** *Educational & Psychological Measurement*, 1970(Win), Vol. 30(4), 861-872.—Compares several factor analytic rotational techniques. Criteria were simplicity, measurement ease, and replicability. Data were the ratings by 517 college students of "God" on a 91-item questionnaire. The correlations were factor analyzed using 4 rotational procedures. All procedures produced similar solutions. Oblique procedures produced more simplicity, ease, and generalizability than did varimax. The most efficient oblique procedure was the promax.—*N. M. Chansky.*

2064. Nesselroade, John R. & Balties, Paul B. (West Virginia U.) **On a dilemma of comparative factor analysis: A study of factor matching based on random data.** *Educational & Psychological Measurement*, 1970(Win), Vol. 30(4), 935-948.—Several approaches to the study of factor invariance have been proposed. Recently, an attempt was made to examine the sampling distributions of 1 such statistic, the similarity coefficient. In the present study, a computer generated the similarity coefficient. In an analysis of variance design these were studied as a function of sample size, number of extracted

factors, and number of variables. Strength of association was determined by omega squared. Number of extracted factors became stronger with decreasing similarity, and number of variables became stronger with increasing similarity. Thus, similarity coefficients from real data may be contrasted with those from random data until a stronger test is devised.—*N. M. Chansky.*

COMPUTERS & PROGRAMING

2065. Bernstein, Noel. (U. Pennsylvania, Moore School of Electrical Engineering) **Quintupling the speed of the PDP-8 DF32 disk system for real-time use.** *Behavior Research Methods & Instrumentation*, 1971(Mar), Vol. 3(2), 92-94.—Notes inefficiencies in the operation of the DF32 hardware/software disk system on the PDP-8. While such inefficiencies are not significant when the disk is used only as a store for programs which are called into core from the keyboard, they become important when the disk is used as a real-time backup for core. Some of the problems, rules for avoiding them, and a description of how the system software was modified to obey these rules are noted. The speed of the modified system is noticeable even when SAVEing and CALLing programs from the keyboard: successive blocks can be transferred between disk and core in $\frac{1}{5}$ the previously required time.—*Journal abstract.*

2066. Cancro, Robert & Slotnick, Daniel L. (U. Connecticut, Hartford) **Computer graphics and resistance to technology.** *American Journal of Psychotherapy*, 1970(Jul), Vol. 24(3), 461-469.—Discussed the scientific importance in interpreting computer output. The value of graphics could not be seen in an effective man-machine relationship. It is hypothesized that the man-machine relationship is a stressful situation and that man's psychological needs are involved. Evidence is presented to suggest that the use of graphics played an anxiety reducing role. Although graphics may eventually demonstrate scientific value, a definite need to reduce the anxiety level exists. Only then will an effective man-machine interworking be established.—*C. O'Donnell.*

2067. Churchill, Stacy; Naess, Lars, & Olivier, William P. (Ontario Inst. for Studies in Education, Toronto, Canada) **CAN-4, an advanced author language for CAI, computer-based testing and psychological experimentation: PDP-9 implementation.** *Behavior Research Methods & Instrumentation*, 1971(Mar), Vol. 3(2), 95-99.—The effective use of computers for tutorial (programed instruction) teaching and on-line testing requires that curriculum authors have powerful special-purpose languages. 1 such language, CAN-4, has been designed and implemented to run on the PDP-9. The language includes advanced scoring, data recording, computation, timing, and file control facilities. The language and its implementation are described in relation to the instructional problems which the facilities are designed to meet.—*Journal abstract.*

2068. Cox, Brad. (U. Chicago) **Simulation of neural sets.** *Behavior Research Methods & Instrumentation*, 1971(Mar), Vol. 3(2), 81-84.—Describes a program written for the PDP-8/I computer which simulates the behavior of 64 model neurons which may be connected together to form a functional neural net. The simulation includes provisions for studying the possible mechanisms of learning in real systems. Operation of the net requires

inputs from either a robot or a robot simulator program and output from the net serves as input to such a robot, so that the entire system investigates the behavior of an organism and its brain in interaction with an environment.—*Journal abstract.*

2069. Eaves, L. J. (U. Birmingham, England) **The genetic analysis of continuous variation: A comparison of experimental designs applicable to human data: II. Estimation of heritability and comparison of environmental components.** *British Journal of Mathematical & Statistical Psychology*, 1970(Nov), Vol. 23(2), 189-198.—Applied a method of computer simulation for comparing the relative efficiencies of alternative experimental designs to the study of the efficiency with which broad heritability can be estimated and the 2 main sources of environmental variation separated in data from human populations. 2 minimal sets of data (each composed of 3 groups of related pairs of individuals: monozygotic twins reared together and apart and full siblings reared together) were compared with respect to these criteria, and the effects of varying the proportions of the groups of relatives comprising a set were investigated. The relationship between efficiency, the level of broad heritability and the degree of dominance is noted, and results related to those of a previous study.—*Journal abstract.*

2071. Kletsky, Earl J. (Syracuse U., Lab. of Sensory Communication) **A six-channel PDP-8 interface for nerve impulse data.** *Behavior Research Methods & Instrumentation*, 1971(Mar), Vol. 3(2), 85-87. Presents an interface operating on the input output (I/O) bus of the LINC-8, which accepts up to 6 channels of nerve impulse data simultaneously at rates up to 4000 pps. By means of a 100-kHz clock and a 17-bit counter, the time of occurrence of each nerve impulse is strobed into 1 of 6 17-bit buffer registers. The strobe causes a program interrupt to occur. 2 I/O instructions are used to read the buffers into the PDP-8 accumulator. Additional instructions for skipping on data or overflow, enabling the counter, clearing the overflow flag, and clearing the counter are available. *Journal abstract.*

2072. Kuehl, Frederick W. **Evaluation of a multiplicative generator of pseudo-random numbers.** *U.S. Army BESRI, Technical Research Note*, 1969(Sep), No. 215, 24 p.—Reports on the development and testing of a pseudo-random number generator which would be able to rapidly supply the SIMPO-1 entity models with numbers meeting essential tests for random qualities. The generator developed is a power residue or multiplicative generator, the simplest of the many generators based on the linear congruential method. In addition to an acceptable generator, the work accomplished resulted in a compilation of statistical tests which have wider application for evaluating generators used on other computer systems. The tests are described, and essential mathematical formulations are presented. *A. J. Drucker.*

2073. Lauer, George. (North American Rockwell Corp., Science Center, Thousand Oaks, Calif.) **A real-time multiuser foreground, single-user background system for the PDP-9 computer.** *Behavior Research*

Methods & Instrumentation, 1971(Mar), Vol. 3(2), 103-105.—Describes a software system for a PDP-9, with fixed head disk, developed to allow up to 16 remote laboratories to use the central PDP-9 facility for their experimental data acquisition and control needs. Time-sharing is performed on a "demand" basis, using the hardware automatic priority-interrupt option. The real-time acquisition and control aspects are separated from the data reduction in the foreground by using a batch process foreground mainstream. The background is used primarily as a systems device for program updates and communications with a Control Data Corporation (CDC) terminal connected to a CDC 6600 computer. The philosophy, both software and hardware, developed for this heterogeneous user environment is discussed.—*Journal abstract*.

2074. Lewis, J. L., Boies, S. J., & Osgood, G. W. (U. Oregon) **Zoroaster: A multiprogramming system for psychological research.** *Behavior Research Methods & Instrumentation*, 1971(Mar), Vol. 3(2), 106-107.—The development of a multiprogramming system for psychological research was undertaken on a PDP-9 computer with 8K memory. The needs of the users and the time demands on the computer raised several important questions: (a) Can a practical-timesharing system be developed with only 8K memory? (b) Can critical timing functions be maintained? (c) Can easy access be provided (e.g., FORTRAN) to all experimental devices? (d) Can a system be designed which will take advantage of and be compatible with most of the standard DEC-provided software (e.g., FORTRAN compiler, loader)? The system was successfully developed by using a rapid within-core swapping technique, standard input/output routines, many general-purpose handlers and subroutines, and fully utilizing available core.—*Journal abstract*.

2075. Lidorenko, N. S. **Fizicheskie modeli évristsicheskogo programmirovaniya v kibernetike.** [Physical models of heuristic programming in cybernetics.] *Vestnik Akademii Nauk SSSR*, 1970(Nov), Vol. 40(11), 53-58.—Discusses theoretical and experimental studies in the electronics of the liquid body, and the construction of instruments and devices with ionic carriers of information. These studies show great promise for the development of rational methods to create physical models of the adaptive self-organizing elements and schemata of cybernetics—models which respond optimally to the heuristic method of image-recognition whereby useless solutions are weeded out and useful information is introduced into the program.—*J. D. London*.

2076. Michie, Donald. (U. Edinburgh, Experimental Programming Unit, Scotland) **Future for integrated cognitive systems.** *Nature*, 1970(Nov), Vol. 228(5273), 717-722.—Describes the present and projected capabilities of machine (computer) intelligence and compares the information handling powers of brain and computer. Designs and applications of intelligent computer systems are described. It is argued that limitations in computer intelligence lie more in the "inadequate understanding of mathematical-logical and programming principles . . . than in hardware speeds or storage capacities." (24 ref.)—*S. Appelle*.

2077. Schwenn, Peter T. (U. Wisconsin, Medical Center) **"Time," a time sharing monitor for the DEC LINC-8, PDP-8, and PDP-12.** *Behavior Research Methods & Instrumentation*, 1971(Mar), Vol. 3(2), 100-102.—A

system is available for an 8K, or larger, LINC-8, PDP-8, or PDP-12 with RF/RS08 disk(s), to allow virtually simultaneous execution of any mix of PDP-8 and/or LINC programs. The programs need little or no modification to run within "Time," and up to 8 may be in the mix at a given time. Time also incorporates a file system with access and write protection. The system is intended to be used with conversationally oriented programs. Time is in the public domain.—*Journal abstract*.

2078. Scott, D. E. & Dzendolet, E. (U. Massachusetts) **The PDP-8/I as a CAT.** *Behavior Research Methods & Instrumentation*, 1971(Mar), Vol. 3(2), 79-81.—Describes a programed algorithm to compute a weighted ensemble average on a set of output signal realizations. Thus programed, the PDP-8/I can recover output signals, which are due to periodic input signals, from a noisy system. Arbitrarily, large enhancement of signal-to-noise ratio is attainable. The configuration used is a 4K PDP-8/I with AD08-B analog-to-digital converter.—*Journal abstract*.

2079. Singleton, James W. & Drutz, Aaron. **Interface: Man and machine: Two scientists look ahead.** *Perspectives in Defense Management*, 1969(Jun), 27-35.—Distinguishes between the fundamental attributes of man and machine. Technological developments and future possibilities are discussed. The myths of depersonalization, society as a homogenized mass, and man's volitional control over the environment are discussed. Order, precision, and consistency are necessary in man's relationship with computers. Machine utilization is emphasized. It is concluded that "the problem is feeding the machine" the correct up-to-date data. The use of computers in military operations is presented.—*G. Steele*.

2080. Thomas, P. A. & Balatoni, N. (U. Windsor, Ontario, Canada) **A hardware multiplier/divider for the PDP 8S computer.** *Behavior Research Methods & Instrumentation*, 1971(Mar), Vol. 3(2), 89-91.—Outlines the design of a multiplier/divider being developed for the PDP-8/S. The unit will carry out the required function on 2 12-bit signed numbers (using 2's complements for negative numbers) and produce a correctly signed result. All data transfers will be through the programed input/output (I/O) channel, no data break facility being required. The estimated time taken for the operations is 96 microsec. for multiplication and 176 microsec. for division, which is considered reasonable in comparison to the I/O times of 38 microsec. The total material cost is estimated at \$1500. Some variations of the basic unit are also discussed.—*Journal abstract*.

TESTING

2081. Blumetti, Anthony & Satz, Paul. (U. Florida) **Cost efficiency and test prediction: A reformation.** *Proceedings of the Annual Convention of the American Psychological Association*, 1971, Vol. 6(Pt. 1), 107-108.—Points out the limitations of Rimm's cost efficiency formula for use in test prediction by the fact that the formula assumes that classification by base rates alone always leads to false negative errors. A new cost efficiency formula is generated to be used in those cases in which false positive errors ensue by the use of base rates for prediction. Examples are given which demonstrate quantitative differences between the formulas which could lead, in certain conditions, to costly decision errors in clinical prediction.—*Author abstract*.

2082. Garvin, Alfred D. (U. Cincinnati) **Non-chance results from a pure-chance test: A study in response-position selection set.** *Proceedings of the Annual Convention of the American Psychological Association*, 1971, Vol. 6(Pt. 1), 99-100.—Investigated response-position selection set in multiple-choice (MC) and true-false (TF) tests. 73 undergraduates simply guessed the "answers" to a nonexistent test comprising 25 5-choice MC items and 10 TF items. Responses were "scored" against a key that was quasi-random for the MC items but contrivedly counterintuitive for the TF items, e.g., F, F, T, F.... Response-position selections on MC items departed markedly from a rectilinear distribution. TF response-position selections generally conformed to a hypothesized sequence, i.e., T, T, F, T... resulting in a TF subtest mean of 3.71 vs. an expected 5.00. ($p < .001$). The importance of random response-position test keying is discussed.—*Author abstract.*

2083. Hambleton, Ronald K., Rovinelli, Richard, & Gorth, William P. (U. Massachusetts) **Efficiency of various item-examinee sampling designs for estimating test parameters.** *Proceedings of the Annual Convention of the American Psychological Association*, 1971, Vol. 6(Pt. 1), 103-104.—Systematically investigated the effect of number of items, number of subtests, number of examinees, total number of observations, and the shape of the test score distribution on the accuracy of estimating test parameters for a population of examinees. The study was conducted using artificially generated data. Results suggest that the number of observations is particularly important. Also, apparently the shape of the test score distribution has no effect on the usefulness of various item-examinee sampling designs. Finally, it would appear that for a fixed number of observations it may be possible to improve the accuracy by trading off items for more examinees.—*Author abstract.*

2084. Koson, D., Kitchen, C., Kochen, M., & Stodolosky, D. (U. Michigan, Mental Health Research Inst.) **Psychological testing by computer: Effect on response bias.** *Educational & Psychological Measurement*, 1970(Win), Vol. 30(4), 803-810.—68 paid college student volunteers were randomly selected to rate possible questionnaire items ($n = 20$), to respond to the questionnaire in the presence of E ($n = 16$), to respond verbally to the questionnaire read by E ($n = 16$), and to respond to a cathode ray tube, connected to a computer in the presence of no one ($n = 16$). Results indicate no significant differences in scores between the methods for honesty scores, threat scale; defensiveness scores, K scale; or neutral scores, threat rating or proportion of true scores.—N. M. Chansky.

2085. Reckase, Mark D. & Gardner, Eric F. (Syracuse U.) **Comparisons of the stability of Thurstone's absolute scaling method and Flanagan's system of scaled scores.** *Proceedings of the Annual Convention of the American Psychological Association*, 1971, Vol. 6(Pt. 1), 113-114.—Made 3 comparisons between Thurstone's method of absolute scaling (TMAS) and Flanagan's method of absolute scaling (FSSS) using 2 subscales of the Stanford Achievement Test. The comparisons were between (a) stability of derived scales when the equating percentile equating base test was varied, (b) stability of derived scales when the number of groups used was varied, and (c) a plot of the derived scales against raw scores for the 2 methods. TMAS was found to be more stable on Comparison a, no substantial differences were

found on b, and c showed that the derived scales for TMAS and FSSS were generally similar.—*Author abstract.*

2086. Walker, Elaine. (Sydney Technical Coll., New South Wales, Australia) **Prediction Index Scores.** *Australian Psychologist*, 1969(Nov), Vol. 4(2-3), 187-192.—Asserts that to be effective as a predictive device, a test must classify individuals more accurately than the base predictive rate. The algorithm developed for Prediction Index Scores (PIS) by P. I. Meehl and A. Rosen is discussed in relation to "cost of treatment" (economic or ethical) and the choice, by psychologists of a cutting score which would increase the proportion of valid positives and negatives with classification based on 1 cutting score. PIS "quantify the proportion of correct classifications in a population with known base rate if a cutting score on a test is placed immediately below the lower limit of the class interval on the test." This procedure is applicable in an educational setting in that the costs to the community involved in training, or failing to train, individuals may be more accurately determined. It is suggested that PIS be included with validity coefficients and other data in all test manuals. A computer program for computation of PIS is currently available.—B. A. Stanton.

Construction & Validation

2087. Barron, Bruce A., Hirsch, Jules, & Glucksmann, Myron. (Rockefeller U.) **The construction and calibration of behavioral rating scales.** *Behavioral Science*, 1970(May), Vol. 15(3), 220-226.—Describes heuristic methods which provide measures of use in the construction and calibration of a rating scale, when used by 2 Os, where there is only 1 opportunity for measurement of the characteristic. Results of these procedures permit an empiric evaluation to be made of the scale as used by the raters. A score is suggested that attempts to evaluate the interchangeability of 1 set of scores with those obtained by another O. These methods provide a basis upon which to initially structure such measuring instruments (16 ref.).—*Journal abstract.*

2088. Boor, Myron V. (Southern Illinois U.) **The construct validity of four measures of intraindividual variability.** *Dissertation Abstracts International*, 1971.(Jan), Vol. 31(7-B), 4326-4327.

EXPERIMENTATION & OBSERVATION

2089. Meuwese, W. (Technological U. Eindhoven, Netherlands) **Een vergelijking van twee methoden van beoordeling van verbale stimuli.** [A comparison of two methods of judging verbal stimuli.] *Nederlandsche Tijdschrift voor de Psychologie en haar Grensgebieden*, 1970(Oct), Vol. 25(9), 594-603.—Names of 15 fields of science were judged pair wise in terms of similarity by 44 mature Ss at a technical school. The similarity of pairs of stimuli were judged on an 11 point scale ranging from "no difference" to "very different." Then the sciences were rated on 21 7-point qualitative scales by adjectives, such as "superficial-profound." The similarity judgments were analyzed by Kruskal's method. The nonmetric multidimensional analysis consisted of 4 dimensions: humanistic-materialistic, difficult and exact-easy and inexact, alpha (history and literature)-beta (biology and mathematics), and practical-mental. The adjective scales were analyzed by a 3-mode factor analysis: evaluative,

utility, and "exactitude." Structures of these analyses were related by canonical and multiple regression. Apparently the structure developed by the adjective scales was highly predictable from the similarity structure. Also the mean ratings on the adjective structure were predictable from the projections of the stimuli on the dimensions of the similarity structure. (English summary)—*A. J. Ter Keurst.*

2090. Neulinger, John & Stein, Morris I. (City Coll., City U. New York) **Personality characteristics of volunteer subjects.** *Perceptual & Motor Skills*, 1971-(Feb), Vol. 32(1), 283-286.—2 personality types, the socially oriented and the intellectually oriented, represented among 549 female college undergraduate volunteers, showed differential rates of volunteering in favor of the intellectually oriented type. The personality dynamics of these types accord well with findings reported in the literature regarding the characteristics of volunteers and nonvolunteers. The need for a systematic consideration of personality bias in sampling was pointed to.—*Journal abstract.*

2091. Restle, Frank & Levison, Moshe. (Indiana U.) **Method of constant stimuli: Invalidity to the third power.** *Perception & Psychophysics*, 1971(Mar), Vol. 9(3-A), 312-314.—A description of deficiencies in the method of constant stimuli, published by M. Levison and F. Restle (see PA, Vol. 42:16441), was criticized as logically invalid by R. Sekuler and A. Erlebacher, who then interpreted the findings as the result of a tendency to use available responses equally often. Sekuler and Erlebacher erroneously thought that the comparison adaptation-level (CAL) theory described the frame of reference for judgments. Correctly interpreted, the theory presents no logical difficulties. An experiment with 49 undergraduates compared this frame-of-reference interpretation of CAL with the Sekuler-Erlebacher response-bias theory. Results agree in detail with CAL theory and are in direct opposition to the response-bias interpretation. Although the Sekuler-Erlebacher hypothesis is logically possible, it does not seem to be empirically true.—*Journal abstract.*

2092. Sekuler, Robert & Erlebacher, Albert. (Northwestern U.) **The invalidity of "invalid results from the method of constant stimuli": A common artifact in the methods of psychophysics.** *Perception & Psychophysics*, 1971(Mar), Vol. 9(3-A), 309-311.—Demonstrates that a description by M. Levison and F. Restle (see PA, Vol. 42:16441) of deficiencies in the method of constant stimuli is logically in error. Their data, as well as those from other experiments, are interpretable in terms of a response bias that may distort data in a variety of psychophysical studies. This bias is the tendency of Ss to use available responses with equal frequency. (15 ref.)—*Journal abstract.*

2093. Suboski, Milton D. & Tait, Robert W. (Queen's U., Kingston, Ontario, Canada) **The relationship between classical conditioning and sensory preconditioning.** *Proceedings of the Annual Convention of the American Psychological Association*, 1971, Vol. 6(Pt. 1), 31-32.—Review of the evidence reveals extensive similarities between classical conditioning and sensory preconditioning (SPC) in terms of the effect of comparable experimental manipulations. Classical conditioning and SPC are similar in acquisition and extinction, interstimulus interval functions, effects of partial reinforcement and discrimination conditioning, and in several other respects. The operational definition

of classical conditioning requires that the UCS reliably elicit a response whereas SPC occurs whether an effective UCS is used in preconditioning or not. Thus, SPC is clearly a more general phenomenon which includes classical conditioning as a special case.—*Author abstract.*

APPARATUS

2094. Elias, Merrill F., Blenkarn, G. Douglas; Simmerman, Scott J., & Marsh, Gail R. (Duke U., Medical School, Center for the Study of Aging & Human Development) **Administration of inhalation anesthetics to small animals: Some problems and solutions.** *Behavior Research Methods & Instrumentation*, 1971-(Mar), Vol. 3(2), 70-71.—Discusses problems inherent in administering inhalation anesthetics to small laboratory animals in studies of memory consolidation. A simple and inexpensive apparatus which has been designed to eliminate some of these problems is described and its use illustrated through an experiment with male mice anesthetized once/day for 30 consecutive days.—*Journal abstract.*

2095. Rugh, John D. (U. California, Santa Barbara) **A telemetry system for measuring chewing behavior in humans.** *Behavior Research Methods & Instrumentation*, 1971(Mar), Vol. 3(2), 73-77.—Describes a system for detecting and recording human chewing behavior. A small transmitter mounted in the side frame of eyeglasses was used to detect muscle movement associated with chewing in 4 undergraduates. The transmitter signal was received and converted to a DC voltage which varied at a rate proportional to the S's chewing movement. Exploratory data are presented which suggest that individuals chew at about the same rate/sec, but vary in the total number of chews emitted to consume the same amount of foodstuff.—*Journal abstract.*

EXPERIMENTAL PSYCHOLOGY

2096. Balogh, Jenő. (National Academy of Fine Arts, Budapest, Hungary) **Az érzéki ítélet pszichológiája és helye az emberi gondolkodásban és cselekvésben.** [The psychology of sensual judgment and its place in human thinking and action.] *Pszichológiai Tanulmányok*, 1967, No. 10, 173-174.

2097. Brown, L. B. & Fuchs, A. H. (Victoria U., Wellington, New Zealand) **The letters between Sir Thomas Hunter and E. B. Titchener.** *Victoria University of Wellington Publications in Psychology*, 1969, No. 23, 4-60.—Experimental psychology had an early start in New Zealand, but the process of separating it from philosophy, of founding a laboratory, attracting students, and developing a research tradition, was gradual. In the development, experimental psychologists had to overcome the attitudes of philosophers and the antagonism of the nonexperimental tradition in Britain. Course changes that were contrary to prevalent British views had little chance of approval. Curriculum revision was also difficult. Sir Thomas Hunter's role as pioneer consisted of introducing laboratory work to the teaching of psychology, and working toward experimental psychology as a separate discipline. He devoted much energy to clearing the obstacles which stood in his way, and worked within the University system for reform, which was eventually implemented. E. B. Titchener

encouraged Hunter's efforts in a lengthy correspondence. He was sympathetic to Hunter's difficulties, since he had himself reacted against the British tradition in psychology. His own stance and experience constituted a model for Hunter, and in this way Titchener contributed to the spread of experimental psychology, beyond simply bringing Wundtian psychology to America. 2100. Sagal, A. A. (Inst. of Evolutionary Physiology & Biochemistry, Moscow, USSR) **O rasshirenii oblasti opredeleniya chuvstvitel'nosti.** [Widening the scope of sensitivity determination.] *Doklady Akademii Nauk SSSR*, 1970, Vol. 195(6), 1476-1478.—To widen the scope of sensitivity determination it is enough to assume that sensitivity exists whenever experimental determination of the conditional random values of a stimulus takes place, if these values are determined by the particular experimental methodology and the stimulus is producing any type of response caused by some underlying physiological process. In distinction from the classical psychophysical thresholds, thresholds calculated by taking into account this assumption are called generalized thresholds. Data are presented showing analogous sensitivity and information gain curves for qualitatively different situations: recognition of simple signals, simple classical conditioning, and identification of complex auditory signals. The concept of the generalized threshold permits a unified study of higher nervous activity and the quantitative comparison of 2 of its characteristics, sensitivity and information transmission, under a variety of experimental conditions. *L. PERCEPTION

2102. Davidson, Elmer H. & Robertson, Colin L. (U. North Carolina, Wilmington) **Perceptual search time as a function of association value with practice effects controlled.** *Psychonomic Science*, 1970(Dec). Vol. 21(6), 317-318.—Investigated the effects of association value (AV) on perceptual search time in a design to control practice effects. 40 undergraduates were each exposed to 4 lists of trigrams (field) with instructions to find a particular 1 (target). No S experienced more than 1 level of each factor of the $2 \times 2 \times 4$ design. There were 2 AV levels of the target trigrams, 2 AV levels of the field list of trigrams, and 4 target positions. As expected, perceptual search time increased as the target was moved down the list. Results support the hypothesis that AV reduces perceptual search time when the field and target have different AV. It is concluded that practice effects and perhaps S's failure to retain the targets of low AV during his search had influenced the results of previous studies.—*Journal abstract.*

2105. Reynolds, Richard E. & Giambra, Leonard M. (Miami U.) **Information transmission in bidimensional stimuli as a function of degree of correlation between nonintegral dimensions.** *Proceedings of the Annual Convention of the American Psychological Association*, 1971, Vol. 6(Pt. 1), 75-76.—Investigated the hypothesis that increasing the dimensionality of stimuli in a perfectly correlated manner can increase information transmission when dimensions are nonintegral and perceptually independent. 40 Ss served in 1 of 3 experimental groups and a control group. Each S made 500 absolute judgments of 20 unidimensional stimuli and 500 judgments of 20 bidimensional stimuli. Dimensions in the bidimensional stimuli were (a) perfectly linearly correlated, (b) partially linearly correlated, or (c) uncorrelated. Increased dimensionality, even if the correlation between dimensions is perfect, increases information transmission, but type of correlation is not shown to be important.—*Author abstract.*

Illusion

2106. Dockstader, Steven L. (Denver U.) **Comparison of cupulometric and psychophysical thresholds for perception of rotation and the oculogyral illusion.** *Perception & Psychophysics*, 1971(Mar), Vol. 9(3 A), 299-302. Compared thresholds for angular acceleration derived by subjective cupulometry and by a staircase method. Thresholds for the perception of rotation and the oculogyral illusion were determined for 10 male 21-40 yr. old Os who were rotated about their vertical axis. The cupulometric thresholds were significantly higher, more variable and not predictable from the staircase thresholds. Furthermore, cupulometry failed to distinguish between the thresholds for the perception of rotation and the oculogyral illusion, although both indicators functioned according to the prediction of the underlying linear model. Individual differences support the conclusion that cupulometric thresholds bear no relationship to the sensory threshold derived in a classical psychophysical manner (16 ref.) *Journal abstract.*

2107. Luccio, Riccardo. **Il massimo temporale dell'illusione di Ponzo negli adulti.** [The temporal maximum of Ponzo's illusion in adults.] *Bollettino di Psicologia Applicata*, 1969(Aug), No. 94-96, 55-61. Studied 18-22 yr. old undergraduates, who were divided into 4 groups of 16 and tested with a tachistoscope. Each group tried only once with both ascending and descending series. The distance between Ss and stimulus was 26 cm. The time allotted was .05, .04, .02, and .01 sec. The temporal maximum of optical geometrical illusions. The results and in the understanding of the optical geometric illusions, which can not be considered a particular case of the perception of space but which

may help in understanding the general laws which govern it. (English & French summaries)—*A. M. Farfaglia*.

2108. Luccio, Riccardo & Massimini, Fausto. **Costanza di grandezza e illusioni ottico-geometriche.** [Constancy of magnitude and optic-geometric illusions.] *Bollettino di Psicologia Applicata*, 1969(Aug), No. 94-96, 63-90.—Reviewed the literature related to the theory of the constancy of magnitude in A. Gregory's optic geometric illusions. Reference is made also to the ecological theory of M. Segall, D. Campbell, and M. Herskovits. Gregory distinguishes between 2 different processes: primary and secondary constancy scaling. It is concluded that in the discussion by others of Gregory's theory, the evolutionary factors were not considered; thus, the theory appears less simple, but also less complete than expected. (English & French summaries) (5 p. ref.)—*A. M. Farfaglia*.

2109. Pressey, A. W. (U. Manitoba, Winnipeg, Canada) **An extension of assimilation theory to illusions of size, area, and direction.** *Perception & Psychophysics*, 1971(Feb), Vol. 9(2-A), 172-176.—2 postulates, 1 concerning assimilation and 1 concerning attentive fields, are employed to explain the Ponzo, Poggendorff, Wundt, and Hering illusions. Several new configurations are predicted from the theory. In addition, changes in the magnitude or direction of illusion which result from alterations of the basic illusion are explained.—*Journal abstract*.

2110. Quina, Kathryn & Pollack, Robert H. (U. Georgia) **Parametric investigation of the Ponzo illusion under conditions of tachistoscopic exposure.** *Proceedings of the Annual Convention of the American Psychological Association*, 1971, Vol. 6(Pt. 1), 77-78.—Studied the influence of the Ponzo wedge tachistoscopically by presenting a test line at different positions relative to its apex to 2 trained Ss. Lines at positions near the apex were overestimated, and lines further out were underestimated. Results suggest that the classical Ponzo illusion is made up of 2 separate illusions, an overestimation caused by dominant assimilation forces and an underestimation due to dominant contrast effects.—*Author abstract*.

Time

2111. Adorjáni, Csaba. (Hungarian Academy of Sciences, Inst. of Psychology, Budapest) **A valószínűségi modellezés néhány kérdéséről az invariáns mozzanatok percepciójában.** [Some problems of probability models in the perception of invariant moments.] *Pszichológiai Tanulmányok*, 1967, No. 10, 101-119.

2112. Fillenbaum, Samuel. (U. North Carolina, Chapel Hill) **Syntactic locus as a determinant of judged pause duration.** *Perception & Psychophysics*, 1971(Feb), Vol. 9(2-B), 219-221.—Attempted to determine if the syntactic location of a speech pause might affect its apparent duration. 67 undergraduates listened to a continuous discourse, being required to attend to its content as well as to make judgments, now and then, as to the duration of particular pauses. For pauses all actually of the same length, it was found that those falling at a minor within-sentence break, as syntactically defined, were characteristically judged to be longer than those falling at a major within-sentence break or at a between-sentence break, with no difference between the 2 latter cases. These results, obtained in a perceptual task

involving a minimum of extraordinary or disruptive features, are taken as evidence for the power of syntactic variables in affecting attention during listening to speech.—*Journal abstract*.

2113. McConchie, Richard D. & Rutschmann, Jacques. (U. Paris, Medical Faculty, France) **Human time estimation: On differences between methods.** *Perceptual & Motor Skills*, 1971(Feb), Vol. 32(1), 319-336.—Using the same 8 standard intervals (ranging from 300-1000 msec. in 100-msec steps), 16 males made reproductions, verbal estimates, and productions in randomized blocks of trials according to a fixed complex order (sequence of methods, presentation of anchors). After presentation of anchors, significant differences between methods were still in evidence with respect to accuracy, and intra- and inter-S variability. The reliability of verbal estimates and of productions was decreased upon presentation of anchors, but in all methods, reliability increased over blocks of trials. Reliability of estimations and productions was significantly correlated with relative inter-S variability. As to association between judgments, verbal estimates and productions showed negative correlation while inter-correlations involving reproductions were not significant. A method involving a random-per-trial sequence of methods and standards is proposed for further studies.—*Journal abstract*.

VISION

2114. Baumstirler, Y. & Parrot, J. (Centre National de la Recherche Scientifique, Centre d'Etudes Bioclimatiques, Strasbourg, France) **Stimulus generalization and spontaneous blinking in man involved in a voluntary activity.** *Journal of Experimental Psychology*, 1971(Apr), Vol. 88(1), 95-102.—Presented 10 male undergraduates with a multiple-choice paced task. The occurrence of spontaneous blinks was studied in its temporal relation with onset of the stimulus and achievement of the motor response. An inhibition of blinking appears to be set up before onset of the stimulus. In most cases, this inhibition is released by the achievement of the motor response. When a stimulus is transformed into a negative 1 by addition of an inhibition instruction, response times show a generalization of the inhibition. The same law of generalization is followed by spontaneous blinking, the inhibition of which is more important when the stimulus is nearer to the negative 1. (20 ref.)—*Journal abstract*.

2115. Dewar, Robert. (U. Calgary, Alberta, Canada) **Adaptation to displaced vision: Variations on the "prismatic-shaping" technique.** *Perception & Psychophysics*, 1971(Feb), Vol. 9(2-A), 155-157.—Measured adaptation to displaced vision using 3 variations on Howard's "prismatic shaping technique." Ss were male volunteers from a Canadian jail. Over a series of 40 trials, a lateral displacement of 11.3° was introduced either gradually or suddenly. Both the amount of adaptation (negative aftereffect) and the accuracy of target localization at the completion of 40 trials were found to be directly related to the "suddenness" with which the displacement was introduced.—*Journal abstract*.

2116. Earle, D. C. & Lowe, G. (U. Hull, England) **Channel, temporal, and composite uncertainty in the detection and recognition of auditory and visual signals.** *Perception & Psychophysics*, 1971(Feb), Vol.

9(2-A), 177-181.—In a 2AFC detection task, channel and temporal uncertainty were separately shown to produce decrements in the detectability of auditory and visual signals. The observed effect of channel uncertainty suggests that Ss are capable of using an "attentional" or "performance-compensation" strategy. This finding is discussed in relation to a "multiple-observation" model for channel uncertainty. Recognition measures were taken where appropriate and gave some support to the hypothesized attentional strategy. Under composite uncertainty conditions both types of uncertainty were presented simultaneously; results indicate that any interaction effect was small, relative to the separate effects of channel and temporal uncertainty.—*Journal abstract.*

2117. Finn, John P. & Lit, Alfred. (Southern Illinois U.) Effect of photometrically matched wavelength on simple reaction time at scotopic and photopic levels of illumination. *Proceedings of the Annual Convention of the American Psychological Association*, 1971, Vol. 6(Pt. 1), 5-6.—RT responses were obtained from 3 normal Ss over a wide illumination range for white and colored stimuli photometrically matched at each level. RT vs. retinal-illumination curves for white and colored stimuli showed that at low levels, RT was high, but, with increasing illumination, RT progressively decreased to reach a final low asymptotic value. Each curve showed a discontinuity at about $-1.25 \log I$. Curves representing different wavelengths essentially overlapped throughout the entire scotopic and photopic range, at mesopic levels. RT to red stimuli tended to yield lower responses than to any other wavelength. These data are interpreted in terms of the relative activity of the rod and cone systems at each illumination level.—*Author abstract.*

2118. Haines, Richard F. (Ames Research Center, NASA Moffet Field, Calif.) The retinal threshold gradient in the presence of high luminance target and in total darkness. *Perception & Psychophysics*, 1971(Feb), Vol. 9(2-B), 197-202. Measured the retinal threshold along the horizontal meridian for the dark-adapted eye and for the same retinal region light-adapted by stray light from a small foveally fixated high luminance target. This was done to quantify the irradiation phenomenon in the foveal-parafoveal boundary region. 2 target luminances were investigated (8531 and 13,000 ft-L). 7 Ss made threshold settings using a variable-intensity test spot whose retinal image was located at various angular separations from the foveal center as far as 10° in the temporal field. Threshold slopes were steeper for test spots imaged from $15'$ to 1° of arc from the foveal center than for spots imaged from 1° to $15'$ of arc from the foveal center for the illuminated target conditions. The angular distance between the fovea and the intersection of the steep component with the shallow component of each threshold curve tended to shift toward the target's edge with an increase in target luminance. These data are interpreted as an indication that a dynamic neural mechanism is involved in producing the irradiation phenomenon (39 ref.)—*Journal abstract.*

2119. Kelly, D. H. (Stanford Research Inst. Menlo Park, Calif.) Theory of flicker and transient responses: I. Uniform fields. *Journal of the Optical Society of America*, 1971(Apr), Vol. 61(4), 537-546.—Explains photopic flicker data in terms of a theoretical model of 2 retinal processes. The 1st is a linear diffusion process (presumably in the receptors), with a large

dynamic range ($\sim 10^5$). The 2nd is a nonlinear inhibiting network (neural feedback at the synapses of the plexiform layers) that adaptively controls the sensitivity and time constants of the model. The importance of its transfer function fits the flicker data quantitatively at all frequencies, over a wide range of adaptation levels. The corresponding small-signal impulse responses are also calculated. Their latencies and leading edges (associated with receptor activity) are invariant with adaptation level; the remaining phases of these transient waveforms (associated with the graded potentials of secondary neurons) adapt strongly, in accord with current findings and microelectrode findings (17 ref.)—*Journal abstract.*

2120. Smith, Gudmund J. & Spohlm, Lena. (Inst. Psychological Lab., Sweden.) Projected afterimages after manipulation of cognitive schemes in adults. *Psychological Research Bulletin*, 1971, Vol. 10(15), 12 p.—Presented different afterimage (AI) theories to 14 pairs of 21-yr-old males matched for general intelligence and educational background. 1 S in each pair was told that AIs are almost exclusively determined by subjective factors, and the other S was told that AIs are controlled by the environment, and that they scarcely differ from test objects. In a subsequent experiment with a projection distance 1.5 times the stimulation distance the latter S reported smaller AIs than Emmert size and positive hues, whereas the former S, i.e., the one who had been told that AIs are almost exclusively determined by the environment, reported larger AIs from the surrounding physical reality. It was concluded that the AIs obtained were affected by the Ss' conceptions of these phenomena in relation to himself and the outside world.—*Journal abstract.*

2121. Tong, J. L. & Ground, D. (All. of Psychology, Ontario, Canada) Rigidity and instructions in relation to two-flash fusion measures. *Psychonomic Science*, 1970(Dec), Vol. 21(6), 355-356.—It has been suggested that scores from constant-stimuli procedures with signal-detection analyses may be influenced by a response-alternation variable termed "rigidity." To test this in connection with the discrimination of two parallel, vertical lines, 16 high- and 16 low-rigidity undergraduates were given both facilitating and inhibiting instructions with the 2-flash fusion task. Signal detection analysis indicated significantly higher threshold measures under both conditions for low-rigidity Ss. Inhibitory instructions raised both threshold and criterion levels for both groups; the low-rigidity group showed the greater criterion shift.—*Journal abstract.*

Perception

2122. Borjesson, Erik H. (Uppsala, Sweden.) Properties of changing patterns evoking visually perceived oscillation. *Perception & Psychophysics*, 1971(Mar), Vol. 10(3A), 173-181. The visual properties of changing patterns evoking visually perceived oscillation were investigated with 20 normal subjects. By using patterns of varying complexity it was found that the amount of perceived oscillation was directly related to the number of elements associated with the direction of change. The rate of perceived oscillation was an apparent function of the complexity of the pattern, and the rate of change was an apparent function of the complexity of the pattern. It was further found that patterns evoking straight edges perpendicular to the axis of movement

with this axis displaced from the middle of the pattern, and patterns with a gradient of texture density were perceived to oscillate more than similar patterns without these properties. Perceived oscillation of ellipses are discussed, and it is concluded that perceived oscillation was a consequence of perceived orientation, which is determined by stimulus properties. (18 ref.)—*Journal abstract*.

2123. Coltheart, Max. (U. Waterloo, Ontario, Canada) **Visual feature-analyzers and aftereffects of tilt and curvature.** *Psychological Review*, 1971(Mar), Vol. 78(2), 114-121.—Explains the aftereffect produced by viewing a line tilted in the frontal plane in terms of the adaptation of orientation-specific units in the visual system. This explanation is more successful than explanations based on "normalization" or "satiation." Aftereffects of curvature or median-plane tilt can be explained in analogous ways, although the visual system units necessary are in this case mainly hypothetical, since experiments capable of demonstrating the existence of these types of units have not yet been performed. (43 ref.)—*Journal abstract*.

2124. Faw, Terry T. & Nunnally, Jum C. (U. California, Los Angeles) **The influence of stimulus incongruity on the familiarity effect in visual selection.** *Perception & Psychophysics*, 1971(Feb), Vol. 9(2-A), 150-154.—A consistent finding in the literature concerning visual selection is that a stimulus exposed to S subsequently loses some of its potential to elicit looking responses. Studies examining the familiarity effect in visual selection have not systematically examined the influence on that effect of various stimulus characteristics possessed by the familiarized stimulus. The present experiments (Ns = 72 undergraduates in Exp. I, and 48 in Exp. II and III) examined the relationship between the magnitude of the familiarity effect and the level of incongruity represented by the familiarized stimulus and found it to be increasing and monotonic. In addition, Exp. III examined the generality of reports that familiarized stimuli are "liked" less than their unfamiliarized counterparts. The ease of explaining the results of the experiments using an "affect change" model of the familiarity effect and an "information-conflict resolution" model of that effect are discussed.—*Journal abstract*.

2125. Kinchla, R.A. (Princeton U.) **Visual movement perception: A comparison of absolute and relative movement discrimination.** *Perception & Psychophysics*, 1971(Feb), Vol. 9(2-A), 165-171.—It is proposed that there are 2 types of visual movement perception, absolute and relative. The former occurs when an object is seen to move in an otherwise homogeneous (or at least locally homogeneous) visual field. Relative judgments occur when 1 object is seen to move with respect to another, i.e., the separation between them is seen to change. Quantitative models for both processes are developed, and an experiment reported for which the models seem appropriate. The results appear relevant to a theory of size of length perception as well as to the general perceptual issue of absolute and relative judgments.—*Journal abstract*.

2126. Lester, Gene. (State University Coll. New York, Buffalo) **Subjects' assumptions and scores on the Rod-and-Frame Test.** *Perceptual & Motor Skills*, 1971(Feb), Vol. 32(1), 205-206.—50 undergraduates were tested on the Rod and Frame Test (RFT) and given a

questionnaire about the test. Uncertainty about the purpose and procedure of the RFT was associated with high error scores.—*Journal abstract*.

2127. Link, S. W. & Tindall, A. D. (McMaster U., Hamilton, Ontario, Canada) **Speed and accuracy in comparative judgments of line length.** *Perception & Psychophysics*, 1971(Mar), Vol. 9(3-A), 284-288. Presents an extension of V. A. Henmon's finding that RT decreases as the difficulty of discriminating a difference between 2 line segments decreases. Ss were 4 right-handed undergraduates. Results indicate that when an F-RT deadline is imposed on the experimental task, RT remains constant with respect to changes in discrimination difficulty, but that correct response probability increases with increasing difference between 2 line segments. Data are examined in terms of current theories for the speed-accuracy trade-off. (18 ref.)—*Journal abstract*.

2128. Lloyd, Van V. (Wilson Coll.) **Factors affecting the operation of Kundt's rule.** *Perceptual & Motor Skills*, 1971(Feb), Vol. 32(1), 175-189.—3 Ss were used to investigate the importance of various factors affecting the operation of that portion of Kundt's rule which says that, under conditions of monocular observation, an individual, in bisecting a horizontal line, will tend to locate the "bisector" somewhat to the nasal side of the true center. The variables studied included eye used, horizontal dimension of stimulus, and figure height or form (straight line, rectangle, or square). An analysis of variance showed that the different orders of judgments, Ss, eye used, and various interactions were significant sources of variation. The horizontal dimension of the stimulus and figure height or form yielded nonsignificant F ratios, although in the prior case, it is concluded that there was a real effect of the variable which is, however, hidden by the particular statistical analysis employed. Some of the data of individual Ss provide evidence for the existence of either an improvement or a deterioration in performance, as the judgmental process continued. Various possible explanations of the findings are discussed and evaluated. (21 ref.)—*Journal abstract*.

2129. Long, Gerald M. & Mo, Suchoon S. (U. Detroit) **Interaction of arousal and task difficulty upon perceptual restriction.** *Perceptual & Motor Skills*, 1971(Feb), Vol. 32(1), 259-264.—70 unpaid volunteers were required to perform both central and peripheral perceptual tasks presented simultaneously by means of 200-msec tachistoscopic flashes. The central task, requiring the discrimination between 2 lines on the basis of length, was progressively increased in difficulty from Test I to Test III. Peripheral task performance required the estimation of the number of black dots surrounding the central task. This number varied randomly between 1-8.1/2; the Ss in each test performed these tasks under stress (hand in ice water); the other Ss under no stress. A significant interaction ($p < .01$) was found; the stress group was inferior to the no-stress group on the peripheral task when the central task was relatively easy (Test I) but was superior to the no-stress group when the central task was extremely difficult (Test III). The results were interpreted in terms of the dependence of the "range of cue utilization" upon the degree of difficulty of the perceptual material as well as arousal level. (24 ref.)—*Journal abstract*.

2130. Lowenhaupt, S. Belinda & Rinalducci, Edward J. (U. Virginia) **Temporal factors in photopic dark**

findings uninterpretable. An example of such a study is given and evaluated, and a replication of that study ($N=3$ graduate and 1 undergraduate student), using a spatial forced-choice methodology, is reported in detail. The results of this replication are shown to contradict the critical findings of the earlier study; furthermore, it is suggested that any ambiguities in the results of this replication can be interpreted in terms of methodological and procedural factors, rather than in terms of higher-order neurological constructs. A further test of this methodological interpretation is proposed. (24 ref.)—*Journal abstract.*

Size & Distance & Depth Perception

2141. Coltheart, Max. (U. Waterloo, Ontario, Canada) **The effect of verbal size information upon visual judgments of absolute distance.** *Perception & Psychophysics*, 1971(Feb), Vol. 9(2-B), 222-223.—When an O views a blank triangle of light under completely reduced conditions, he is able to make use of verbally conveyed information about the size of this stimulus when he is attempting to judge the absolute distance of the stimulus. Although between-Os variance is rather large in this situation, group mean distance estimates are highly veridical. This is further evidence for the view that, when the O is given a retinal subtense, any kind of information about size enables him to make a judgment of absolute distance, just as information about distance enables him to make a judgment of absolute size. Ss in this study were 46 undergraduates.—*Journal abstract.*

2142. Hagino, Genichi. (Hiroshima U., Japan) **Effect of size cue on perceived distance.** *Proceedings of the Annual Convention of the American Psychological Association*, 1971, Vol. 6(Pt. 1), 73-74.—Conducted 2 experiments to investigate the effects of the relative size difference between 2 binocularly viewed white discs and that of the lateral separation between them on the perceived distance. The Os were 4 adults, and the method of constant stimuli was used. As the lateral separation increases, standard deviation (SD) and the amount of the displacement of the point of subjective equality, i.e., the size cue effect, increases. The amount of SD depends only on the lateral separation and not on the difference of the size. High correlation between the amount of displacement and SD was found.—*Author abstract.*

2143. Lee, David N. (U. Edinburgh, Scotland) **Binocular stereopsis without spatial disparity.** *Perception & Psychophysics*, 1971(Feb), Vol. 9(2-B), 216-218.—Binocular stereopsis has traditionally been studied mainly under static viewing conditions. There has consequently been the tendency to view binocular stereopsis only in terms of the pickup of purely spatial (time-frozen) disparity. However, whenever there is movement of objects or the O, the structure of the light entering each eye undergoes continuous change, and so a different type of disparity—kinetic disparity—is made potentially available to the binocular system. That kinetic disparity can, in fact, be picked up is shown by the present experiment, in which there was no spatial disparity information available about the 3-dimensional motion path of an object; only kinetic disparity information was available. This suggests that a clear distinction should be made between binocular-static and binocular-kinetic space perception.—*Journal abstract.*

Form & Pattern Discrimination

2150. Aiken, Leona S. & Brown, Donald. (Temple U.) **Feature utilization of continuously varying attributes in a visual pattern classification.** *Perception & Psychophysics*, 1971(Feb), Vol. 9(2-A), 145-149.—Examined feature utilization of continuously varying attributes in the context of classification of random polygons, the collection of which contained no a priori classes based upon physical features. 10 Os sorted 60 8-sided patterns into 2-9 groups. 1 wk. later, each O repeated 3 sorts and then placed 30 new patterns into the groups of his previous 5-group sort. Comparison of groups across sessions primarily showed repetition of initial classification. Stepwise discriminant analyses were performed on Os' classes, predictors being physical measures of various pattern attributes. Significant predictors of all classifications were found, the 2 most prevalent predictor types being measures of compactness and jaggedness. LDFs based on original pattern classes showed generality to new patterns. (29 ref.)—*Journal abstract.*

2151. Aiken, Leona S. & Brown, Donald R. (Temple U.) **A feature utilization analysis of the perception of pattern class structure.** *Perception & Psychophysics*, 1971(Mar), Vol. 9(3-A), 279-283.—Patterns were computer-generated about 2 prototypes to form schematic clusters of 3 diameters about the cluster centroids. In a schematic concept-formation task, recovery of a priori

introduced between monocular and binocular viewing, but when the arrangements were otherwise approximately the same as those of Hochberg and Beck, their results could not be observed. Exp. III ($N = 12$ undergraduates) demonstrated that the monocularly observed trapezoids did appear slanted.—*Journal abstract.*

AUDITION

2162. Emmerich, David S. (State U. New York, Stony Brook) Cueing signals in auditory detection and frequency discrimination experiments. *Perception & Psychophysics*, 1971(Feb), Vol. 9(2-A), 129-134.—Investigated the effects of presenting a cueing signal during the warning interval initiating a trial in 2-interval forced-choice detection and frequency-discrimination experiments. It was expected that the cueing signal would reduce the uncertainty of Ss about the stimuli being presented in these experiments. In general, it was found that performance tended to improve as the experiments progressed, both in conditions in which cues were presented and in control conditions in which no cues were presented. The improvement observed in control conditions is not usually found in similar experiments in which cues are not employed. Though performance generally improved, it was found that for some stimulus conditions the cues tended to depress average performance below the level attained without such cues.—*Journal abstract.*

2163. Pollack, Irwin. (U. Michigan) Discrimination of restrictions upon auditory sequentially encoded information: Block parity. *Perception & Psychophysics*, 1971(Feb), Vol. 9(2-B), 253-256. Finite-state sequences were generated by a digital computer, converted to interval-coded pulse sequences, and transduced to sound by means of earphones. Within each block of B successive intervals, (B-1) intervals were randomly selected and the Bth interval was selected to achieve a fixed parity sum over the block. Discriminability among the sequences—as measured by interstate interval thresholds—reflects both the specific form and the extent of the sequential restrictions introduced by parity. Parity restrictions upon interval-coded sequences may be discriminable through modification of distribution of runs.—*Journal abstract.*

2168. Green, David M. & Luce, R. Duncan. (U. California, San Diego) Detection of auditory signals presented at random times: III. *Perception & Psychophysics*, 1971(Mar), Vol. 9(3-A), 257-268. Measured RTs of 3 Ss to a pure tone in noise. Throughout, the time from the warning signal to the reaction signal was exponentially distributed, and the signal was response terminated. Response criterion, signal intensity, and mean foreperiod wait were varied. A model that assumes a Poisson sensory transduction, a pulse-activated decision process, and an additive bounded residual process, was tested. It is concluded that the assumed decision process was in error. Among the empirical results, the dependence of mean RT on signal waits was shown to depend largely on the average wait, not the actual 1, and that this relationship between mean RT and average stimulus wait increased for strong signals and decreased for weak ones.—*Journal abstract.*

2169. Guzy, Lawrence T. & Axelrod, Seymour. (State U. New York, Buffalo) Synchronization of unimanual and bimanual responses with monotic and dichotic clicks. *Perception & Psychophysics*, 1971(Feb), Vol. 9(2-A), 161-164.—In experiments requiring subjective judgments, the apparent rate of rapidly presented dichotically alternating clicks has consistently been shown to be slower than that of clicks presented monotically. The 1st of the present studies ($N = 20$ male undergraduates) asked (a) if slowing of dichotic clicks would be observed when the listener's task was to "follow" the clicks with overt motor responses (unimanual keypresses) rather than to make psychophysical judgments, and (b) if following of dichotic clicks could be improved by providing 2 response channels (alternating bimanual presses). Both answers were affirmative. The 2nd study ($N = 8$ male undergraduates) asked if the improvement obtained in the bimanual condition reflected increased perceptual capacity. Results indicate that it did not, but was attributable to an increase in response ceiling.—*Journal abstract.*

Speech Discrimination

2172. Strange, Winifred & Halwes, Terry. (U. Minnesota) Confidence ratings in speech perception research: Evaluation of an efficient technique for discrimination testing. *Perception & Psychophysics*, 1971(Feb), Vol. 9(2-A), 182-186.—Discriminability of voice onset time was determined for 4 naive Ss in order to evaluate the relative efficiency of a testing procedure which utilized confidence ratings along with the conventional oddity task. Ss rated their judgments on oddity trials as "very very sure," "somewhat sure," or "just guessing." Each S's discrimination scores were given

weights according to his ratings, yielding functions that were compared with those computed using unweighted percent correct scores. The confidence-rating technique produced readily interpretable results with about $1/2$ as many judgments as are needed when the conventional procedure is used. Possible problems with the interpretation of the functions and the generalizability of the technique are discussed.—*Journal abstract.*

CHEMICAL SENSES

2175. Henion, Karl E. (U. Texas) **Psychophysical scales of the olfactory pleasantness of homologous alcohols.** *Perception & Psychophysics*, 1971(Feb), Vol. 9(2-B), 234-236.—A category, a ratio estimation, and 3 magnitude scales were constructed from the observations of 10 Os who judged the pleasantness of a homologous series of n-aliphatic alcohols. Magnitude scaling indicated that pleasantness generally varied inversely with chain length, which is consistent with the findings of earlier investigators who used different methods; ratio estimation also indicated an inverse relationship. Stable magnitude scales resembled power functions with exponents of $-.262$ to $-.587$; the adjusted ratio estimation's was $-.138$. Pleasantness seemed to be unexpectedly prothetic, some evidence of which had also been reported in an earlier study involving a more diverse set of odorants. Yet in the present study the hedonic range was small and in the earlier, large. More than the size of range appears to account for the puzzling prothetic evidence.—*Journal abstract.*

SOMESTHESIA

2176. Clark, W. Crawford & Mehl, Louis. (New York State Psychiatric Inst., New York) **Values of d' obtained by various SDT procedures are not equal when thermal stimuli are judged.** *Proceedings of the Annual Convention of the American Psychological Association*, 1971, Vol. 6(Pt. 1), 9 10.—Signal detection theory was used to determine thermal sensitivity (d') for stimuli separated by 25 mcal/sec/cm², over the range from detection (0-25) to painful (400-425). 4 Ss served for 34 sessions each. The forced-choice and binary-decision d' s did not differ from each other, but were significantly higher than d' s obtained from the magnitude rating procedure ($p < .01$) or the certainty rating procedure ($p < .05$). The 2 rating procedures did not differ. These results suggest that Ss find it difficult to maintain multiple criteria in a consistent fashion when judging thermal stimuli.—*Author abstract.*

2177. McFarland, Richard A. (California State Coll., Fullerton) **Enhancement of thermal estimates by concomitant pressure stimulation.** *Journal of Ex-*

perimental Psychology, 1971(Apr), Vol. 88(1), 20-25.—Presented simultaneously stimuli that varied in both temperature and pressure to the same spot on the forearm. 32 male and 32 female undergraduates estimated the magnitude of the temperature decreases. Magnitude estimates of the temperature decreases were reliably larger, the larger the concomitant pressure. Other experiments indicated that the effect was not completely dependent upon the pressure and temperature changes overlapping spatially and temporally. It is concluded that the effect of pressure upon temperature sensations may be mediated by several different neural pathways. In all cases, compared with the effect of temperature upon the judgments, the effect of the pressure was small and limited mainly to differences between the 2 lowest levels of pressure. ENVIRONMENTAL EFFECTS

SLEEP & FATIGUE & DREAMS

2179. Arkin, Arthur M., Toth, Max F., Baker, Julia, & Hastey, John M. (City Coll., City U. New York) **The degree of concordance between the content of sleep talking and mentation recalled in wakefulness.** *Journal of Nervous & Mental Disease*, 1970(Dec), Vol. 151(6), 375-393. Compared the content of 166 sleep speeches uttered by 28 paid chronic sleep talkers in the laboratory to the content of wakeful mentation reports elicited shortly after utterances. Concordance between the 2 in varying degrees was discernible in 79.2% of REM period, 45.8% of Stage II, and 21.1% of Stages III-IV speech report pairs. Concordance tendencies were also studied on several varying experimental conditions. (16 ref.)—*Journal abstract.*

2180. Arkin, Arthur M., Toth, Max F., Baker, Julia, & Hastey, John M. (City Coll., City U. New York) **The frequency of sleep talking in the laboratory among chronic sleep talkers and good dream recallers.** *Journal of Nervous & Mental Disease*, 1970(Dec), Vol. 151(6), 369-374.—Reports data from a series of experiments aimed at establishing base-line measures of the degree to which "sleep utterance" is associated with REM period and the 4 accepted NREM stages of sleep. Data presented include findings for chronic "sleep talkers," good dream recallers, during interrupted and uninterrupted sleep. Marked individual differences were noted and discussed.—*R. A. Denis.*

2181. Backeland, Frederick. (State U. New York, Downstate Medical Center, Brooklyn) **Effects of pre-sleep procedures and cognitive style on dream content.** *Perceptual & Motor Skills*, 1971(Feb), Vol. 32(1), 63-69. Examined the REM period dream reports of 2 groups of Ss with different kinds of presleep

experiences with respect to laboratory references, overt references to E, pleasantness and unpleasantness of content, self-representation of the dreamer in his dreams, and dream recall. Group 1 included 17 Ss who were not exposed to any special presleep procedure. Group 2 was composed of 27 Ss who underwent a 1/2-hr presleep association period under conditions of partial sensory isolation which were anxiety provoking and focused Ss' attention on laboratory procedures. Group 2 had more dreams related to the laboratory situation (lab dreams) and more unpleasant dreams. They were more often participants in their dreams and they recalled them less well than Group 1. Cognitive style was also a determinant of lab dreams and the participant-O dimension of dream content. (17 ref.)—*Journal abstract.*

2182. Ekstrand, Bruce R., Sullivan, Michael J., Parker, David F., & West, James N. (U. Colorado) **Spontaneous recovery and sleep.** *Journal of Experimental Psychology*, 1971(Apr), Vol. 88(1), 142-144.—Investigated the hypothesis, suggested by B. R. Ekstrand (see PA, Vol. 41:14689), that spontaneous recovery observed following sleep is related to REM or Stage-4 sleep. 5 groups of 20 undergraduates learned 2 paired-associate lists (A-B, A-C) and were tested for A-B recall either immediately, 20 min., or 7 hr. after A-C learning. The 7-hr groups slept in the laboratory during the retention interval while EEG, electrooculogram, and EMG recordings were made. 1 group was deprived of REM sleep, 1 was deprived of Stage-4 sleep, and the 3rd was a pseudodeprivation control. Results indicate no difference among any of the 5 conditions. The 2 control conditions produced results suggesting spontaneous recovery over 20 min. Findings suggest that the recovery found by Ekstrand probably had occurred before his Ss actually fell asleep.—*Journal abstract.*

le comportement instinctif. [The mechanism of se hypnosis and instinctive behavior.]—A number provocative notions are advanced regarding artificial dreams as intermediary between hypnosis and the subconscious, comparing hypnosis to an interiorized seance, and the organization of the unconscious as organized somnambulism.—K. J. Hartman.

MOTIVATION & EMOTION

2188. Barkóczi, Ilona. (Eötvös Lóránd U., Budapest Hungary) **A kutasó manipuláció egyes jellemzőinek változása ingerdús és izolált szituációban.** [Change in certain characteristics of exploratory manipulation as a function of stimulus richness or stimulus deprivation.] *Pszichológiai Tanulmányok*, 1967, No. 10, 357-361.

2189. Baron, Robert A. (U. South Carolina) **Aggression as a function of magnitude of victim's pain cues, level of prior anger arousal, and aggressor-victim similarity.** *Journal of Personality & Social Psychology*, 1971(Apr), Vol. 18(1), 48-54.—Hypothesized that (a) under conditions of high aggressor-victim similarity, feedback from the victim would be highly effective in reducing the level of attacks directed against this individual, both in the presence and absence of prior instigation to aggression; and (b) under conditions of low aggressor-victim similarity, pain cues from the apparently suffering victim would be successful in inhibiting subsequent aggression only in the absence of prior anger arousal. Results with 80 male undergraduates indicate that contrary to b, signs of pain and suffering on the part of the victim produced significant decrements in the strength of the attacks against this person under all experimental conditions.—*Journal abstract.*

2190. Deci, Edward L. (U. Rochester) **Effects of externally mediated rewards on intrinsic motivation.** *Journal of Personality & Social Psychology*, 1971(Apr), Vol. 18(1), 105-115.—Conducted 2 laboratory and 1 field experiment with 24, 24, and 8 undergraduates to investigate the effects of external rewards on intrinsic motivation to perform an activity. In each experiment, Ss performed an activity during 3 different periods, and observations relevant to their motivation were made. External rewards were given to the experimental Ss during the 2nd period only, while the control Ss received no rewards. Results indicate that (a) when money was used as an external reward, intrinsic motivation tended to decrease; whereas (b) when verbal reinforcement and positive feedback were used, intrinsic motivation tended to increase. Discrepant findings in the literature are reconciled using a new theoretical framework which employs a cognitive approach and concentrates on the nature of the external reward. (26 ref.)—*Journal abstract.*

2192. Fredericks, Richard S., & Groves, Marion H. (Illinois Inst. of Technology) **Pupil change and stimulus pleasantness.** *Proceedings of the Annual Convention of the American Psychological Association*, 1971, Vol. 6(Pt. 1), 371-372.—Tested the hypothesis that pleasant pictorial stimuli elicit pupil dilation responses and unpleasant pictorial stimuli elicit constriction responses. Pupil responses for 45 males to 25 affective stimuli were compared to stimulus ratings of both experimental Ss and independent judges. Pupil change classified by both

stimulus cards in 2 experiments with 24 undergraduate and graduate students in each. Stimuli were constructed from 2 dichotomous dimensions, used either alone or perfectly correlated. The lack of evidence for a selective serial processing (SSP) strategy (in which S sorts by his most preferred dimension whenever the dimensions are correlated) in a similar study by W. R. Garner and G. L. Felfoldy was thought to be due to Ss' failure to notice that the dimensions were correlated, and thus that SSP would be effective. Ss in the present experiment therefore received either implicit instructions concerning the existence of the correlated deck (by seeing only decks in which there were just 2 different stimuli), or explicit instructions that on some trials the 2 dimensions would be correlated and S could sort by any means he preferred. When dimensions of size of circle and angle of diameter were of unequal discriminability, implicit instructions produced partial use of the SSP strategy, while explicit instructions produced nearly total use of SSP by all Ss. When the Munsell dimensions of value and chroma were varied in 2 separate color chips and were equally discriminable on the average, evidence for a small amount of SSP was found in both the implicit and explicit conditions. With neither pair of dimensions did implicit or explicit instructions regarding the correlated task produce integration of information.—*Journal abstract*.

2207. Franken, Robert E., Poole, Glen G., & Grauer, Leslie. (U. Calgary, Alberta, Canada) **Pacing stimulus predifferentiation in detection of change.** *Perceptual & Motor Skills*, 1971(Feb), Vol. 32(1), 279-282.—Attempted to evaluate (a) whether gradually adding new information to a display (pacing) is an efficient way to teach Ss to identify a complex display, and (b) whether pacing would produce greater stimulus predifferentiation as measured by more accurate detections of a change when the change was made in a display containing the same material. The results for 16 male college students indicate there is positive transfer between steps in the pacing procedure and that pacing produces more accurate detection of change. It may be that an independent skill is acquired as the result of pacing which is responsible for the improved ability to detect change.—*Journal abstract*.

2210. Keleman, Kenneth S. (San Diego State Coll.) **Note on looking time: Experimenter and instruction effects.** *Perception & Psychophysics*, 1971(Feb), Vol. 9(2-B), 224.—Discusses the results of B. T. Leckart, L. Gehren, and G. Thornton (see PA, Vol. 44:19844) whose report that E's presence inhibited Ss' looking time was interpreted as Ss' fear that long looking times might be self-intimidating to the E. The demonstrations by D. D. Thiessen (see PA, Vol. 39:1039) and J. J. Christian and D. E. David (see PA, Vol. 39:7106) of the presence of other organisms increasing arousal at the infrahuman level are extended to the human level, and it is concluded that "E's presence should be reflected in a looking time decrease." Studies by R. B. Zajonc (see PA, Vol. 39:16348) and R. B. Zajonc and S. M. Sales (see PA, Vol.

40:8799) indicate that "the presence of others increases dominant or high-probability responses, and inhibits subordinate or low-probability ones." It is concluded that looking at slides is a low-probability response, and therefore "E's presence should reduce the duration of looking behavior."—P. McMillan.

2211. Peterson, Mari A. & Peterson, Rein. (Cornell U.) **Information processing and strategy.** *Psychonomic Science*, 1970(Dec), Vol. 21(6), 365.—Conducted a replication of U. Neisser's visual scanning experiment using 3 male graduate students as Ss. An attempt to control for difficulty of target letters in relation to one another, as well as to the background letters, was only partially successful. Several strategies of scanning different conditions were reported during debriefing of Ss.—*Journal abstract*.

(New School for Social Research) **U-shaped backward masking functions with nonmetaccontrast paradigms.** *Psychonomic Science*, 1970(Dec), Vol. 26(1), 361-363.—As the interval from the onset of a target letter to the onset of a masking stimulus is increased, target recognition 1st becomes worse and then improves under some conditions. Previously, these U-shaped functions have been documented only when metaccontrast masking paradigms have been used. In the present studies with 4 highly-trained Os, U-shaped functions were found with nonmetaccontrast paradigm. Using pattern mask, U-shaped functions were found when the target energy was greater than the mask energy. Moreover, a set of parameters was found that produced U-shaped functions when no contours were present within the masking field.—*Journal abstract*.

2213. Robinson, David O. (U. Oxford, England) **The limits of selective attention in DAF shadowing.** *Psychonomic Science*, 1970(Dec), Vol. 21(6), 325-327.—12 naive male undergraduates with normal hearing read a passage of English prose at their own speed, and this was tape-recorded and used as the irrelevant message in a dichotic-listening shadowing task. The primary message to which the Ss attended was 1500 words long, and after the 1000th word, the irrelevant message was switched noiselessly to delayed auditory feedback (DAF). Finally, Ss read a 1000-word passage while experiencing DAF. Results confirm previous findings that the limits of selective attention are exceeded when DAF is the nonattended message and suggest the importance of immediate auditory feedback in a speech-production mechanism that involves specific delays within the system which are associated with a normal speaking rate for each individual.—*Journal abstract*.

2215. Tolin, Philip. (Central Washington State Coll.) **Instruction effects on watch keeping in a "simple" vigilance task.** *Perception & Psychophysics*, 1971(Feb), Vol. 9(2-B), 227-228.—2 experiments (Ns=22 undergraduates in Exp. I, and 60 in Exp. II) were conducted to determine the effect of variation in pretask instructions on performance on a simple vigilance task. In both experiments 1 group was told that the task would be challenging (Group C) and the other group, that the task would be monotonous (Group M). In Exp. I time-related decrements were found in the percentage of correct

signal detections and in the number of incorrect responses. The results of Exp. II indicate time-related decrements, but no group differences, in percentage of correct detections. Group M also made progressively fewer false alarms, while false-alarm rates for Group C did not change over time. Differences in mechanisms underlying performance decrements are discussed.—*Journal abstract.*

2216. Uleman, James S. & Reeves, Jeanine. (Michigan State U.) **A reversal of the Stroop interference effect, through scanning.** *Perception & Psychophysics*, 1971(Mar), Vol. 9(3-A), 293-295.—Interference on the Stroop test has been explained on the basis of a stronger habit (word reading) interfering with a weaker 1 (color naming) on an incongruous color-word (CW) card. Since scanning for words is slower (weaker) than scanning for colors, it was predicted that making the Stroop a scanning task would produce more interference with scanning for words rather than colors on the CW card. This prediction was confirmed in an experiment with 60 undergraduates. Analyses of individual differences offered some support for differential habit-strength theories of Stroop interference. However, differences between the standard and scanning Stroop tests suggest that some kind of information-processing analysis would be more fruitful.—*Journal abstract.*

2217. Warner, Harold D. & Heimstra, Norman W. (U. Missouri, Rolla) **Effects of intermittent noise on visual search tasks of varying complexity.** *Perceptual & Motor Skills*, 1971(Feb), Vol. 32(1), 219-226. 4 noise ratios were utilized: 0, 30, 70, and 100% noise on-time in successive 5-sec intervals. The task required that Ss search a display for a single letter located among a larger background of letters which were all the same but different from the single letter. Task complexity was varied by changing the number of background letters. 2 difficulty levels were utilized: 8- and 32-letter displays. 22 male college students were tested under all conditions specified by the Task Complexity \times Noise Ratio matrix. Detection speeds for the 32-letter task condition were faster for any ratio of noise than in the control condition but for the 8-letter condition only the 30% noise ratio was faster than the control. The speeds for the 70 and 100% ratios were slower for the 8-letter condition. The order of the 30, 70, and 100% ratios, however, without the control comparison indicated that the relative differences between noise effects were the same for both levels of task complexity. The order of conditions beginning with fastest was: 30, 100, and 70%.—*Journal abstract.*

2218. Williges, Robert C. & Streeter, Harrison. (U. Illinois) **Display characteristics in inspection tasks.** *Journal of Applied Psychology*, 1971(Apr), Vol. 56(2), 123-125.—Tested 8 female undergraduates on detection of pin-hole defects in a visual scanning task. Display type (static vs. dynamic) and display arrangement (random vs. ordered) were combined factorially in a within-S design. Static (inspector-paced) displays yielded more defect detections and fewer false alarm errors, whereas, display arrangement did not effect detections or false alarm errors. It is concluded that inspector-paced displays seem to be more beneficial than externally paced displays when rapid scanning rates are required.—*Journal abstract.*

MOTOR PERFORMANCE

2219. Boswell, John J. (U. Missouri, St. Louis)

Effects of three levels of interpolated activity on the acquisition of a simple motor skill. *Perceptual & Motor Skills*, 1971(Feb), Vol. 32(1), 35-42.—96 male students performed for 20 min. on a pursuit rotor with either the preferred hand (P) or nonpreferred (Np) hand. Practice was either massed (M), spaced (Sp), or switched (Sw) which required S to switch hands during alternate 30-sec practice periods. The results show an overall difference between hands ($P > Np$) and among practice conditions ($Sp > Sw > M$), but the observed intermediate position of Sw was uninterpretable since either dissipation of inhibition or transfer of training could have produced this effect (17 ref).—*Journal abstract.*

REACTION TIME

2224. Bernstein, Ira H. & Clark, Mark H. (U. Texas, Arlington) **Intersensory effects in the psychological refractory period.** *Perceptual & Psychophysics*, 1971(Feb), Vol. 9(2-A), 135-139.—2 experiments examined RT to each of 2 stimulus events separated by short interstimulus intervals (ISIs). The experimental conditions were: RT to the 2nd visual signal (R2) in auditory-visual (AV) vs. visual-visual (VV) sequences. With response critical pairings in Exp. I ($N=2$ undergraduate pairs), a significant effect appeared, demonstrating a sensory channel process was tested. RT was generally faster for AV as opposed to VV sequences especially when Ss were uncertain as to the sequence that would occur. At the 1st ISI the R1 difference between responses in AV and VV sequences was the R1 difference between RT to AV sequences and the R1 difference between RT to VV sequences in Exp. II ($N=3$ also observed with 60 vs. 30 pairings in Exp. II) ($N=3$ undergraduates) when the initial event was a 2nd signal. However, the R1 difference disappeared upon

error correction, making the RT, sequence difference of questionable relevance to the hypothetical single-channel process. RT₁ was more rapid following a null no-go signal when the no-go signal was contrasted with a visual as opposed to auditory go signal. The latter effect was independent of error and is consistent with channel-switching theory.—*Journal abstract.*

2225. Downing, Bruce D. (Kent State U.) **Response probabilities and "same-different" reaction times.** *Perception & Psychophysics*, 1971(Feb), Vol. 9(2-B), 213-215.—A "same-different" RT task with multi-dimensional stimuli was used with a 50:50 and a 75:25 proportion of "different" to "same" response (Ss were 8 undergraduates). The "different" RTs to each dimension were similar for the 2 proportions. However, the "same" RT in the 50:50 condition was faster than the "same" for the 75:25 condition and faster than the slowest "different" RT. Interpretations of the results in terms of response bias and processing criteria are offered.—*Journal abstract.*

2226. Henderson, Leslie. (U. Guelph, Ontario, Canada) **Simple reaction time, statistical decision theory, and the speed-slowness tradeoff.** *Psychonomic Science*, 1970(Dec), Vol. 21(6), 323-324.—Measured simple auditory RT at 3 stimulus intensities under both speed and accuracy instructions in an experiment with 6 male undergraduates with normal hearing. The slope of RT over intensity was greater for accuracy criteria, as predicted by statistical decision theory. Speed criterion performance was not attributable to a shift in pre-programmed anticipatory responses.—*Journal abstract.*

2227. Ollman, Robert T. (U. Pennsylvania) **A study of the fast guess model for choice reaction times.** *Dissertation Abstracts International*, 1970(Dec), Vol. 31(6-B), 3733-3734.

Germany) **Tagesperiodische Veränderungen der Reaktionszeit bei Wahrreaktionen.** [Changes of reaction time in selection tasks due to varying test schedules during the day.] *Zeitschrift für experimentelle und angewandte Psychologie*, 1970, Vol. 17(4), 537-552. Investigated the effect of disturbing the natural rhythm of sleep and wakefulness on RTs to visual and acoustic stimuli. Variations are greatest when sleeping Ss are awakened for the tests. Staying awake during the night results in a decrease of variability compared to tests during the day. Motivation and repetition of tests are factors which have to be controlled in studies of this kind. (English & French summaries) (35 ref.)—*W. J. Koppitz.*

2229. Sanford, A. J. (U. Dundee, Scotland) **Rating the speed of a simple reaction.** *Psychonomic Science*, 1970(Dec), Vol. 21(6), 333-334.—In an experiment with 6 enlisted men, it was shown that in an auditory simple reaction task Ss can rate their RTs with regard to speed. Furthermore, reactions to quiet signals are generally rated as being slower than reactions to loud signals. This observation does not support the view that RT-intensity effects are totally mediated through peripheral or predetection lags.—*Journal abstract.*

2230. Swenson, Richard G. & Edwards, Ward. (Bell Telephone Lab., Inc., Holmdel, N.J.) **Response strategies in a two-choice reaction task with a continuous cost for time.** *Journal of Experimental Psychology*, 1971(Apr), Vol. 88(1), 67-81.—Each trial of a 2-choice task rewarded S for a correct response, but charged a

cost proportional to his response time. 7 of the 8 Ss in 3 experiments violated predictions of the random-walk model and confirmed those of the fast-guess model by using only 2 response strategies in all conditions. These Ss either responded accurately or made a detection response when the stimulus appeared, accepting chance-level error rates to respond in 20 or 45-70 msec. faster (for 2 different types of stimuli). Stimulus frequency and payoffs primarily determined which strategy S would adopt. Data were ambiguous for only 1 S, equally well fit by the random-walk model and by assuming that he intermittently guessed on some proportion of trials. (17 ref.)—*Journal abstract.*

LEARNING

2232. Belgard, Maria R. & Min, Leo Y. (Stanford U.) **Optimizing the learning process through a TL network model: An operations research approach.** *Proceedings of the Annual Convention of the American Psychological Association*, 1971, Vol. 6(Pt. 1), 63-64.—Introduces a teaching-learning (TL) network model to optimize the learning process. The learning task is sectioned into TL elements which are sequenced according to an optimization rule. A student's flow through the learning process is controlled by the TL element increment loop and the optimal path updating loop. A mathematical programming model of "assignment problem" type is developed and solved by the "direct solution method." Since the optimal path has 2 cost coefficients, a theorem is constructed and proven which states that no single optimal solution can be found unless the 2 optimal solutions are combined according to the averaging method or the constraint addition method, both of which are developed. The TL network model makes scientific individualized optimization of the learning process a reality.—*Author abstract.*

2233. Du Charme, Wesley M. & Schum, David A. (Rice U.) **Human multistage probabilistic inference.** *Proceedings of the Annual Convention of the American Psychological Association*, 1971, Vol. 6(Pt. 1), 65-66.—Compared human inferences based on unreliably perceived events with the inferences of an optimal, multistage model. The model is a form of Bayes' theorem which uses likelihood ratios adjusted for data unreliability. 15 paid Ss observed sequences of binomial data under conditions of perfect and imperfect reliability. They revised odds about which binomial population had generated the sequences and they also made estimates of the diagnostic impact associated with each datum. Under conditions of imperfect reliability both odds revisions and estimates of diagnostic impact were excessive when compared to the optimal model.—*Author abstract.*

2239. Levine, Marvin. (State U. New York, Stony Brook) **Hypothesis theory and nonlearning despite ideal S-R-reinforcement contingencies.** *Psychological Review*, 1971(Mar), Vol. 78(2), 130-140.—Hypothesis theory generates a few theorems about adult humans failing to reach criterion in discrimination-learning tasks: (a) their performance should match behavior on tasks which are intrinsically insoluble but otherwise comparable to the normal tasks; and (b) for certain stimulus sequences, performance on both the unsolved and insoluble problems should be below the chance level. Data confirm both of these predictions. The theory also stipulates the conditions for producing nonlearning by motivated Ss. According to the theory, as long as S is sampling from a set of incorrect hypotheses (i.e., a set lacking the solution) he will show no learning. No response strengthening will occur in this circumstance even if the solution consists in the simplest contingencies (e.g., E says "right" when S says "A," and "wrong" when S says "B"). A series of experiments validated the prediction. The relation of these results to random-prediction, the awareness controversy, and the feedback effects, the awareness controversy, and the Einstellung phenomenon is discussed. (34 ref.)—*Journal abstract*.

2241. Reynolds, Donald & Atiyah, Steven K. (U. Oklahoma) **Extinction in probability learning as a function of schedules of reinforcement during**

acquisition. *Proceedings of the Annual Convention of the American Psychological Association*, 1971, Vol. 6(Pt. 1), 69-70.—4 studies related resistance to extinction and schedules of reinforcement during acquisition of a probability learning task. Ss were undergraduates. Study I showed no differential extinction resistance resulting from reinforcement scheduling. Study II extinguished differentially reinforced Ss with presence absence of stimuli present during acquisition. Study III established mean acquisition trials for each reinforcement group. Study IV replicated Study II with acquisition trials per Study III. Stimulus onset effects dominated extinction, while schedules of verbal reinforcement had negligible effects. It was hypothesized: (a) Ss relied on light onset rather than verbal reinforcement during acquisition; (b) generalization decrement accounts for certain extinction effects.—*Author abstract*.

2242. Sticht, Thomas G. (Human Resources Research Organization, Monterey, Calif) **Failure to increase learning using the time saved by the time compression of speech.** *Journal of Educational Psychology*, 1971(Feb), Vol. 62(1), 55-59. Used time-compressed tape recordings to determine if presenting new information in the time saved by the compression process would improve overall performance on a criterion listening comprehension test. 75 high- and 75 low-aptitude 18-25 yr. old men served as Ss. Results indicate that learning of new material presented in the time saved by the compression process did occur, but overall learning did not surpass that obtained by listening to the uncompressed, unelaborated material.—*Journal abstract*.

2243. Tempone, Vincent J., Capehart, Jack, & Decker, Larry. (U. Arizona) **Attentional processes in overtraining.** *Perceptual & Motor Skills*, 1971(Feb), Vol. 32(1), 127-132.—Examined the effects of overtraining using 2 dependent variables, choice response and eye fixations. Although an overtraining reversal effect was not found using choice-response, examinations of a number of eye fixations both before and after reversal suggest that the introduction of reversal training produces greater shifts in attention in the overtrained ($n = 6$ undergraduates) as opposed to the criterion trained group ($n = 6$). Results are interpreted as supporting a theory of discrimination learning which proposes that S is developing a plan in which inputs are tested or compared against some centrally organized process.—*Journal abstract*.

2244. Williams, Carl D., Hartley, Raymond E., Taylor, James L., & Harrington, Richard T. (U. Miami) **Path dependence in probability learning.** *Proceedings of the Annual Convention of the American Psychological Association*, 1971, Vol. 6(Pt. 1), 71-72.—Applied a previously untested stimulus sampling model and a cognitive model to data from 5 2-choice, uncertain-outcome experiments. Undergraduates served as Ss ($N = 300$ in Exp. I, 100 each in Exp. II, III, and IV, and 160 in Exp. V). Both models were found to predict sequential choice behavior with considerable accuracy. Each model includes a mechanism that enables different subsequences of events to be mastered at separate rates. The path dependent feature shared by these models enables stimulus sampling theory to predict the negative recency phenomenon as a function of the event sequence.—*Author abstract*.

Conditioning

2245. Allen, John A. (North Carolina State U.)

Relationships between orienting response level, conditioners, and voluntary responders. *Proceedings of the Annual Convention of the American Psychological Association*, 1971, Vol. 6(Pt. 1), 29-30.—Results of recent studies have indicated that voluntary responders and high orienters may be especially sensitive to words and the meanings they convey. To examine this possibility, an experiment was performed in which 80 male undergraduates experienced both semantic conditioning (generalization and differential eyelid conditioning (using verbal CSs) procedures within the same experimental session. No evidence was found to support similarities between orienting response level and conditioning type. However, unexpectedly, significant differences in heart rate were found between voluntary responders and conditioners.—*Author abstract.*

2246. Bowers, Kenneth S. (U. Waterloo, Ontario, Canada) **An attributional analysis of operant conditioning: Paradoxical effects of reinforcement on the endurance of behavior change.** *Proceedings of the Annual Convention of the American Psychological Association*, 1971, Vol. 6(Pt. 1), 287-288.—An attributional analysis of operant conditioning suggests that behavior change attributed to contingent reinforcement will quickly dissipate when reinforcement is discontinued. The present study permitted comparison of Ss with and without the opportunity to misattribute behavior change (achieved posthypnotically) to contingent reinforcement. Reinforced Ss returned to their base-rate performance much more quickly than unreinforced Ss. Rather than misattributing their changed behavior to reinforcement, the reinforced Ss seemed to react against it, as if reinforcement constituted a threat to their free choice. Cautions in the use of operant conditioning are suggested, based on considerations of attribution theory.—*Author abstract.*

2248. Dixon, Paul W. & Cummings, William C. (U. Hawaii, Hilo) **Effect of intertrial interval and verbal reinforcement on choice of front or back tongue position.** *Perceptual & Motor Skills*, 1971(Feb), Vol. 32(1), 59-62. 2- vs. 4-sec ITIs significantly increased choice of front-articulated vowels as compared with back-articulated vowels in 4 reinforced and 4 nonreinforced groups of 5 native English-speaking undergraduates each. Ss showed a significant preference for front-over back-articulated vowels. The hypothesis that shorter ITIs would increase conditioning was not supported since no reinforcement effects were found. Discrimination between the 2 response classes of front- and back-articulated vowels was demonstrated in the 4 2-sec ITI groups as compared with the 4 4-sec ITI groups. The preference for front- over back-articulated vowels and increased preference for the front- over back-articulated vowels due to shorter ITIs is discussed in terms of stimulus choice due to prior learning of English.—*Journal abstract.*

2249. Kennedy, Thomas D. (Arizona State U.) **Reinforcement frequency, task characteristics, and interval of awareness assessment as factors in verbal conditioning without awareness.** *Journal of Experimental Psychology*, 1971(Apr), Vol. 88(1), 103-112.—Investigated the temporal relationship between

performance gains and awareness. 100 undergraduates were reinforced for pronoun responses in a sentence-construction task or for human noun responses in a word-naming task. Awareness was assessed from notes written by Ss during the conditioning task and from a postconditioning questionnaire. Of unaware Ss, only those reinforced for pronoun responses showed a conditioning effect. Aware Ss demonstrated performance gains prior to reports of awareness, although the effect was more pronounced in the sentence-construction task. Results support a behavioral explanation of verbal conditioning that performance gains and awareness are both dependent variables which can be influenced directly by reinforcement or indirectly by other factors, e.g., nature of the task. It is concluded that unless awareness is assessed frequently during conditioning, performance gains occurring prior to awareness may not be detected, leading to erroneous conclusions about the role of awareness in verbal conditioning.—*Journal abstract.*

2253. Freund, Joel S. (Northwestern U.) **Variability of subject's judgments of frequency and their effect on verbal-discrimination learning.** *Dissertation Abstracts International*, 1971(Jan), Vol. 31(7-B), 4360-4361.

2254. Guthrie, John T. (Johns Hopkins U.) **Feedback and sentence learning.** *Journal of Verbal Learning & Verbal Behavior*, 1971(Feb), Vol. 10(1), 23-28.—Examined the theoretical functions of external feedback in stimulus-response (S-R) and closed-loop models of verbal learning. Contradictory predictions from the models were tested with a 3×3 factorial experiment including 3 types of feedback and 3 amounts of rehearsal. 90 male undergraduates were tested individually and required to learn 39 sentences verbatim. Results indicate that feedback (a) facilitated learning when it followed wrong responses; (b) had no effect on learning following correct responses; and (c) consisting of both the stimulus and the response was superior to no feedback, whereas feedback consisting of only the response did not differ from no feedback. The closed-loop model is supported.—*Journal abstract.*

2255. Hopkins, Ronald H. & Epling, William F. (Washington State U.) **Pronunciation and the length of the study interval in verbal discrimination.** *Journal of Experimental Psychology*, 1971(Apr), Vol. 88(1), 145-146.—Hypothesized that the difference between silent- and verbalization-study conditions might be caused by more time pressure, and an effectively shorter study interval, in the silent- than in the verbalization-study condition. This hypothesis was tested by varying the length of the study interval for 78 undergraduates.

Silent study produced better performance than did verbalization, and the difference was independent of the length of the study interval. It is concluded that the frequency theory is an adequate interpretation of the detrimental effect of pronunciation of both members of a verbal discrimination pair.—*Journal abstract.*

2256. Huang, I-ning & Hynum, Les J. (Wisconsin State U.) **Degrees of isolation and the Von Restorff effect in serial learning.** *Psychonomic Science*, 1970 (Dec), Vol. 21(6), 357-359.—60 undergraduates learned by the study-recall method of a serial list of 11 CVCs with the central item isolated in different degrees of perceptual enhancement: shape, shape and color, or shape, color, and size; the middle 3 items isolated; the middle 5 items isolated; or none isolated to a criterion of 2 consecutive errorless trials. Compared to the corresponding control items, significant facilitation of isolated item (I) occurred in all experimental conditions. The magnitude of facilitation of the I (6th item) increased as (a) the degree of perceptual enhancement increased, and (b) the number of surrounding Is decreased. The item immediately following I(s) was also significantly facilitated. Findings are accounted for in terms of E. J. Gibson's concepts of generalization and differentiation in verbal learning.—*Journal abstract.*

2257. Hudson, Robert L. & Davis, Jerry L. (Mississippi State U.) **Part-whole transfer of a categorizable word list.** *Psychonomic Science*, 1970 (Dec), Vol. 21(6), 331-332. 45 undergraduates learned a part list where the words could be placed into 1 of 4 B. J. Underwood and J. Richardson categories and were then transferred to the whole list containing all the words of the part list plus additional words from each category. 1 group was told prior to part list learning that the words could be categorized, and another group was never given this information. An additional control group was included to assess the effects of information, per se. Results of whole-list learning, which were in the predicted direction but generally nonsignificant, show a slight superiority for the group receiving information over the group not receiving information.—*Journal abstract.*

2258. Johnson, Ronald E. (Purdue U.) **Serial learning of narrative prose as related to the structural importance of the linguistic segments.** *Proceedings of the Annual Convention of the American Psychological Association*, 1971, Vol. 6(Pt. 1), 51-52.—Ranked linguistic subunits of a narrative folktale according to their structural importance. The serial learning of the linguistic segments was then related to their judged structural importance. Learners in Exp. I (N = 40 undergraduates) controlled the presentation rates themselves, while the presentation rates in Exp. II (N = 40 undergraduates) were controlled automatically. Regardless of the method of controlling the presentation rates, a strong relationship existed between the structural importance of the units and their remembering. Linguistic segments of high structural importance also were more often emitted as intrusions.—*Author abstract.*

2259. Oléron, G., Rivoal, C., Marquer, P., & Shun, J. (U. Paris at the Sorbonne, Experimental & Comparative Psychology Lab, France) **Effet d'un conflit entre l'attitude d'apprentissage et l'automatisme verbal.** [The effect of a conflict between learning attitude and verbal automatism.] *Bulletin de Psychologie*, 1969 1970, Vol. 23 (9-10), 583-590.—64 Ss were presented lists of word pairs varying in speed of presentation and in the number of repetitions. 1 group (L) heard 1 word every 6

sec., the other group (4R) had 4 repetitions, 1 every 1.5 sec. The word lists varied also in the strength of association of their pairs as well as in the direct and reversible association factor. Spacings (contiguity) of associate pairs within lists ranged from 5-23 interposed words. Response criteria were recall of words in any order (spontaneously) and recall in presented order. Recall was most efficient in the 4R group with spontaneous recall. The distance between associates did not influence recall efficiency, neither on random recall nor order recall. The 4R method as well as the order-recall task favored the reconstruction of associates by contiguity. The degree of association did not influence recall in either group. The effect of reversibility of associations interacted with the modes of presentation. Results are compared with those obtained by Broadbent and Glanzer and Cunitz, and theoretical issues are discussed.—R. E. Smith.

2269. Rimm, David; Roesch, Ronald; Perry, Ronald, & Peebles, Chris. (Arizona State U.) Effects of blank versus noninformative feedback and "right" and "wrong" on response repetition in paired-associate learning. *Journal of Experimental Psychology*, 1971(Apr), Vol. 88(1), 26-30.—Examined response repetition as a function of feedback type. 16 male and 16 female undergraduates were presented with a paired-associate learning task. Informationless feedback consisted of either the standard blank or a redundant reminder of the 2 response alternatives, with Ss informed in both cases that such feedback conveyed no information. Both types of feedback resulted in an equally strong tendency for S to repeat responses which they followed, with the probability of repetition only slightly less than that obtained for "right." "Wrong" resulted in marked response suppression. Findings on informationless feedback support A. M. Buchwald's view that blank feedback is functionally equivalent to "right" or "wrong" feedback which is forgotten.—*Journal abstract*.

Reinforcement

2271. Etaugh, Claire F., Kelliher, Richard J., & Stalling, Richard B. (Bradley U.) Reinforcement of verbal behavior by evaluative meaning words. *Psychonomic Science*, 1970(Dec), Vol. 21(6), 327-328.—Tested the generality of an earlier finding that evaluative meaning words function as reinforcers for children's instrumental motor learning. 45 male undergraduates served as Ss in a verbal conditioning task. Words rated as having positive, negative, or neutral evaluative meaning (EM) were presented contingent upon the use of self-referent pronouns and were later removed during extinction. Frequency of emission of self-referent pronouns (a) increased, following presentation of positive EM words and removal of negative EM words; (b) decreased, following removal of positive, and presentation of negative, EM words; and (c) was unaffected by

presentation or removal of neutral EM words. Results strengthen A. W. Staats's conclusion that EM words can function as reinforcers and punishers in instrumental tasks.—*Journal abstract*.

MEMORY

2272. ———. Modes of memory. *British Medical Journal*, 1970(Mar), Vol. 1(1569), 641-642.—A person's ability to remember is related to general intelligence, but not in a direct way and with exceptions. Functional and organic disorders which may impair the memory are discussed. Evidence related to the mechanism of memory is reviewed. Studies indicate that there are 3 memory storage processes.—S. R. Diamond.

2273. Anderson, Richard C. & Watts, Graeme H. (U. Illinois) Response competition in the forgetting of paired associates. *Journal of Verbal Learning & Verbal Behavior*, 1971(Feb), Vol. 10(1), 29-34.—Reports 2 experiments with 112 undergraduates in each, which investigated retroactive inhibition (RI) with paired associates learned under the A-B, A-C, the A-B, A-Br, or the A-B, C-D paradigm. 1st-list retention was assessed using 1 of 3 types of unpaced multiple-choice test. When each test item included the specific competing response from the 2nd list, there was a substantial amount of RI; whereas no RI appeared when test items entailed only 1st-list responses or noncompeting 2nd-list responses. Results are interpreted as evidence for specific response competition.—*Journal abstract*.

2274. Crouse, James H. (U. Delaware, Coll. of Education) Retroactive interference in reading prose materials. *Journal of Educational Psychology*, 1971(Feb), Vol. 62(1), 39-44.—Investigated retroactive interference phenomena with prose-learning tasks. Exp. I with 80 undergraduates dealt with the effects of interpassage similarity on retroactive interference. Interpassage similarity was defined in terms of list-generated questions which the successive passages answered. The passages were constructed so that, in successive passages, questions were different, similar, or identical, but always had different answers. No retroactive interference was found in the different condition, but approximately 40% retroactive interference was obtained in similar and identical conditions. Exp. II with 60 undergraduates supported the conclusion that the retroactive interference is not a result of failures of passage differentiation, and Exp. III with 60 undergraduates suggested that it is not a result of output phenomena.—*Journal abstract*.

2275. Doost, Rainer & Turvey, M. T. (U. Connecticut) Iconic memory and central processing capacity. *Perception & Psychophysics*, 1971(Mar), Vol. 9(3-A), 269-274.—Conducted 3 experiments to assess whether or not iconic memory is influenced by demands placed upon central processing capacity. In Exp. I, 2 23-28 yr. old males and 2 females with normal vision were required to store material in short-term memory while performing an iconic memory task. In Exp. II and III, 4 normal-sighted Ss performed an auditory classification task concurrently with iconic storage. The 3 experiments did not reveal any significant impairment of iconic memory as a function of performing a subsidiary task. Similarly, performance on the subsidiary tasks did not suffer as a result of the concurrent iconic memory task (17 ref.).—*Journal abstract*.

2276. Forrester, William E. & King, David J. (State University Coll. New York, Oswego) Effects of seman-

tic and acoustic relatedness on free recall and clustering. *Journal of Experimental Psychology*, 1971-
(Apr), Vol. 88(1), 16-19.—Varied semantic and acoustic
relatedness of words in a mixed-list design presented to
36 undergraduates. Free recall was significantly better
for semantic items than for acoustic or unrelated control
items. Acoustic relatedness had no effect on amount
recalled but did affect order of output. Significant
clustering occurred via the semantic dimension only.
Correlational analyses indicate that clustering of seman-
tic items was associated with higher recall of semantic
and nonsemantic components. No significant correla-
tions involving acoustic clustering were found.—*Journal*
abstract.

2277. Goldstein, Alvin G. & Chance, June E. (U. Missouri) **Visual recognition memory for complex configurations.** *Perception & Psychophysics*, 1971(Feb), Vol. 9(2-B), 237-241.—Previous studies of recognition memory for heterogeneous pictorial stimuli suggest an unusually large storage and retrieval capacity. In Exp. 1, 3 series of homogeneous pictures (faces, inkblots, snow crystals) were presented to 6 independent groups of Ss, and recognition was tested immediately or 48 hr. later. Accuracy and sex were related to stimulus configuration; at both time intervals, accuracy was best for faces and poorest for snow crystals. Levels of accuracy were below those attained in studies using heterogeneous arrays. The results of 2 other experiments suggest the relative unimportance of verbal mediation in recognition of homogeneous pictorial stimuli. (22 ref.)—*Journal abstract.*

2278. **Gorfeln, David S. & Blair, Claudia.** (New Coll., Natural Science Div.) **Factors affecting multiple trial free recall.** *Journal of Educational Psychology*, 1971- (Feb), Vol. 62(1), 17-24.—Tested 32 undergraduates on variety of material in multiple-trial free-recall paradigms, and over a number of single-trial free-recall lists. All Ss participated in a paired-associate and short-term memory experiment. Analysis showed relatively high correlations across materials of free-recall total score with a corresponding lack of correlation for subjective organization. A short-term memory score and a paired-associate learning score both correlated significantly with multiple-trial free-recall performance. A previous report that the correlation between free recall and paired associates was due to the fact that good paired-associate learners were good in subjective organization is not supported in this data. Significant practice effects were shown in several aspects of the total free-recall performance. (22 ref.)—*Journal abstract.*

formance. (22 ref.)—*Journal abstract.*
2279. Hunt, Karl. (U. Tennessee, Chattanooga) **Measuring clustering differences among categories in the same list.** *Behavior Research Methods & Instrumentation*, 1971(Mar), Vol. 3(2), 67-69.—Presents a method which allows category characteristics to be varied within Ss by using mixed lists, whereas previously only homogeneous lists could be employed. It is designed to measure only relationships among items actually recalled, not between those recalled and those not recalled.—*Journal abstract.* (U. California, Berkeley)

2280. Jensen, Arthur R. (U. California, Berkeley) **Individual differences in visual and auditory memory.** *Journal of Educational Psychology*, 1971(Apr), Vol. 62(2), 123-131. -Presented 100 undergraduates with a visual and auditory forms of a digit memory test in a counterbalanced order (auditory-visual group and visual-auditory group) under conditions of immediate and

10-sec delayed recall. 2 control groups of 25 undergraduates each were given exclusively either the visual or auditory test. Auditory memory was better than visual for immediate recall; the reverse was true for delayed recall, the interaction being significant beyond $p < .001$. Correlations between individual differences in auditory and visual memory, after correction for attenuation based on reliabilities obtained from the control groups, did not significantly differ from unity for either immediate or delayed recall. There was no evidence for individual differences as a function of sensory modality of the input. There was a significant ($p < .001$) interaction, however, between Ss and time of recall (immediate vs. delayed). (26 ref.)—*Journal abstract.*

2281. Kroes, William H. & Libby, William L. (Ohio State U.) **Conceptual encoding categories in free recall.** *Perceptual & Motor Skills*, 1971(Feb), Vol. 32(1), 267-269.—49 female students were administered a randomized list of 60 words, 15 from each of 4 different kinds of conceptual categories, 1 of which was from an exhaustive category and 3 from nonexhaustive categories. Results support the hypotheses that some conceptual categories are more powerful in facilitating free recall and a higher degree of clustering occurs in the more powerful conceptual categories. Contrary to expectations, an exhaustive category, such as all 3-letter words rhyming with "a," is not necessarily as powerful as a more nonexhaustive category, i.e., clothing words. —*Journal abstract.*

2282. Kupriyovich, L. **Rezervy pamyati.** [Reserves of memory.] *Nauka i Zhizn'*, 1970(Oct), Vol. 37(10), 65-72.—Surveys the facts which lead to the view that characteristic of the brain is its "huge reserves," only a very small portion of which are utilized. Methods for tapping these reserves are suggested. 1 D London

The psychology of memory—1968: A bibliography.
Perceptual & Motor Skills, 1971(Feb), Vol. 32(1), 99–
124.—644 contributions to the psychology of memory
and forgetting published during 1968 are listed alpha-
betically. *Journal abstract.*

2284. Madigan, Stephen A. & McCabe, Linda. (1 Southern California, Los Angeles) **Perfect recall and total forgetting: A problem for models of short-term memory.** *Journal of Verbal Learning & Verbal Behavior*, 1971(Feb), Vol. 10(1), 101-106.—Conducted 2 paired-associate probe experiments with 30 and 36 graduate and undergraduate students. The items in the last input position in 5-pair lists were recalled perfectly in immediate recall, but practically never in a subsequent delayed recall test. Other items in the list were recalled at intermediate levels in both tests. This "negative recency" effect in delayed recall occurred regardless of whether a pair had or had not been tested in immediate recall. **Results, at variance with predictions derived from some current models of memory, suggest that pairs in terminal input positions are deliberately not processed and stored by Ss in a manner allowing their later recall from long-term memory.**—*Journal abstract.*

2285. Meunier, Gary F., Stanners, Robert F., & Meunier, Jo A. (Ball State U.) Pronounceability, rehearsal time, and the primacy effect of free recall. *Journal of Experimental Psychology*. 1971(Apr), Vol. 88(1), 123-127. Assigned 84 undergraduates to 1 of 4 groups in a serial learning free recall task. The groups were designated by the rated ease of pronounceability of the materials and the presence or absence of a back-

wards counting task following each of the 1st 4 items. 2 presentation recall trials were given each of the 3 lists presented to S. Recall was superior for easy-to-pronounce items and sharp reductions in the primacy effect were produced by the counting task. This reduction did not appear with the difficult-to-pronounce items until the 2nd presentation recall trials. Results are compatible with a model for memory proposed by R. Atkinson and R. Shiffrin.—*Journal abstract.*

2286. Miller, Stuart. (Towson State Coll.) **Memory span effects in transfer.** *Proceedings of the Annual Convention of the American Psychological Association*, 1971, Vol. 6(Pt. 1), 39-40.—Studied the performance of 30 high- (H-MS) and 30 low-memory span (L-MS) undergraduates in positive transfer (A-B'), negative transfer (A-C), and control (C-D) conditions using paired-associate lists. A 1st-list superiority of H-MS over L-MS groups was found. On the transfer list, MS effects were found in the A-C and C-D conditions but not in the A-B' condition. It is concluded that although L-MS Ss make use of supplied mediators as well as H-MS Ss, L-MS Ss have particular difficulty in overcoming interference from previously established associative bonds.—*Author abstract.*

2287. Nelson, Thomas O. (Stanford U.) **Recognition and savings in long-term memory: Related or independent?** *Proceedings of the Annual Convention of the American Psychological Association*, 1971, Vol. 6(Pt. 1), 15-16.—27 Ss learned a 20-item paired-associate list to a criterion of 1 errorless trial, had a 4-wk retention interval, and returned for a recall test, recognition test, and relearning; during relearning, $\frac{1}{2}$ of the items remained the same as in original learning and $\frac{1}{2}$ were changed (A-B₂). Results: (a) during the retention test, recall was remarkably high (50% correct); and (b) although 49% of the incorrectly recalled items were recognized correctly, the savings effect during relearning was the same regardless of whether the incorrectly recalled item had been correctly or incorrectly recognized, implying that recognition is not a prerequisite for the savings effect.—*Author abstract.*

2288. Newman, Slater E. & Campbell, Ralph T. (North Carolina State U.) **A-B and B-A performance as functions of test instructions and reading order.** *Journal of Experimental Psychology*, 1971(Apr), Vol. 88(1), 57-59.—Conducted 2 experiments with 90 and 160 male undergraduates to evaluate the principle of associative symmetry advanced by S. Asch and S. Ebenholtz (see PA, Vol. 37:390). In Exp. I, a 2×2 design was used in which Ss were told that they would be given an A-B or a B-A test. At the end of training, $\frac{1}{2}$ the Ss in each treatment were tested in the A-B direction and the rest in the B-A direction. A-B performance was superior to B-A performance independent of the type of test which S was told he would get. In Exp. II, Ss in each treatment read the pairs aloud from right to left or from left to right. For Ss who read the items aloud from left to right, the results replicated those from Exp. I, i.e., the A-B mean was higher than the B-A mean. However, for Ss who read the items aloud from right to left, the B-A mean was higher than the A-B mean. Results do not support a principle of associative symmetry.—*Journal abstract.*

2289. Paivio, Allan. (U. Western Ontario, London, Canada) **Imagery and deep structure in the recall of English nominalizations.** *Journal of Verbal Learning & Verbal Behavior*, 1971(Feb), Vol. 10(1), 1-12.—Compared rated imagery and deep-structure complexity as

predictors of the free recall of English nominalizations in experiments with 79, 51, and 42 undergraduates, involving different lists, showed consistent positive effects of imagery but no effect of deep-structure complexity. Interactions of the 2 variables were inconsistent across experiments. A correlational analysis revealed that noun imagery alone was the best predictor of recall. Results suggest an imagery interpretation of memory for nominalizations. (26 ref.)—*Journal abstract.*

2290. Palmer, Stephen E. & Ornstein, Peter A. (U. California, San Diego) **Role of rehearsal strategy in serial probed recall.** *Journal of Experimental Psychology*, 1971(Apr), Vol. 88(1), 60-66.—Studied the effects of different rehearsal strategies in serial probed recall. In Exp. I, 32 undergraduates were instructed to rehearse list items either cumulatively (Group CR) or as paired associates (Group PA). The groups differed in the initial portion of the serial position curve, Group CR showing a large primacy effect, while Group PA showed none. In Exp. II with 64 undergraduates, immediate and delayed recall procedures were used to permit inferences concerning primary- and secondary-memory components of recall. The primacy effect for Group CR was again obtained under immediate recall conditions, and was somewhat reduced, but still significant under delayed recall conditions. Results are interpreted as indicating the importance of rehearsal strategies in determining memory performance and as supporting the position that rehearsal repetition both maintains primary memory traces and transfers information to secondary memory. (18 ref.)—*Journal abstract.*

2291. Ranschburg, Jenő. (Eötvös Lóránd U., Budapest, Hungary) **A verbális emlékezéshez kapcsolódó negatív és pozitív érzelmek fejlődésének vizsgálata galvanós bőrreflexszel.** [Examination of the trend of negative and positive emotions induced by verbal memory with the galvanic skin response.] *Pszichológiai Tanulmányok*, 1967, No. 10, 375-379.

2292. Rumery, Robert E. & Leicht, Kenneth L. (Illinois State U.) **Serial and free recall: Number and form of serial position functions as related to rehearsal and recall instructions.** *Proceedings of the Annual Convention of the American Psychological Association*, 1971, Vol. 6(Pt. 1), 13-14.—3 lists of 15 common words were presented 1 at a time for 4 trials to 136 Ss under 4 experimental conditions and analyzed using a factor-analytic procedure. When instructions allowed Ss to choose rehearsal strategies, recall performances were characterized by 3 serial-position functions in serial recall and by 2 functions in free recall. The 2 functions associated with free recall, free rehearsal and 2 of the 3 associated with serial recall, free rehearsal were interpreted as representing short- and long-term memory processes.—*Author abstract.*

2293. Senf, Gerald M. & Rollins, Howard A. (U. Illinois, Chicago) **Effect of precuing versus postcuing retrieval order of the accuracy of bisensory memory.** *Journal of Experimental Psychology*, 1971(Apr), Vol. 88(1), 12-15.—Presented trials of 6 digits arranged into 3 audiovisual pairs, the interpair interval being either $\frac{1}{2}$ or 2 sec. to 44 undergraduates. Groups were either precued to recall the items as 3 audiovisual pairs or as 2 modality sets and postcued to recall the items in forward or backward order or vice versa. Analysis of forward recall data found precuing improved accuracy for both pair and modality recall methods, particularly at the slow stimulus presentation rate. Parallel with dichotic listen-

ing data, modality order recall was superior at the fast rate, pair recall superior at the slow rate. Forward recall order was more accurate than backward order. The superiority of modality over pair order recall and the greater accuracy for fast over slow stimulus rates were attenuated when recall was in the backward order. Results suggest that at slow rates, S can modify the manner of item storage, while, at fast rates, stimulus rate is the primary determinant.—*Journal abstract.*

2294. Szmirnov, A. A. (Psychological Inst., Moscow, USSR) **Néhány korreláció az emlékezés terén.** [Certain correlations of memory.] *Pszichológiai Tanulmányok*, 1967, No. 10, 15-27.

2295. Weisberg, Robert W. (Temple U.) **The Influence of previously established associations on the storage of simple active sentences.** *Proceedings of the Annual Convention of the American Psychological Association*, 1971, Vol. 6(Pt. 1), 55-56.—Tested a semantic theory of sentence storage by obtaining intrasentence word associations (ISWA) from simple active sentences in which degree of preestablished associations among the words varied. Ss were 40 paid undergraduates. It was found that strong preestablished associations had little or no effect on ISWA patterns, which conformed to predictions based on semantic interpretation and thus replicated earlier studies. Associative strength as measured by free association plays little part in the actual storage of sentences, but may be important in reconstruction of a forgotten sentence at recall.—*Author abstract.*

2296. Weist, Richard M. (U. Nebraska) **"No-show" phenomena in free recall.** *Psychonomic Science*, 1970, (Dec), Vol. 21(6), 366. In a multitrial free-recall experiment, 14 undergraduates assigned to a free-recall group were compared with 10 Ss in a restricted-recall group who were instructed that all of the words would not be presented on each trial and that they must recall only the words that were presented. While, in fact, all of the words were consistently presented in both groups, recall performance was depressed in the specially instructed group.—*Journal abstract.*

2297. Wood, Gordon. (Michigan State U.) **Organization, large memory units, and free recall.** *Journal of Verbal Learning & Verbal Behavior*, 1971(Feb), Vol. 10(1), 52-56.—Utilized a whole-part transfer paradigm. In 2 experiments with 44 undergraduates each, to assess the effect of "forcing" Ss to reorganize large memory units. List 1 contained 18 categories of 3 words each, and List 2 contained 9 categories of 3 words each. Experimental Ss received all 27 List 2 words in List 1. Even though the within-category organization established during List 1 learning was appropriate for List 2 learning, the negative effect due to the inappropriate between-category organization offset or overpowered the positive effect of within-category organization. The effect of forcing Ss to reorganize memory units did not appear to depend on the size of the memory unit. It is suggested that it may be more accurate to conceptualize free-recall learning as the process of forming 1 large memory unit.—*Journal abstract.*

2298. Yuille, John C. (U. British Columbia, Vancouver, Canada) **Does the concreteness effect reverse with delay?** *Journal of Experimental Psychology*, 1971(Apr), Vol. 88(1), 147-148. Reports an attempted replication of a previous experiment by M. J. Butter (see PA, Vol. 44:11772) which reported a reversal with delay of the effect of stimulus concreteness on paired-associate

recall. An experiment with 32 undergraduates was unable to replicate the earlier finding. Together with data from 2 other experiments, considerable doubt is cast on the Butter results.—*Journal abstract.*

2299. Zerdy, Gerald A. (U. Maryland, Computer Science Center) **Incidental retention of recurring words presented during auditory monitoring tasks.** *Journal of Experimental Psychology*, 1971(Apr), Vol. 88(1), 82-89.—Presented lists of 1440 common English words by a tape recorder to 120 undergraduates. Ss were instructed to press a button whenever defined "target" words occurred. A group of 12 recurring words served as criterion items on subsequent tests of free recall and of recognition memory. 3 experimental variables were examined: (a) learning conditions (incidental or intentional), (b) orienting task (stimulus examination or memory examination), and (c) repetition frequency (7, 14, or 28). Results confirm the hypothesis that listening for semantically (i.e., categorically) defined target words would lead to greater incidental retention than would listening for a single target word. It was observed that (a) intentional learners retained more than incidental learners, (b) repetition facilitated retention to a greater extent for the incidental learners, and (c) effectiveness of the orienting task interacted with the conditions of learning. Results are discussed in terms of the information-processing requirements of the orienting tasks.—*Journal abstract.*

Short Term & Immediate Memory

2300. Adams, William A. (U. Wisconsin-Milwaukee) **Proactive interference in very short term memory.** *Proceedings of the Annual Convention of the American Psychological Association*, 1971, Vol. 6(Pt. 1), 41-42. Tested college students (N = 40 undergraduates in Exp. I, and 16 in Exp. II) for retention of tachistoscopically presented displays of consonant trigrams with retention intervals of 100, 200 or 300 msec. and a constant exposure period of 75 msec. Proactive interference was found to increase over trials for all retention intervals to about the same extent. When the III was filled with a neutral counting task, the proactive interference effects disappeared. Proactive interference results are interpreted in terms of verbal confusion arising during the III from Ss' attempts to "confirm" their uncertain perceptions of the stimulus materials.—*Author abstract.*

2301. Anders, Terry R. (Harvard Medical School, Boston, Mass.) **Retrospective reports of retrieval from short-term memory.** *Proceedings of the Annual Convention of the American Psychological Association*, 1971, Vol. 6(Pt. 1), 37-38. Studied retrieval processes in short-term memory by quantifying Ss' (N = 12 females from a nursing school) verbal reports of the number, location, and order of material covered during the memory search. The basic results are comparable to previous findings, i.e., the search was slow (about 5 items/sec), serial, and usually self-terminating. In addition, however, the Ss' search reports provided data on several aspects of the retrieval process previously unexplored. Among these were descriptions of (a) how the stored material was accessed, (b) the search preceding incorrect responses, and (c) how organization at the time of input affected retrieval.—*Author abstract.*

2302. Baddeley, A. D. & Scott, Denise. (U. Sussex, Experimental Psychology Lab, Brighton, England)

Word frequency and the unit sequence interference hypothesis in short-term memory. *Journal of Verbal Learning and Verbal Behavior*, 1971(Feb), Vol. 10(1), 35-40.—Examined experiments claiming to show unit-sequence interference in short-term memory. 4 experiments were performed with 40 enlisted men, 36 housewives, 30 students from a college of education, and 329 university undergraduates, to investigate the retention of high and low frequency words over filled intervals of 0-30 sec. Results show (a) better overall performance on high frequency sequences, and (b) parallel forgetting of high and low frequency sequences. It is concluded that unit-sequence interference is not an important variable in short-term memory. (17 ref.)—*Journal abstract*.

2303. Bartz, Wayne H. (Iowa State U.) **Successive responses to simultaneous and successive auditory stimuli.** *Proceedings of the Annual Convention of the American Psychological Association*, 1971, Vol. 6(Pt. 1), 81-82.—Compared the immediate memory for items presented simultaneously (dichotic listening) with memory for the same items presented successively. 20 undergraduate volunteers responded to 160 lists composed of 2 categories of items. Each list contained 6 items from 1 category and 2 from the other. The 2-item category was presented in successive pairs of serial positions in serial lists or simultaneously with 2 items in the 6-item category. Ss ordered their recall by categories. Results show that retention for serial and dichotic lists was identical. Dichotic listening, then, is but one means of structuring a list of verbal items.—*Author abstract*.

2304. Cimbalo, Richard S. (Rosary Hill Coll.) **Short-term memory: List length and the isolation effect.** *Proceedings of the Annual Convention of the American Psychological Association*, 1971, Vol. 6(Pt. 1), 35-36.—Placed digits in various positions of lists otherwise comprised of consonants. Lists containing either 6, 10, or 12 items were presented to Ss ($N = 45$ 15-19 yr. old high school students) for a single trial. Contrary to predictions derived from either or both interference and Gestalt theories: (a) overall performance between isolated and unisolated lists did not differ, (b) the isolation effect was not present at all positions, (c) the isolation effect and list length were not directly related, and (d) no evidence for a generalization gradient was found. An information processing theory with a time-dependent attentional mechanism was considered as an alternative.—*Author abstract*.

2305. Elmes, David G. & Adams, Carl. (Washington & Lee U.) **Related responses in short-term memory.** *Journal of Experimental Psychology*, 1971(Apr), Vol. 88(1), 140-141.—Utilized a running paired-associate task to examine the role of related responses in short-term memory. Potential retroactive and proactive inhibition effects were held constant across related-item conditions. 15 undergraduates were presented 45 lists in which there were 0, 1, or 2 responses related to a particular "critical" response. The presentation and recall loci of the related items were systematically varied. Correct recall of the critical responses increased with increases in the number of related responses, suggesting that Ss group related items for recall. The effects of presentation of locus of related responses were compatible with the idea of grouping for recall.—*Journal abstract*.

2306. Griffin, John L. (U. Alabama) **Presentation rate and intra-list interpolation in the sequential recall of letters.** *Dissertation Abstracts International*, 1971(Jan), Vol. 31(7-B), 4361-4362.

2307. Heisey, John A. & Duncan, Carl P. (Northwestern U.) **Syntactical encoding in short-term memory.** *Journal of Verbal Learning & Verbal Behavior*, 1971(Feb), Vol. 10(1), 95-100.—Hypothesized that when the same sentence structure is repeatedly used to encode different sentence contents, structural encodings of sentence contents would become confused and proactive inhibition (PI) would result. 192 undergraduates learned and recalled lists of nonsense words presented without sentence structure, or the same words embedded in key syntactical positions in active, passive, or interrogative voice sentences, for 3 trials. On Trial 4, all Ss learned and recalled nonsense words presented in an active voice sentence. In all conditions, recall decreased and PI increased from Trial 1-3. On Trial 4, (a) the group continuing with active voice showed further PI, (b) the word list group showed a high degree of recovery, and (c) the passive and interrogative groups showed intermediate amounts of recovery. The recovery from PI when sentence structure was introduced, or was changed from 1 voice to another, is taken to indicate use of syntax as an encoding cue for recall.—*Journal abstract*.

2308. Henderson, Leslie & Matthews, Michael L. (U. Guelph, Ontario, Canada) **Perception and memory loss of item and order information in short-term memory.** *Perception & Psychophysics*, 1971(Feb), Vol. 9(2-B), 231-233.—Recognition probes given before or after a series of letters presented at varying rates were used to evaluate perception and memory loss of order and item information ($N = 20$ Ss). For both order and item information pre- and postprobe functions converged at fast rates of presentation. Performance decrement at fast rates is attributable to perceptual factors and is greater for order than for item information.—*Journal abstract*.

2309. Irion, Arthur L., Boswell, John J., & Walker, James T. (U. Missouri, St. Louis) **Repetition effects in short-term memory.** *Psychonomic Science*, 1970(Dec), Vol. 21(6), 367-368.—Studied human short-term memory in an experiment with 64 female undergraduates, using repeated presentations of the stimulus materials. A consonant trigram was presented, rehearsal was prevented for a 20-sec interval, and the procedure was then repeated without allowing an attempted recall. A single recall test was given after the interval that followed the last presentation. Number of presentations (1, 2, 3, and 4) was the independent variable. Considerable increases in recall were obtained as number of presentations increased.—*Journal abstract*.

2310. Kellas, George & Butterfield, Earl C. (U. Kansas) **Effect of response requirement and type of material on acquisition and retention performance in short-term memory.** *Journal of Experimental Psychology*, 1971(Apr), Vol. 88(1), 50-56.—Employed multiple list tasks to examine the performance of 90 undergraduates during input and output phases of short-term retention. The duration of time Ss exposed successive items in the experimental lists was recorded for free, ordered, and probe recall. The resultant patterns of exposure durations across serial positions were compared to the patterns of correct responses during recall. Specific predictions concerning the nature of the stimulus material (single letters, bigrams, and trigrams) and the recall requirements were made from 2 current models of memory. Results demonstrate an inverse relationship between input and output performance. Comparisons among the various treatment conditions support the N.

C. Waugh and D. A. Norman model of memory (see PA, Vol. 39:9429).—*Journal abstract.*

2311. Scapinello, Ken F. & Yarmey, A. Daniel. (U. Guelph, Ontario, Canada) The role of familiarity and orientation in immediate and delayed recognition of pictorial stimuli. *Psychonomic Science*, 1970(Dec), Vol. 21(6), 329-331.—Examined the effects of familiarity and changes in stimulus orientation on immediate and delayed recognition of human faces, canine faces, and buildings. 80 undergraduates were assigned randomly to 1 of 4 experimental conditions: immediate or delayed recognition of stimuli presented and tested in the same orientation, and immediate or delayed recognition of stimuli presented and tested in opposite orientations. Results indicate that familiar stimuli presented for 7 successive inspection trials were significantly better recognized than were unfamiliar stimuli inspected only once. Recognition performance declined as a function of stimulus rotation and a 20-min delay in testing. This decline was significantly greater for human faces than for other stimuli, regardless of the recall interval used. It is concluded that increased familiarity improved recognition and that the disproportionate difficulty for rotated human faces was independent of familiarity.—*Journal abstract.*

THINKING

2313. Brown, Bill R. & Aylworth, Charles E. (U. Louisville) Feature encoding and pattern classifications with sequentially presented Markov stimuli. *Perception & Psychophysics*, 1971(Feb), Vol. 9(2-B), 203-207.—Attempted to develop and evaluate a methodology designed to permit more direct assessment of the detailed processes involved in prototype abstraction. 30 Ss participated in a task having the following characteristics: (a) classifications of Markov-generated stimuli sampled from 2 different populations, (b) controlled scanning of pattern features, (c) a measure of the degree to which pattern features were correctly identified, and (d) intermittent reproduction of pattern features abstracted from collections of mixed instances. Results showed that a significant number of the Ss learned to classify the stimuli into categories corresponding to the generation rules and, at least partially, abstracted the population prototypes from these variable instances. The feature identification data suggested that the Ss who were unsuccessful in classifying the stimuli into the rule-defined categories used an inappropriate strategy for sampling pattern information upon which to base their classifications. (15 ref.)—*Journal abstract.*

2314. Cairns, Helen S. & Foss, Donald J. (U. Texas) Falsification of the hypothesis that word frequency is a unified variable in sentence processing. *Journal of Verbal Learning and Verbal Behavior*, 1971(Feb), Vol. 10(1), 41-43.—Investigated the relationship of word frequency to sentential processing complexity. 32 undergraduates listened to sentences and pushed a button in response to a word beginning with a preestablished phoneme (target words), and RT was taken as an index of local processing difficulty. Lexical items immediately preceding the target words were manipulated: they were

either high or low frequency adjectives, nouns, or verbs. It was found that only low frequency adjectives produced longer RTs. No effect of word frequency on nouns or verbs was observed. An information entry hypothesis is proposed to account for the results.—*Journal abstract.*

2315. Carver, Ronald P. (American Inst. for Research, Washington, D.C.) Pupil dilation and its relationship to information processing during reading and listening. *Journal of Applied Psychology*, 1971(Apr), Vol. 55(2), 126-134. Investigated whether pupil diameter indicates information-processing load during reading and listening experiments involving 24 undergraduates reading passages of varying difficulty. A TV camera and monitor and a video recorder were used to measure the diameter of the pupil under a reading condition and 3 control conditions. No evidence was obtained that the pupil dilates while reading. Results were investigated by measuring the pupil size of 20 undergraduates while listening to tape recordings of the reading passages. No evidence was obtained that the pupil dilates while listening. Results suggest that pupil size cannot be used as an objective indication of whether or not an S is processing the information contained in connected discourse while he is engaged in reading or listening activities. The possibilities that the dilations occurred but were not reliably detected by the methods used is discussed.—*Journal abstract.*

2316. Dufoyer, Jean P. (U. Paris at the Sorbonne, School of Letters & Humane Sciences, France) Rôle de certaines habitudes verbales dans la conduite du raisonnement chez des adolescents et des adultes. [The role of certain verbal habits in the course of reasoning in adolescents and adults] *Bulletin de Psychologie*, 1969-1970, Vol. 23(9-10), 526-532. 41 adults and 41 students in psychology (13 male, 28 female) and 41 12-16 yr old boys were asked to identify statements represented by stick figures using a series of propositions such as "Roland is as heavy as Frederic. Roland is as tall as Oliver. Oliver is taller than Anthony. Frederic is heavier than Anthony." Significant differences between men and women and between adults and adolescents were found in the identifications made. Errors in identification by 1/2 of the adults and 2/3 of the adolescents indicated that they had understood the implied equality in "A is as [heavy/tall] as B" and not the implied inequality in "A is as [heavy/tall] as B" as in "A is as [heavy/tall] as B, but C is heavier/taller than B." These Ss did not understand that a statement "Paul is as tall as Peter" does not indicate whether they are actually both tall or short.—R. E. Smith

2317. Flowers, J. H. & Garner, W. R. (Yale U.) The effect of stimulus element redundancy on speed of discrimination as a function of state and process limitation. *Perception & Psychophysics*, 1971(Feb), Vol. 9(2-A), 158-160. The effect of spatially repeated stimulus elements on the speed of discrimination was measured in a sorting task (state limitation) and conditions of low stimulus similarity (process limitation) for 15 male college students. A significant increase in speed of sorting stimuli was found when the stimuli were state limited but not when process limited, even though base speeds were the same in both cases. It is concluded that element redundancy will improve discrimination performance only when the need for the improvement is a state limitation.—*Journal abstract.*

2318. Goldstein, Irwin I. & Allen, John C. (U.

Maryland) **Effects of irrelevant stimuli on the processing of information in complex displays.** *Journal of Applied Psychology*, 1971(Apr), Vol. 55(2), 110-113.—Investigated the effects of irrelevant stimuli on Ss' ability to organize information by using response categories. 40 undergraduates were assigned to relevant or relevant-irrelevant conditions. Irrelevant stimuli were found to increase response time and errors for all levels of complexity, but more so for certain specific response categories where interference effects could be expected.—*Journal abstract*.

(National Education Inst., Budapest, Hungary) **A Landa-vezérlési elv egy logikai modellje és alkalmazása gondolkodáslelektani vizsgálatokban.** [A logical model of Landa's control principle and its application in the psychological examinations of thought.] *Pszichológiai Tanulmányok*, 1967, No. 10, 259-265.

2321. Hoepfner, Ralph; Guilford, J. P., & Bradley, Paul A. (U. California, Los Angeles) **Information-transformation abilities.** *Educational & Psychological Measurement*, 1970(Win), Vol. 30(4), 785-802.—This investigation into the structure of intellect model focuses on the changing, revising, or redefining of information. 1 sex, 10 transformations, and 6 reference factors were hypothesized. Structure of intellect tests were administered to 197 senior high school students. A principal factors method was applied to the intercorrelations among the 47 structure of intellect measures. The hypothesized factors were retained for orthogonal rotation. Among the transformation factors appearing clearly were cognition of symbolic units, cognition of symbolic transformations, memory for symbolic transformations, divergent production of semantic classes, convergent production of semantic transformations, and evaluation of symbolic transformations.—*N. M. Chansky*.

2322. Miller, Gerald R. (Michigan State U.) **Some factors influencing judgments of logical validity of arguments: A research review.** *Quarterly Journal of Speech*, 1969(Oct), Vol. 55(3), 276-286.—Reviews studies dealing with the influence of variables on an S's judgment of an argument's logical validity. 4 classes of variables are distinguished: (a) structural form and/or semantic characteristics of an argument, (b) prior training of the S, (c) attitudinal state of the S, and (d) the cognitive style of the S. Research is recommended in the effect of channel variables, argument format, and the persuasiveness of logical arguments.—*S. Knapp*.

2323. Schulman, David & Shontz, Franklin C. **Body posture and thinking.** *Perceptual & Motor Skills*, 1971(Feb), Vol. 32(1), 27-33.—Ss were 8 groups of college students, 10 men and 10 women per group. Ss in each group were tested while in a standing, sitting-erect, sitting-bent, or supine posture. Enclosed box problems and the Uses of a Brick task were administered to 4 groups (1 group in each body posture). The other 4 groups were administered an abbreviated TAT, a task requiring S to talk about himself, and a test of memory for posture-related words. Ss were tested individually. Number of problems solved, pace of talking, number of self-referent statements, and proportion of posture-related words remembered were significantly affected by

posture. Sex differences were also significant for several measures. It is concluded that body posture influences several types of thinking and that the study of the influence of posture on behavior has theoretical value as well as implications for psychological testing, therapy, and education. (18 ref.)—*Journal abstract*.

2324. Simpson, W. E., Vaught, Glen M., & Ham, Marie L. (State University Coll. New York, Oswego) **Intercorrelations among imagery tasks.** *Perceptual & Motor Skills*, 1971(Feb), Vol. 32(1), 249-250.—Intercorrelations were obtained for 9 measures of performance by 30 adults in an attempt to assess any general ability reflected on those tasks involving visual imagery. Neither the direction nor the magnitude of the correlations gave strong support to the operation of such general ability.—*Journal abstract*.

2325. Wellens, A. Rodney & Thistlethwaite, Donald L. (Vanderbilt U.) **An analysis of two quantitative theories of cognitive balance.** *Psychological Review*, 1971(Mar), Vol. 78(2), 141-150.—Reviews previous attempts to formulate balance theories capable of accommodating interelement relations of varying magnitudes. 2 new algebraic formulations of the quantitative balance theories of N. T. Feather and W. M. Wiest are proposed. It is shown that the discrepancy principle used in the former theory contains an algebraic formulation which is equivalent to one that may be given for the upper boundaries of balance implied in the latter theory. Empirical results probing these theories provided some support for the algebraic formulation common to both theories, but disconfirmed the polarization principle which has been used as an adjunct to Wiest's geometric model. (17 ref.)—*Journal abstract*.

Problem Solving

2326. Davies, Ivor K. (Royal Air Force Coll., Cranwell, England) **Get immediate relief with an algorithm.** *Psychology Today*, 1970(Apr), Vol. 3(1), 53-54, 68-69.—Prose presentations of complex rules and procedures are very difficult to understand because prose must contain many qualifications and often cannot maintain the order best for comprehension. Changing the format to an algorithm containing only simple, yes-no decisions arranged in an efficient order can increase understanding and reduce errors in solving problems. Income tax regulations among many other sets of directions, could be rewritten as algorithms.—*E. J. Posavac*.

2327. Revlis, R., Lipkin, S. G., & Hayes, J. R. (Carnegie-Mellon U.) **The importance of universal quantifiers in a hypothetical reasoning task.** *Journal of Verbal Learning & Verbal Behavior*, 1971(Feb), Vol. 10(1), 86-91.—Presented 180 undergraduates belief-contravening problems which required a forced choice between accepting either a general law (all As are Bs) or a quantified statement of the form "All As are Bs) or a particular fact (This Y is a Z). Ss consistently rejected the fact in favor of the generality. Laws with the affirmative quantifier (all) were accepted more often than those with the negative quantifier (no). Generalities expressing class-inclusion (is a) were accepted more often than those expressing property assignment (has a). Laws with familiar content were accepted more often than those with unfamiliar content. It is concluded that the contexts for the assertions (definitional, empirical, and unspecified) contributed to the acceptability of the gen-

each. Prior to each presentation, Ss predicted which of 2 symbols they expected (dimension what), and in which of 2 locations it would appear (dimension where). Following each presentation, some Ss identified what; others identified where. For each response and incentive condition CRS was fastest following the most probable dimension combination, and when both stimulus dimensions were correctly predicted. With an incentive for correct what predictions, CRS to identify where was markedly decreased.—*Author abstract.*

2337. Harris, Richard J. (U. New Mexico) **An interval-scale classification system for all 2×2 games.** *Proceedings of the Annual Convention of the American Psychological Association*, 1971, Vol. 6(Pt. 1), 219-220.—An extension of R. J. Harris' (see PA, Vol. 43:7509) classification system permits classification of the interval-scale properties of any 2×2 (2 person, 2 choice) game. The system is compared to taxonomies developed by Rapoport and Guyer, H. Hamburger (see PA, Vol. 43:7509), and Harris. It is shown to permit compact description of any 2×2 game as an octet of numbers. It also permits rapid classification of comparisons among game matrices with respect to the strength of measurement which must be assumed for the comparison to be meaningful.—*Author abstract.*

2338. Lichtenstein, Sarah & Slovic, Paul. (Oregon Research Inst., Eugene) **Reversals of preference between bids and choices in gambling decisions.** *Oregon Research Institute Research Bulletin*, 1970(Oct), Vol. 10(7), 1-27. Ss in 3 experiments chose their preferred bet from pairs of bets, and later bid for each bet separately. In each pair, 1 bet had a higher probability of winning (P bet); the other offered more to win (\$ bet). Bidding method (selling vs. buying) and payoff method (real-play vs. hourly wage) were varied. Results showed that when the P bet was chosen, the \$ bet often received a higher bid. These inconsistencies violate every risky decision model, but can be understood via information-processing considerations. In bidding, S starts with amount to win and adjusts it downward to account for other attributes of the bet. In choosing, there is no natural starting point. Thus, amount to win dominates bids but not choices. One need not call this behavior irrational, but it casts doubt on the descriptive validity of expected utility models of risky decision making.—*Journal abstract.*

2339. Liebllich, Amia; Liebllich, Israel, & Sevin, Judith. (Hebrew U. of Jerusalem, Israel) **Arithmetical estimation "ad absurdum."** *Perceptual & Motor Skills*, 1971(Feb), Vol. 32(1), 143-150.—An "absurd" arithmetical estimation task, which totally eliminated any skill facet, was used to test the hypothesis that only when any application of known algorithms is clearly impossible, do Ss take into account shifts in payoff matrices in their decision processes. Psychology students' behavior in this absurd task was compared with that of Ss in a previously described arithmetical estimation task under severe time restrictions. 10 Ss comprised the experimental group while 6 Ss served as controls, each S performing 150 decisions. 5 experimental Ss showed the expected rational shift in their behavior; there were no shifts by controls. Ritualistic skill-based strategy under adverse environmental conditions is discussed.—*Journal abstract.*

2340. McDaniel, Clyde O. (U. Pittsburgh) **Expectations and desires.** *Psychology*, 1970(Nov), Vol. 7(4), 2-26.—Based on J. Nehnevajsa's decision orien-

tation theory, the present study explored the relationship between expectations and desires, its influence on decision-making, and the demographic, temporal, and behavioral factors in decision orientations. Orientations are rooted in an individual's definition of outcomes, and the resulting decisions may be probability oriented, negative-desirability oriented, positive-desirability oriented, or utility oriented. It was hypothesized that: (a) probability evaluations are significantly effected by desirability evaluations at specific points in time; (b) this relationship is maintained over time; (c) this effect is influenced by the relevant information-seeking strategy employed; and (d) sex, age, race, marital status, nationality, education, and political party affiliation do not affect the probability-desirability relationship at points in time or over time. Random samples were obtained from an urban Negro Baptist church, a list of faculty members from an elementary school and a high school, and a white Republican organization. Results stress the importance of temporal factors and their socio-psychological correlates in probability and desirability evaluations. Demographic findings are reported. It is concluded that Nehnevajsa's theory is substantiated, that "some people act mainly on what they expect; others, on what they desire; still others on what they would like to prevent. This means that the various ways of characterizing the future do not play the same role in decision making." (16 ref.)—P. Zell.

2341. Shanteau, James C. (U. California, San Diego) **Component processes in risky decision judgments.** *Dissertation Abstracts International*, 1970(Dec), Vol. 31(6-B), 3739.

2342. Teger, Allan I. & Kogan, Nathan. (U. Pennsylvania) **The effect of reciprocal decision rule on decisions for another person.** *Proceedings of the Annual Convention of the American Psychological Association*, 1971, Vol. 6(Pt. 1), 247-248.—Ss made decisions on a gambling task where the outcome would affect their own payoff or the payoff of another person. Contrary to popular expectation, decisions for other people were no more cautious than decisions for oneself. Decisions for others became significantly more cautious when the S believed that the other person was making reciprocal choices which would affect the S's payoff. This was interpreted as due to either increased empathy in the reciprocal condition or an attempt to match an expected cautious choice from the other person. Friendship with the other person had no effect on the level of caution chosen for him.—*Author abstract.*

2343. Wallsten, Thomas S. (U. North Carolina, L. L. Thurstone Psychometric Lab., Chapel Hill) **Subjectively expected utility theory and subjects' probability estimates: Use of measurement-free techniques.** *Journal of Experimental Psychology*, 1971(Apr), Vol. 88(1), 31-40. Conducted an experiment to provide measurement-free tests (a) of SEU theory based on the principle of additivity, and (b) of the common assumption that Ss' probability estimates differ from their subjective probabilities inferred from SEU theory by no more than a scale factor. 2 male and 2 female summer college students estimated probabilities of random events used in 31 pairs of gambles. SEU theory accounted for the empirically established indifference of each S within error limits. Each S's estimates were close to his inferred subjective probabilities; 1 analysis supported the assumption that they differed by no more than a scale factor, while another rejected it.—*Journal abstract.*

2345. **Haider, Ijaz & Oswald, Ian.** (U. Edinburgh, Scotland) **Late brain recovery processes after drug overdose.** *British Medical Journal*, 1970(May), Vol. 2(5705), 318-322.—Though recovery of consciousness after drug overdose may occur within a day or 2, the drug itself may not finally leave the brain for another 1-3 wk., and at this late time a withdrawal syndrome can occur, with insomnia, restlessness, raised paradoxical REM sleep, epileptic phenomena, and even delirium. It is proposed that a high degree of drug tolerance and dependence can be rapidly acquired after overdose. 10 case histories are presented. Abnormal sleep features of the patients resolved only slowly over a period of up to 2 mo. after overdose. Data support the view that REM sleep is concerned with processes of brain repair. —*Journal abstract.*

2346. **Lelord, Gilbert.** (Medical Faculty, Bretonneau Hosp., Tours, France) **Aspects psychophysiologiques de l'acquisition et de la mémoire.** [Psychophysiological aspect of acquisition and of memory.] *Revue de Psychologie et des Sciences de l'Éducation*, 1970, Vol. 5(4), 448-468.—Presents a historical review of the evolution of the problem of acquisition and memory from a psychological viewpoint, and summarizes classical methods for observing acquired responses in man and animal. Contributions of anatomophysiological and electrophysiological techniques to the problem of acquisition are emphasized. Biochemical, physical, and mathematical aspects of acquisition are also analyzed. A possible application of the experimental data to psychiatry is suggested. 2347. **Moorcroft, William H., Lytle, Loy D., & Campbell, Byron A.** (Nebraska Psychiatric Inst., Omaha) **Ontogeny of starvation-induced behavioral arousal in the rat.** *Journal of Comparative & Physiological Psychology*, 1971(Apr), Vol. 75(1), 59-67.—Measured spontaneous locomotor activity of 276 and 4 male Sprague-Dawley neonatal and weanling rats in stabilimeter activity cages scaled to the size of the Ss under a wide range of temperature and food-deprivation conditions. Activity was low for the 1st 10 days of life and then increased sharply, reaching a peak nearly 10 times that of normal adult animals 15-20 days postpartum. Activity then declined rapidly to near-adult levels by 28 days of age. This change in activity levels is correlated with major ontogenetic changes in the structure and functioning of the CNS. It is suggested that these changes may reflect a caudal-rostral sequence of development, in which brainstem excitatory centers and their afferent inputs mature earlier than do the more phylogenetically advanced telencephalic inhibitory centers. (32 ref.)—*Journal abstract.*

2348. **Richelle, Marc.** (U. Liège, Belgium) **Biological clocks.** *Psychology Today*, 1970(May), Vol. 3(12), 33-35, 58-60.—Rhythmic activity is exhibited almost universally by living things. Fruit flies hatch on a regular circadian rhythm and cats learn and retain reinforcement schedules for at least 2 mo. There is some reason to

suspect that these rhythms may develop from biochemical reactions at the cellular level. An unsolved problem concerns how physiological rhythms are related to the experience of time. This problem has relevance for globally mobile people and, even more, for people traveling in space.—*E. J. Posavac.*

2351. **Zucker, Irving.** (U. California, Berkeley) **Light-dark rhythms in rat eating and drinking behavior.** *Physiology & Behavior*, 1971(Feb), Vol. 6(2), 115-126.—In 3 experiments with 200 Sprague-Dawley and Long-Evans rats, it was found that following blinding there was a rapid and sustained increase in eating and drinking during the light portion of a light-dark (L-D) cycle. Group nocturnal rhythms in eating and drinking were retained in attenuated form for at least 10 days; 60 days after blinding these rhythms were absent. For sighted Ss the food/water ratio was 3 times greater during the light than during the dark; this difference was greatly reduced almost immediately after blinding. Continuous illumination almost immediately suppressed water intake and abolished group nocturnal rhythms in eating and drinking within 9-11 days. Nocturnal eating and drinking rhythms reentrained within 7-9 days following an inversion of the L-D cycle. Ss blinded between 12 and 36 hr. after such an inversion remained residually entrained to the original L-D cycle for at least 1 mo., but Ss blinded at 48-120 hr. reentrained to the new cycle. These differences persisted for surprisingly long times and suggest that the initial period following a change in environmental illumination is most critical for reentrainment of eating and drinking which may then proceed relatively normally in the absence of further visual stimulation. Nocturnal patterns of drinking were present in essentially adult form in Ss 23 days old; blinding on Day 14 but not on Day 18 or later prevented the appearance of these rhythms. The early perinatal period was not critical for entrainment of eating and drinking rhythms since Ss 1st exposed to alternating L-D patterns of illumination at 59 days of age displayed nocturnal behavior patterns shortly thereafter. The influence of daytime feeding schedules on nocturnal drinking patterns is described and the neural basis for rhythmic light-dependent behavior considered (22 ref.) —*Journal abstract.*

NEUROLOGY

2352. **Bradley, P. B. & Candy, J. M.** (Medical Research Council, Neuropharmacology Unit, Birmingham, England) **Iontophoretic release of acetylcholine, noradrenaline, 5-hydroxytryptamine and D-lysergic acid diethylamide from micropipettes.** *British Journal of Pharmacology*, 1970(Oct), Vol. 40(2), 194-201.—The in vitro iontophoretic release of tritium-labeled acetylcholine and 5-hydroxytryptamine from large and small micropipettes and noradrenaline and LSD from small micropipettes was determined by liquid

scintillation counting. The release was directly proportional to the electrical charge passed in the range normally used in the iontophoretic study of these compounds. The transport numbers obtained for the large micropipettes were approximately double those with the small micropipettes. A very low transport number was found for LSD. The spontaneous leakage was small and did not vary appreciably with time. The iontophoretic release of acetylcholine in vitro agreed with the in vitro measurements. The brainstem tissue concentration of LSD after iv injection into 3 intact and 4 decerebrate cats was determined.—*Journal abstract.*

2353. Burbaeva, G. Sh. & Lozovskii, D. V. (Inst. of Psychiatry, Moscow, USSR) *K immunokhimicheskomu issledovaniyu belkov mozga cheloveka.* [On an immunochemical study of the proteins of the human brain.] *Vestnik Akademii Meditsinskikh Nauk SSSR*, 1971(Jan), Vol. 26(1), 50-55.—Studied the protein composition of the gray and white matter in different lobes of the human cerebral hemispheres, using differential disk-electrophoresis on polyacrylamide gel. Differences in the protein composition between gray and white matter were disclosed, but no relationship was discerned between protein composition and individual lobes. The protein composition of the cortical gray matter was studied analogously. Precipitation tests showed that cortical gray matter contained minimally 7 antigens, of which several were identical with those found in human serum and liver, 3 were organo-specific, and 1 was, to all appearances, species-specific. 2354. Gardner-Medwin, A. R. (University College, London, England) *Modifiable synapses necessary for learning.* *Nature*, 1969(Aug), Vol. 223(5209), 916-919.—Elaborates a system in which most modifiable synapses "can in principle be the mechanism underlying memory in a network similar... to the nervous system," even where the synaptic modification is not long lasting. It is argued that even the simplest types of synaptic modification could provide the basis of both long- and short-term memories if events are coded in the nervous system as bursts of impulses rather than single spikes. (18 ref.)—*S. Appelle.*

2355. Hanus, Marguerite & Boisacq-Schepens, Nicole. (U. Louvain, Neurophysiology Lab., Belgium) *Mécanismes neurophysiologiques du mouvement.* [Neurophysiological mechanisms of movement.] *Revue de Psychologie et des Sciences de l'Education*, 1970, Vol. 5(4), 381-394.—In this approach to the problem of motor function, a 1st question concerning its localization is asked. At each level of the CNS the pathways of motor outputs and sensory inputs are described. A 2nd question dealing with function is then considered. It is shown that from the lowest to the highest level of the CNS, a more and more perfect sensorimotor integration is progressively accomplished in view of the elaboration of a well adapted movement. (Flemish summary) (2 p. ref.)—*English summary.*

2356. Ison, James R. & Leonard, Dale W. (U. Rochester) *Effects of auditory stimuli on the amplitude of the nictitating membrane reflex of the rabbit (Oryctolagus cuniculus).* *Journal of Comparative & Physiological Psychology*, 1971(Apr), Vol. 75(1), 157-164.—Describes a series of 5 experiments with a total of 64 New Zealand rabbits. Results provide temporal and intensity data on the dynamic laws of the reflex, describing the time course of facilitation and inhibition

of the nictitating membrane reflex as determined by preceding momentary and prolonged auditory stimulation. Prolonged stimulation provided facilitation which (a) was directly related to stimulus intensity, (b) increased in an S-shaped function following stimulus onset, and (c) declined in a negatively accelerated decay function following stimulus offset. Momentary stimulation provided inhibition which: (a) was inversely related to stimulus intensity, and (b) was nonmonotonically related to time since stimulus offset, 1st increasing, then decreasing in extent as the interval increased. Since reflex modification occurred in the absence of any reliable evidence for conditioning, implications for the conditioned diminution phenomenon in classical conditioning are discussed.—*Journal abstract.*

2357. Lachman, Sheldon J. (Wayne State U.) *Learning and brain function: A theory of neural facilitation and defacilitation.* *Proceedings of the Annual Convention of the American Psychological Association*, 1971, Vol. 6(Pt. 1), 59-60.—Of the variety of responses which occur as a consequence of stimulation in an instrumental learning situation, those leading to reward provide excitations to a facilitating neural center, the effects of which are to strengthen the connections between neurons in the sequence leading to the rewarded response. Those leading to punishment provide excitations to a defacilitating neural center, the effects of which are to weaken the connections between neurons in the sequence leading to the punished response. Multiple alternative routes, between particular stimulation and particular response, are simultaneously established and at different CNS levels.—*Author abstract.*

2358. Vanderwolf, C. H. (U. Western Ontario, London, Canada) *Limbic-diencephalic mechanisms of voluntary movement.* *Psychological Review*, 1971-(Mar), Vol. 78(2), 83-113.—Data from a series of brain-behavior experiments utilizing techniques of ablation, ICS, and electrical recording emphasize the importance of the concept of levels of function in understanding behavior. Initiation, performance, and cessation of voluntary behaviors (e.g., walking, manipulating objects) are associated with activation of ascending pathways from the diencephalon to the hippocampus and neocortex. More automatic behaviors (e.g., chewing, emotional expression) are not directly dependent on these pathways, even when they occur as CRs. Electrical recordings indicate that hippocampal activity, in particular, is closely related to behavior. Wave morphology, amplitude, and frequency, are all related to different aspects of concurrent motor activity. Problems of the definition and mechanism of "voluntary" and "automatic" control of movement are discussed. (7 p. ref.)—*Journal abstract.*

2359. Willows, A. O. (U. Washington) *Giant brain cells in mollusks.* *Scientific American*, 1971(Feb), Vol. 224(2), 68-75. *Tritonia diomedea*, a sluglike nudibranch, has brain cells which can be individually identified because of large size and distinctive color. Tritonia's stereotyped instinctive escape reaction renders it useful for behavioral research. Experiments were conducted to determine the sources of sensory signals to each of several cells, the paths followed by signals along the cells' axonal branches, intercellular interactions, and roles played by various cells in the regulation of behavior. White brain cells apparently influence growth, development, or general behavioral state, but do not

directly affect motor activities. Orange-colored cells are involved in motor activity in a highly predictable fashion. Results support the conclusion that Tritonia's movement sequences are driven by built-in CNS circuits, rather than by reflex chains.—P. Tolin.

2360. Young, J. Z. (University Coll., Medical School, London, England) **What can we know about memory?** *British Medical Journal*, 1970(Mar), Vol. 1(5697), 647-652.—While knowledge about the brain is often seen as central to the problem of memory, little thought has been given to exactly what kind of knowledge about the brain would actually help us to understand memory. The memory system of the octopus is discussed particularly in relation to understanding the relationship between a memory system and a reflex system. The role of classifying systems in memory is discussed and applied to the problem of production and recognition of human speech. The role of association areas, based on evidence of the effects of lesions, is assessed. The role of the elimination of connections producing unwanted alternative possible responses is stressed. The code of the brain and the sets of neurons of which it is made is still unknown to man. It is suggested that the memory system may consist not of isolated separately addressed pieces but of one unified system.—S. R. Diamond.

Neuroanatomy

2361. Blomfield, Stephen & Marr, David. (Inst. of Psychiatry, De Crespigny Park, London, England) **How the cerebellum may be used.** *Nature*, 1970(Sep), Vol. 227(5264), 1224-1228. —3 factors—(a) new anatomical information concerning the origin of the cortico-olivary and cortico-pontine projections; (b) the discovery that olivo-cerebellar fibers branch; and (c) the prediction that these fibers can organize more than simple memorizing phenomena—are related to new input-output relations for the cerebellum, and implications about the role of motor cortex in the learning and control of voluntary movements. It is argued that "the small, superficial pyramidal cells of the cerebral cortex detect incompatibilities in the current deep pyramidal cell activity, and that they modify the behaviour of the cerebro-cerebellar-cerebral loop to cope with this."—S. Appelle.

LESIONS

2363. Buerger, A. A. & Fennessy, A. (U. California, Irvine) **Long-term alteration of leg position due to shock avoidance by spinal rats.** *Experimental Neurology*, 1971(Feb), Vol. 30(2), 195-211. —Studied female Long-Evans rats with thoracic or lumbar spinal cord transections. In Exp. I, 9 Ss received shocks whenever they lowered an electrode attached to 1 hind foot into an electrolyte bath; yoked-control Ss received the shocks along with the experimental Ss. Experimental Ss consistently held the foot with the electrode above the electrolyte. During the early minutes of the 2nd phase, a testing situation, in which the experimental and control Ss were both shocked for leg lowering, the experimental Ss received fewer shocks than the controls; the controls eventually withheld the foot. In Exp. II, 4 Ss served as their own controls with 1 hind leg as a yoked control for

the other. Results were analogous, although the differences between the experimental and control legs were less distinct. Results suggest that the lumbosacral spinal cord of mammals relates shock to leg position and directs the leg to avoid shock when leg position is contingent on shock. It is concluded that the spinal cord might be used as a simple system for the study of mammalian learning. (24 ref.)—*Journal abstracts*.

2364. Frumkin, Kenneth. (McGill U., Montreal, Quebec, Canada) **Interaction of LiCl aversion and sodium-specific hunger in the adrenalectomized rat.** *Journal of Comparative & Physiological Psychology*, 1971(Apr), Vol. 75(1), 32-40. —Studied 84 adrenalectomized and 42 sham-adrenalectomized male hooded rats having prior experience with either (a) preoperative LiCl, (b) postoperative NaCl, (c) both preoperative LiCl and postoperative NaCl, or (d) neither of these experiences. Sham-operated Ss exposed to LiCl consistently avoided NaCl; adrenalectomized Ss did not. The deaths of 21 adrenalectomized Ss were attributed to the increased toxicity of LiCl for these Ss coupled with an increased tendency for them to drink it. No differences were found between groups of adrenalectomized Ss which had tasted LiCl and groups which had had it stomach-loaded. It is concluded that adrenalectomized rats regulate their salt intake on the basis of need alone. (19 ref.)—*Journal abstracts*.

Brain Lesions

2366. Butler, C. R. (University Coll., Medical Research Council Cerebral Functions Research Group, London, England) **Different effects of temporal lobe lesions on learning of visual pattern discriminations and of a visuomotor coordination task.** *Experimental Neurology*, 1970(Aug), Vol. 28(2), 356-364. —Examined whether learning of a visual guidance response was impaired as severely as pattern-discrimination learning by lesions of the inferior temporal neocortex. 3 groups of 2 split-brain rhesus monkeys were used: (a) Ss who also sustained unilateral removals of the inferior temporal area and the hippocampus, (b) Ss who later received the unilateral lesions and were retrained on the task, and (c) controls. Ss were taught to retrieve a peanut from a revolving container using only 1 eye and the contralateral hand. It was found that (a) the majority of the Ss were more proficient on the final session than on the 1st, indicating that learning had taken place, (b) that learning for the 2 hemispheres did not differ, except for isolated sessions, and (c) that the level reached by the b group was not lost following damage. It is concluded that the learning seen in this experiment does not depend on the temporal lobe structures in the same way as pattern discrimination learning.—*Journal abstracts*.

2367. Casseday, John H. (Indiana U.) **Auditory localization: The role of the brainstem auditory pathways of the cat.** *Dissertation Abstracts International*, 1971(Jan), Vol. 31(7-B), 4356-4357.

2368. Deagle, John H. (U. Tennessee) **One-way and shuttle avoidance acquisition and reversal in two strains of septal rats.** *Dissertation Abstracts International*, 1971(Jan), Vol. 31(7-B), 4358.

2369. Entingh, Daniel. (U. North Carolina, Medical

School, Chapel Hill) **Perseverative responding and hyperphagia following entorhinal lesions in cats.** *Journal of Comparative & Physiological Psychology*, 1971(Apr), Vol. 75(1), 50-58.—Reports 2 experiments with 17 and 10 cats on the effects of entorhinectomies on passive-avoidance behavior. It was found that Ss with large bilateral lesions limited to entorhinal cortex were (a) impaired on the reversal but not the original learning of position habits, (b) displayed deficient passive-avoidance behavior, (c) were hyperactive in the open field, and (d) were hyperphagic for some days after the surgery. The lesions had no effect on the acquisition or the punishment extinction of a 1-way active-avoidance response. Control experiments showed that effects of entorhinectomy on position-habit reversals and open-field activity were not secondary to hyperphagia. The pattern of behavioral deficits suggests that the entorhinal region participates in the suppression of appetitively reinforced responses but not in the suppression of aversively reinforced responses. (23 ref.)—*Journal abstract*.

2370. Goodman, Edward D., Jansen, Paul E., & Dewsbury, Donald A. (Emory U.) **Midbrain reticular formation lesions: Habituation to stimulation and copulatory behavior in male rats.** *Physiology & Behavior*, 1971(Feb), Vol. 6(2), 151-156.—In an experiment with 30 male Long-Evans rats, Ss with lesions in the midbrain reticular formation did not habituate in a measure of reactivity to handling stimuli as did operated controls and normals. Comparison of pre- and postoperative copulatory behavior in Ss with midbrain reticular formation lesions, and copulatory behavior in control operates and normals revealed that the midbrain lesions left copulatory behavior essentially intact except for some increase in the latency to the 1st mount. (22 ref.)—*Journal abstract*.

2371. Gotsick, James E., Osborne, Francis H., Allen, Carole J., & Hines, Kenneth M. (Morehead State U.) **Factors affecting performance on a shock escape task in rats with septal lesions.** *Physiology & Behavior*, 1971(Feb), Vol. 6(2), 199-201.—Compared 7 male albino Wistar rats with septal lesions to 7 operated controls on a shock escape task. It was found that little difference existed between the groups initially but the control group decreased the latency of responding over days, while the septal Ss exhibited little change. As a result, the control group was significantly superior to septals in the later stages of testing. An analysis of incidental behavior indicated that the amount of time spent holding the bar paralleled performance on the escape task. The inferior performance of the septal group appeared to be secondary to a failure to remain at the bar during the ITI. It is suggested that this behavior is consonant with a response disinhibition hypothesis of septal lesions, and that incidental behavior may be an important factor in other types of behavioral experiments.—*Journal abstract*.

2372. Isaacson, Robert L. (U. Florida) **When brains are damaged.** *Psychology Today*, 1970(Jan), Vol. 3(8), 38-42.—The effects of early relative to late brain damage were explored in research with cats. Ss were operated on either on the day of birth, at 6 wk. or 3 mo. of age, or as adults. At the age of 1½ yr. Ss began 6-12 mo. of training and testing. On some tasks there apparently was some compensation for early brain damage. Other tasks, however, could not be learned regardless of when the damage occurred. The brains of the cats were then examined. The function of supportive cell reactions in

the brain is not understood although it appeared that the animals performed better in their absence.—E. J. Posavac.

2373. Levinson, Daniel M. (U. South California) **Monocular acquisition and interocular transfer of two types of discriminations in normal and corpus callosally-sectioned guinea pigs.** *Dissertation Abstracts International*, 1970(Dec), Vol. 31(6-B), 3731-3732.

2374. Manning, Frederick J. (Walter Reed Army Medical Center, Washington, D.C.) **Punishment for errors and visual-discrimination learning by monkeys with inferotemporal cortex lesions.** *Journal of Comparative & Physiological Psychology*, 1971(Apr), Vol. 75(1), 146-152.—Trained 3 normal monkeys and 6 monkeys with bilateral lesions of inferotemporal or foveal prestriate cortex on a series of 8 simultaneous visual discriminations. Training was accomplished (a) solely with positive reinforcers, or (b) with positive reinforcers and electric-shock punishment for errors. With training a, lesioned Ss made significantly more errors than normal Ss, the foveal prestrates being slightly more impaired than the inferotemporals. With training b, the inferotemporals were indistinguishable from the normals, whereas the foveal prestrates Ss made significantly more errors than either of the other groups.—*Journal abstract*.

2375. Massopust, L. C., Wolin, L. R., & Frost, V. (Cleveland Psychiatric Inst., Lab. of Neurophysiology, O.) **Increases in auditory middle frequency discrimination thresholds after cortical ablations.** *Experimental Neurology*, 1970(Aug), Vol. 28(2), 299-307.—Trained 7 male rhesus monkeys to respond to 2 tones (4000 and 5000 Hz.) above selected criterion using frequency discrimination conditioned avoidance procedures. The 4000-Hz tone was increased in frequency through a series of steps approaching 5000 Hz. 5 Ss reached relative frequency discrimination thresholds of 30-50 Hz., 1 reached 60 Hz., and another 125 Hz. 4 Ss having preoperative thresholds of 30-150 Hz. showed remarkable increases in relative thresholds after cortical ablation (400-900 Hz.). Cortical lesions were located in the middle 1/3 of the superior temporal gyrus, including damage to the opercular and insular cortices. 2 other Ss. in which superficial and minimal cortical removals were performed, showed no increase in threshold. 1 S with bilateral ablations performed in the superior 1/3 of the superior temporal gyrus demonstrated minimum increase in threshold of 100 Hz. It is concluded that as the test frequencies reach higher levels a greater area of auditory cortex is needed for criterion discrimination performance.—*Journal abstract*.

2376. Peters, Michael & Monjan, Andrew A. (U. Western Ontario, London, Canada) **Behavior after cerebellar lesions in cats and monkeys.** *Physiology & Behavior*, 1971(Feb), Vol. 6(2), 205-206.—Reports that lesions of the cerebellar vermis in cats and squirrel monkeys have a taming effect. The lesions extended from the declive to the pyramis and produced slight but persistent changes in some aspects of motor behavior.—*Journal abstract*.

Brain Hypothalamic & Hippocampal Lesions

2380. Casebolt, Stephen D. (Illinois Inst. of Technology) **Extinction as a function of hippocampal lesions and acquisition training.** *Dissertation Abstracts International*, 1971(Jan), Vol. 31(7-B), 4356.

2381. Grossman, Sebastian P. (U. Chicago) **Changes in food and water intake associated with an interruption of the anterior or posterior fiber connections of the hypothalamus.** *Journal of Comparative & Physiological Psychology*, 1971(Apr), Vol. 75(1), 23-31. Studied the effects of transverse knife cuts which interrupted posterior fiber connections of the medial hypothalamus without producing significant cellular destruction in 30 female Sprague-Dawley rats. Hyperphagia and hyperdipsia resulted. Both effects were most pronounced during the 1st 2 wk. after surgery, but food as well as water intake remained significantly elevated 6 wk. after the cuts were made. Similar transverse cuts through the anterior hypothalamus, just anterior to the ventromedial nuclei, also produced hyperphagia and hyperdipsia. In most Ss these effects were transient. Average food intake returned to near-normal levels within 2 wk. and water intake declined to below-normal levels after 4 wk. 3 Ss with anterior cuts which did not appear to involve the ventromedial nuclei directly remained hyperphagic and hyperdipsic. (18 ref.)—*Journal abstract*.

2382. Thomas, Garth J. (U. Rochester, Center for Brain Research) **Maze retention by rats with hippocampal lesions and with fornixotomies.** *Journal of Comparative & Physiological Psychology*, 1971(Apr), Vol. 75(1), 41-49.—Studied 39 male hooded rats in groups with subtotal hippocampal lesions, with fornixotomies, and with sham operations. Lesioned Ss were significantly impaired in retention and in savings (errors) in relearning of a 4-unit multiple-U maze. The striking effect was that retention or savings could be well within the normal range, or memory could be severely impaired. Findings suggest that the hippocampal complex does not subserve a unique and necessary mechanism of memory. Other processes, perhaps the development of malfunctioning foci that produced abnormal function of remaining neural tissue, were necessary for the appearance of the behavioral disturbances of memory for the maze habit. (17 ref.)—*Journal abstract*.

2383. Walker, Don W., Means, Larry W., & Isaacson, Robert L. (Veterans Administration Hosp., Gainesville, Fla.) **The effects of hippocampal and cortical lesions on single-alternation go, no-go acquisition in rats.** *Psychonomic Science*, 1970(Oct), Vol. 21(1), 29-31.—Trained 4 rats with hippocampal ablations, 4 with cortical control lesions, and 4 normals on a go-no-go single-alternation task in an operant situation. Hippocampectomized Ss were facilitated, compared to normals, in acquisition in terms of latency measure (latency to 1st press on go trials/latency to 1st press on no-go trials). Cortically ablated Ss were deficient compared to normals, in terms of a response measure (total responses on no-go trials/total responses on go trials). A drive stimulus (S^D) was added to go trials after the Ss attained

a low-level criterion and was eliminated after 10 sessions. As measured by performance tests given after elimination of the S^D, no group differences were found in utilization of the S^D.—*Journal abstract*.

2386. Boakes, R. J., Bradley, P. B., Briggs, J., & Dray, A. (Medical Research Council, Neuropharmacology Unit, Birmingham, England) **Antagonism of 5-hydroxytryptamine by LSD 25 in the central nervous system: A possible neuronal basis for the actions of LSD 25.** *British Journal of Pharmacology*, 1970(Oct), Vol. 40(2), 202-218.—5-Hydroxytryptamine (5-HT), acetylcholine (ACh), noradrenaline (NA), glutamate (D,L-homocysteic acid (DHP), glycine, and γ -aminobutyric acid (GABA) were applied to single neurons in the brainstem of decerebrate cats by microiontophoresis. The abilities of LSD 25 methysergide maleate (1 ML 491), and 2-bromo-lysergic acid diethylamide (BOI 148) to antagonize the actions of these compounds were studied. LSD 25 antagonized 5-HT excitation of single neurons when applied iontophoretically or administered iv. LSD 25 also antagonized glutamate excitation of neurons which could be excited by 5-HT. Inhibitory effects of 5-HT, the action of glutamate on neurons which could be inhibited by 5-HT, and the actions of all the other compounds tested were unaffected by LSD 25. Iontophoretically applied 1 ML 491 was also a specific antagonist to 5-HT and glutamate excitation but was less potent than LSD 25. BOI 148 rarely exhibited antagonism. It is suggested that antagonism to 5-HT and glutamate excitation of brainstem neurons may be the basis of the psychotomimetic action of LSD 25. It is also suggested that there may be similarities in the mechanisms by which 5-HT and glutamate produce excitation where they act on the same neuron. (6 ref.)—*Journal abstract*.

2388. Laverie, R. & Taylor, K. M. (U. Otago Medical School, Dunedin, New Zealand) **Effects of intraventricular 2,4,5-trihydroxyphenylethylamine (6-hydroxydopamine) on rat behaviour and brain catecholamine metabolism.** *British Journal of Pharmacology*, 1970(Dec), Vol. 40(4), 836-846.—6-Hydroxydopamine (200 μ g injected intraventricularly) caused depletion of noradrenaline from all regions of rat brain within 2 hr. after injection but depletion of dopamine in the brain was observed only from 2 days after injection. Both catecholamines remained depleted for more than 32 days. Rats treated with intraventricular 6-hydroxy-

ydopamine were sedated and lethargic, with reduced spontaneous and exploratory activity, for periods of up to 8 days after injection. Conditioned avoidance responding was abolished or reduced for a similar period. Intraventricular 6-hydroxydopamine caused a prolonged reduction in the amount of labeled catecholamines in store 4 hr. following an intraventricular injection of ³H-dopamine. During the 1st 6 hr. after 6-hydroxydopamine injection, there was a marked increase in neutral and acid metabolites from the labeled catecholamines. A comparison of the behavioral and biochemical effects of intraventricular 6-hydroxydopamine and reserpine suggests that both drugs affect catecholamine storage mechanisms but by different mechanisms. It was not possible from these experiments to correlate behavioral changes with either catecholamine storage or metabolism. (15 ref.)—*Journal abstract.*

2389. Marley, E. & Stephenson, J. D. (Inst. of Psychiatry, London, England) **Effects of catecholamines infused into the brain of young chickens.** *British Journal of Pharmacology*, 1970(Dec), Vol. 40(4), 639-658.—Infused (–)-noradrenaline, (–)- α -methylnoradrenaline, and (–)-isoprenaline into various brain regions of 12-21 day chicks. When infused into the hypothalamic area, but not the cerebral hemisphere or posterior mesencephalon, these amines produced behavioral sleep, lowered temperature and blood pressure, and reduced oxygen consumption. Electrocorical sleep activity usually ensued but this was not marked and frequently dissociation between electrocorical activity and behavior occurred. After MAO inhibition, which prolonged the action of noradrenaline, dopamine had similar effects. The effects of the catecholamines were prevented or substantially reduced by pretreatment with phenoxybenzamine given iv or into the hypothalamus but not by iv injection of propranolol. However, intrahypothalamic infusion of propranolol prevented the temperature, but not the behavioral effects of noradrenaline. The fact that the effects were similar but more intense, apart from electrocorical changes, and of longer duration than those seen after iv injection of catecholamines suggests that in young chicks these amines penetrate from the blood into the brain and elicit their effects through a localized region, presumably the hypothalamus. Electrical Stimulation

2390. Altman, Jack L. & Wishart, Thomas B. (U. Western Ontario, London, Canada) **Motivated feeding behavior elicited by electrical stimulation of the septum.** *Physiology & Behavior*, 1971(Feb), Vol. 6(2), 105-109.—Electrical stimulation of the septal region of the rat brain was found to induce a poststimulation sequence of shaking, grooming, and feeding in an experiment with 5 male albino and 5 male black-hooded rats. This stimulation was capable of maintaining an operant response to obtain food in the sated S. In the deprived S, such stimulation depressed operant responding for food. 2 hypotheses, both involving seizure activity in the limbic lobe, were proposed to account for these results. (15 ref.)—*Journal abstract.*

2391. Asdourian, David & Andrezik, Joseph. (Wayne State U.) **Cerebellar stimulation is effective as a CS at low stimulation intensities in rats.** *Journal of Comparative & Physiological Psychology*, 1971(Apr), Vol. 75(1), 165-170.—Utilized stimulation of cerebellar cor-

tical areas as the CS in a 2-way avoidance task with 17 male albino Holtzman rats. The stimulation remained effective in maintaining avoidance behavior even though stimulation intensities were reduced 40-90% below forced-movement thresholds. For all but 2 Ss that learned the task, the lowest effective stimulation amperages were between 4-80 μ a., making it unlikely that (a) there was current spread to the brainstem, or (b) the signal used as the CS consisted of proprioceptive information elicited by forced movement.—*Journal abstract.*

2392. Delgado, Jose M. (Yale U., Medical School) **ESB.** *Psychology Today*, 1970(May), Vol. 3(12), 48-53.—Reviews the effects of electrical stimulation of the brain in controlling aggression, rage, fury, fear, anger, feelings of pleasure, and laughing. Whether electrical stimulation will be a tool of governments is a question which must be faced. The precedent for the official manipulation of personal biology has already been made in the field of public health. Here the results have been beneficial. The wise use of electrical stimulation could similarly lead to a better life for man.—E. J. Posavac.

2395. Fog, R., Randrup, A., & Pakkenberg, H. (St. Hans Hosp., Psychopharmacological Lab., Roskilde, Denmark) **Intrastratial injection of quaternary butyrophenones and oxypertine: Neuroleptic effect in rats.** *Psychopharmacologia*, 1971, Vol. 19(3), 224-230.—In an experiment with white Wistar male rats, it was found that bilateral intrastratial microinjections in rat brains of quaternary neuroleptic drugs of the butyrophenone type (haloperidol, benperidol, floropipamide) and the indole type (oxypertine) antagonized amphetamine-induced stereotyped behavior, with the development of catalepsy. These 2 behavioral effects were also typical for neuroleptics given subcutaneously. No effect was observed when placebo was injected intrastratially or when quaternary haloperidol was injected into the thalamus or hippocampus. The neuroleptic effect may be exerted through dopaminergic mechanisms in the corpus striatum.—*Journal abstract.*

2396. Gordon, Arthur & Baum, Morrie. (McGill U., Montreal, Quebec, Canada) **Increased efficacy of flooding (response prevention) in rats through positive intracranial stimulation.** *Journal of Comparative & Physiological Psychology*, 1971(Apr), Vol. 75(1), 68-72.—Trained 4 groups of 6 female hooded rats to avoid severe shock (1.3 ma). Subsequently, 2 groups received 5 min. of flooding (response prevention), while the other 2 spent an equal amount of time in a neutral environment. Flooding consisted of thwarting the learned avoidance response while forcing the S to remain in the feared situation. During this 5-min period, 1 flooding and 1 nonflooding group received positive intracranial stimulation. Results showed that the group receiving both flooding and stimulation extinguished more rapidly than any other group. No other differences in rate of extinction were found between any other 2 groups.—*Journal abstract.*

2397. Kogan, A. B. & Kompaneets, E. B. (Rostov State

U. USSR) **Uslovnoreflektornoe differentsirovanie mozaik vzbuzhdeniya vyzvannykh pryamym elektricheskom razdrazheniem zritel'noi kory.** [Conditioned discrimination of excitation patterns produced by direct electrical stimulation of the visual cortex.] *Doklady Akademii Nauk SSSR*, 1971, Vol. 196(1), 243-245.—In 5 chronically prepared cats the salivary reflex was conditioned to spatial patterns of simultaneous electrical stimulation of the visual cortex. In each S, within an area of $3 \times 3.4 \times 4$ mm., 3, 4, 5, or 6 electrodes were implanted in different spatial arrangements. 1 pattern of stimulation through 2 or 3 of these electrodes was reinforced with food while another pattern was not reinforced. Ss learned to discriminate between the 2 patterns. The possibility of proprioceptive conditioning arising out of the motor responses of the Ss to electrical stimulation was rejected since discrimination learning took place even when both the positive and negative patterns of stimulation aroused identical orienting motor responses in an S.—*L. Zusne.*

2398. Levine, M. S., et al. (U. Rochester) **Retrograde amnesic effects of inferotemporal and amygdaloid seizures upon conditioned suppression of lever-pressing in monkeys.** *Neuropsychologia*, 1970(Nov), Vol. 8(4), 431-442.—Seizures induced electrically in the inferotemporal cortex, as monitored by EEG recording, produced retrograde amnesic effects upon the development of conditioned suppression of lever-pressing to a visual CS paired with shock UCS but not to a similarly paired auditory CS. Ss were 8 rhesus and 16 stump-tail monkeys. The afterdischarges, which propagated to the amygdala among other structures, appeared to interfere with the association of the visual CS with the noxious UCS without blocking retention of information about the noxious UCS itself. By contrast, seizures induced in the amygdala, which showed a more variable pattern of propagation to inferotemporal cortex, produced no apparent retrograde amnesic effects. (French & German summaries) (24 ref.)—*Journal abstract.*

2399. Nieder, P. & Nieder, I. (Presbyterian U. Pennsylvania Medical Center, Philadelphia) **Antimasking effect of crossed olivocochlear bundle stimulation with loud clicks in guinea pig.** *Experimental Neurology*, 1970(Jul), Vol. 28(1), 179-188.—Investigated the finding that crossed efferent stimulation further reduces a partially masked neural response from the cochlea. A wide range of click intensities was used in testing 9 anesthetized guinea pigs with middle ear muscle attachments cut and differential electrodes placed in the basal cochlear turn. With high level click stimuli efferent stimulation significantly increased the masked neural response. The peak to peak amplitude of the gross neural response of the cochlea was plotted as a function of click level both with and without efferent stimulation with no background stimulus and also with a masking noise present. The input-output functions strongly suggest that there is a low threshold afferent fiber moiety whose response to low level signals is blocked by crossed stimulation, but which are then available for excitation by higher level signals. It is suggested that these fibers are excited by both outer and inner hair cells.—*Journal abstract.*

2400. Pellet, Jean & Dermenonville, Jean M. (U. Marseille, France) **Effets de la stimulation électrique répétitive du vermis au cours du sommeil avec activité corticale rapide.** [Effects of repetitive electrical stimulation of the vermis during sleep with fast cortical

activity.] *Physiology & Behavior*, 1971(Feb), Vol. 6(2), 175-190.—Studied the effects of high frequency electrical stimulation of the vermal cortex (culmen declivé) during paradoxical sleep (PS). The characters of the reactions registered depended essentially on the intensity of the stimulations. The average increase of the cerebellar arousal thresholds from slow to fast sleep was 62%. No significant difference between the average arousal thresholds of Lobules V and VI were noticed. The enhancement of the thresholds was maximal during the periods of PS with phasic activities. These unspecific arousal effects were subject to habituation. Liminal stimulations for the PS arousal induced a postural collapse during wakefulness. Weak unawakening vermal stimulation had transitory effects on the tonic and phasic events of PS: modifications of the hippocampal theta rhythm and suppressions of the phasic waves of the occipital cortex at central level, restorations of the muscular tonus and reductions of clonic twitches and of ocular movements at a peripheral level. The cerebellar arousal might be explained, through vermis-fastigio-reticular systems, by an early disfacilitation of the inhibitory reticular formation, followed by a late poststimulatory facilitation of the reticular activating system. The transitory effects of weak vermal stimulation might be related to a lighter sleep. A depressing and more specific action on the brainstem structures which are responsible for phasic manifestations of PS may also be invoked. (59 ref.)—*English abstract.*

2401. Pellet, Jean & Dermenonville, Jean M. (U. Marseille, France) **Effets éveillants de la stimulation électrique répétitive du vermis au cours du sommeil avec activité corticale lente.** [Arousal effects of repetitive electrical stimulation of the vermis during sleep with slow cortical activity.] *Physiology & Behavior*, 1971(Feb), Vol. 6(2), 165-174.—Studied the arousal effects of high frequency stimulation of the dorsal regions (culmen, declivé) of the vermal cortex in chronic regions (culmen, declivé) of the vermal cortex in chronic guinea pigs during slow sleep. Corticographic and behavioral arousals were easily produced. They presented some characters of reticular arousals: gradation in the manifestations of the responses parallel to the rise of the stimulation intensity, threshold varying with the depth of sleep, and habituation effects. Relations between ascending cortical actions and descending tonic-postural actions were particularly studied, i.e. an early and short cortical activation may be obtained without behavioral arousal for liminal stimulations. These unspecific responses were elicited by voltages of stimulation lower than those which induce the classical specific motor effects. It is suggested that the early phase of the arousal might be explained by a transitory cerebellar disfacilitation of the synchronizing and disactivating structures during cortical stimulation, whereas activating structures might have been caused by a late poststimulatory late cerebellar facilitation of the reticular activating system. The weak unawakening vermal stimulations during slow sleep did not trigger the fast wave sleep nor modify its organization. Several interpretations are proposed regarding the absence of fast sleep induction. (62 ref.)—*English abstract.*

2402. Pond, Fred J., Lidsky, Theodore I., Levine, Michael S., & Schwartzbaum, J. S. (U. Rochester) **Hippocampal electrical activity during hypothalamic-evoked consummatory behavior in rats.** *Psychonomic Science*, 1970(Oct), Vol. 21(1), 21-23.—Recorded hippocampal electrical activity in freely moving

Ss during normal feeding behavior, lateral-hypothalamic stimulation, and during eating and drinking induced by such stimulation. Ss were 3 male Holtzman rats that displayed stimulus-bound consummatory behavior. In contrast to the irregular and desynchronized hippocampal activity observed during normal feeding behavior, stimulus-bound eating and drinking were associated with synchronization of hippocampal activity. The peak frequency of theta rhythms during such elicited consummatory behavior was 1-2 Hz. below that evoked by the stimulation in the absence of consummatory objects. Results point up differences between normal and stimulus-evoked consummatory behavior and the influence of consummatory activity upon electrophysiological state.—*Journal abstract.*

2406. Wyers, Everett J. & Deadwyler, Samuel A. (State U. New York, Stony Brook) **Duration and nature of retrograde amnesia produced by stimulation of caudate nucleus.** *Physiology & Behavior*, 1971(Feb), Vol. 6(2), 97-103.—In an experiment with 112 male albino rats, it was found that Ss given a single brief footshock while standing upright and drinking from a water tube were slow in returning to the tube and drinking when tested 24 hr. later. When single pulse bilateral electrical stimulation of the caudate nuclei followed the footshock they were quick to return and drink. This retroactive effect of the stimulation was temporally graded. It resulted from a retrograde amnesia produced by the stimulation. A delay of 5 min. was effective. A further experiment repeating the treatment a 2nd time indicated that a 15-min delay was not effective. Another experiment repeated the treatment 4 times. Rate of learning (avoidance of the tube) increased as the delay of stimulation increased indicating that the stimulation was stopping the encoding of short-term associative learning into memory at the time of its application. (21 ref.)—*Journal abstract.*

2407. Young, A. Grant & Galluscio, E. H. (Louisiana State U.) **Effects of ECS on one-trial learning following continuous- and partial-reinforcement training.** *Psychonomic Science*, 1970(Oct), Vol. 21(1), 43-44.—Trained 32 naive male albino rats to leverpress for sucrose using a discrete trial procedure. $\frac{1}{2}$ of the Ss were trained on a CRF schedule, and the other $\frac{1}{2}$ on a fixed-ratio (FR) schedule. Following acquisition, for $\frac{1}{2}$ of the Ss in each group, a leverpress produced footshock followed by ECS. For the remaining Ss, a leverpress

produced footshock only. Results show that suppression of the leverpress response due to footshock was reduced by the ECS, regardless of the acquisition reinforcement schedule. Results also show that FR-trained Ss failed to show the PRE in extinction.—*Journal abstract.*

ELECTRICAL ACTIVITY

2408. Arutyunyan, S. A. (Orbeli Inst. of Physiology, Erevan, USSR) **Issledovanie fonovoï elektricheskoi ritmiki kory mozga i nekotorykh podkorkovykh struktur pri vyrabotke uslovykh reflektsov u koshek.** [Study of background electrical rhythm in the cortex of the brain and in several subcortical structures when elaborating conditioned reflexes in cats.] *Doklady Akademii Nauk Armyanskoi SSR*, 1969, Vol. 48(5), 307-312.—Ss were 12 adult cats with chronically implanted electrodes in the visual, auditory, motor, and associative cortical areas and in the lateral geniculate body and mesencephalic reticular formation. Background (spontaneous) electrical activity of different parts of the brain was studied as affected by the elaboration of positive and inhibitory motor-alimentary CRs to light. The data suggest that a shift in the direction of the higher frequencies is the most general electrophysiological effect of the excitatory processes in spontaneous rhythms, whereas inhibitory reactions are expressed in the EEG by a prevalence of the less frequent rhythms and by the appearance in the visual cortical areas of bursts of spindlelike activity. The electrographic similarity of the different forms of internal inhibition confirm the genetic commonality of their origin. (Armenian summary) (15 ref.)—*J. D. London.*

2409. Bessou, P., Burgess, P. R., Perl, E. R., & Taylor, C. B. (U. Utah, Medical School) **Dynamic properties of mechanoreceptors with unmyelinated (C) fibers.** *Journal of Neurophysiology*, 1971(Jan), Vol. 34(1), 116-131.—Unmyelinated (C) fibers were recorded from peripheral nerves of anesthetized cats and intracellular recordings were obtained from cell bodies of C fibers. Gentle mechanical stimulation excited these fibers, but they showed little capacity to signal rapid changes in stimulus: they were incapable of following an oscillating stimulus above 1 Hz. They were excited by brief mechanical pulses and adapted gradually to a steady stimulus. Their receptive fields were small and not excited by gentle hair movement.—*G. Westheimer.*

2410. Blankenship, James E., Wachtel, Howard, & Kandel, Eric R. (New York U., Medical School) **Ionic mechanisms of excitatory, inhibitory, and dual synaptic actions mediated by an identified interneuron in abdominal ganglion of Aplysia.** *Journal of Neurophysiology*, 1971(Jan), Vol. 34(1), 76-92.—The interneuron L10 in the abdominal ganglion of Aplysia mediated inhibitory potentials in some cells and or excitatory potential in others. Early inhibitory postsynaptic potentials produced by the cell was Cl^- dependent; the excitatory postsynaptic potentials were Na^+ dependent. The effects were also produced by iontophoretically applied acetylcholine, suggesting that the latter is the natural transmitter released by the interneuron at all its branches.—*G. Westheimer.*

Medical School) Receptive-field characteristics of superior colliculus neurons in the rabbit. *Journal of Neurophysiology*, 1971 (Jan), Vol. 34(1), 148-156.—Extracellular recording within the superior colliculus of unanesthetized paralyzed rabbits gave cells that could be classified into cells with concentric antagonistic surrounds (12%), with uniform fields (22%), movement sensitivity (23%), directional selectivity (9%), and with a hypercomplex elongated receptive field (19%).—G. Westheimer.

2416. Ong, Jin & Fisher, Mark A. (Southern Cal. of Optometry) Effect of visual size on galvanic skin response. *Proceedings of the Annual Convention of the American Psychological Association*, 1971, Vol. 64(Pt. 1), 85-86.—Investigated GSR latency, mean amplitude, and quiescent or postreading time during or after reading paragraphs of various acuity levels. The Beckman Dynograph with miniature skin electrodes was used to record GSR of 6 undergraduates. Results show that latency varies with letter size exponentially, that letter size has no effect on amplitude, and that postreading time and letter size varies negative-linearly.

2417. Pinel, John P., Malbury, Charles W., & Corcoran, Michael E. (U. British Columbia, Vancouver, Canada) The incubation effect in rats: Skin resistance changes after footshock. *Physiology & Behavior*, 1971 (Feb), Vol. 6(2), 111-114.—Measured the skin resistance of 25 naive male black hooded rats at a resistance of 25 ohms using a 500 Hz sine wave bridge apparatus for 2 min. on each of 3 consecutive days. On the 4th day a footshock (FS) was administered to 4 groups of Ss but not to a 5th control group. Skin resistance was then measured 1 min., 1 hr., 5 hr., or 24 hr. after FS. Skin resistance was found to increase over the 1 hr. after FS tests, and a decrease in skin resistance was produced by FS in those Ss tested 1 min. or 1 hr. after

FS. Findings conflict with the hypothesis that the incubation of freezing and fear is a function of time after a stressor. FS is postulated as a function of anxiety. (10 ref.)—J. J. L. L.

2418. Routhak, A. (Ed.) Dlitel'nye elektricheskie potentsialy nervnoi sistemy. I. [Electrical potentials of the nervous system. I.] *Trudy, USSR Med. Akad. Nauk*, 1970, 330 p.

2419. Ruzinov, V. S., Nivets, T. B., & Fersht, V. L. (USSR Academy of Sciences, Inst. of Higher Nervous Activity & Neurophysiology, Moscow) Dlitel'nye elektricheskie potentsialy v kore bol'shogo mozga i ikh funktsional'noe znachenie. Prolonged electrical potentials in the cerebral cortex and their functional meaning. In A. I. Routhak (Ed.), "Dlitel'nye elektricheskie potentsialy nervnoi sistemy." (See PA Vol. 46, Issue 2, 282, 1971.) Studies of the effects of the shifts of cortical potentials (CPI) by means of electrodes were accompanied with the administration of electric stimulation was applied to the following locations: (a) cerebral cortex, (b) subcortical structures, specific and nonspecific of the thalamus nuclei, and (c) reticular formation of the brain. The variables were: change of CPI and/or resulting from changing the stimulus intensity, (b) direction of shift, (c) nature of response, whether diffuse or localized, and (d) effect of pharmacological agents. The shifts of CPI during the stimulation of the cortex induced the appearance of temporary excitation and inhibition of reflexes, inhibition of the excitability of the cortex, and disappearance of the excitatory CPI. It is pointed out also that the shifts of CPI induce the change in the polarization of the neuron membrane and the facilitation of the neuron postsynaptic potentials. (11 ref.)—H. H.

2420. Shean, G. D. (Can. of Women & Men) Instrumental modification of the galvanic skin response: Conditioning or control? *Psychological Monographs*, 1971, Vol. 44, No. 1, 1-11.—To determine the effects of the GSR on the response which can be conditioned, 20 female Ss were given 15 instructions. 15 male and 13 female Ss were assigned to 2 groups. Group 1 received explicit instructions about the response-shock contingencies. Group 2 was told that shock would follow the lights on some trials. Results indicate that GSR can be both increased and decreased by explicit instrumental contingencies. However, the results do not appear to have resulted from direct instrumental conditioning of the GSR, but rather from secondary conditioning of the GSR by the shock. (10 ref.)—J. J. L. L.

2422. Stewart, Richard P. & Hill, Frances A. (Montana) Effects of instruction and interstimulus interval in human GSR conditioning.

beta) which are considered expressions of the present and past, there is a constant phenomenon of balance for each phase of central nervous activity. This alternating must be studied in the various modifications of the operative function of nervous structures as well as in prevalent moments of CNS activity, e.g., waking and sleeping. The active state of the organism is studied as a moment of supremacy of the "past" component on a level with structures of consciousness, where the supremacy of the "present" leads to a state of greater reflection and to an "inwardness." In the 2 alternating moments the component which is not prevalent passes in the former case to axial structures and in the latter case to subcortical circuits. (English summary)—*A. M. Farfaglia*.

BIOCHEMISTRY

2436. Efron, Daniel H., Harris, S. Richard; Manian, Albert A., & Gaudette, Leo E. (National Inst. of Mental Health, Chevy Chase, Md.) **Radioassay of chlorpromazine and its metabolites in plasma.** *Psychopharmacologia*, 1971, Vol. 19(3), 207-223.—Conditions have been established for the quantitative formation of radio-labeled derivatives of chlorpromazine, chlorpromazine sulfoxide, and their demethylated analogs in plasma extracts. Tritiated N-acetyl derivatives are formed from the demethylated compounds and C¹⁴ quaternary amines from the tertiary amines by acetylation and methylation, respectively. These reactions are quantitative over a wide range of concentrations. The reactions may be performed sequentially when chlorpromazine and its Nor derivatives (or chlorpromazine sulfoxide and its Nor derivatives) exist in a single extract. An extraction procedure has been suggested by which chlorpromazine and its Nors may be separated from chlorpromazine sulfoxide and its Nor derivatives so that each fraction may be subjected to the sequential acetylation and methylation reactions. Recoveries of µg quantities of standards from plasma are less than quantitative, probably because of losses due to glass absorption and protein binding, but may be corrected with appropriate internal standards. As low as 15-20 ng/ml of each compound are measurable in a 3-ml plasma aliquot. The method has been applied to a limited number in vivo experiments in dogs and humans.—*Journal abstract*.

2437. Hafeez, Mohammad A. (U. California, Berkeley) **Studies on the pineal organ in teleost fishes.** *Dissertation Abstracts International*, 1971 (Jan), Vol. 31(7-B), 4396.

2438. Sharma, V. N., Mital, R. L., Banerjee, S. P., & Sharma, H. L. (S.M.S. Medical Coll., Japur, India) **Pharmacological studies with some newly synthesized phenothiazines exhibiting lesser extrapyramidal reactions.** *Japanese Journal of Pharmacology*, 1969 (Jun), Vol. 19(2), 211-223.—Discusses control of 1969 (Jun), Vol. 19(2), 211-223.—Discusses control of extrapyramidal side effects of the phenothiazines. A review of the literature, regarding the biochemical alterations produced by drug induced parkinsonism, indicates that the only way to reduce the parkinsonism liability of these drugs is to increase their anticholinergic-like activity. Since oximes are generally used as antidotes in case of organophosphorous poisoning, it is suggested that anticholinergic compounds of these types can provide a tranquilizer with less liability for Parkinson's disease. In the present study quaternary oximes of phenothiazine drugs were synthesized and assessed for their parkinsonism liability. Their CNS depressant properties were also studied and compared with their parent drugs. Data indicate that it is possible to decrease the parkinsonism liability to a greater extent, with only a little loss of antipsychotic activity. A positive correlation between these 2 biological actions probably does not exist. (28 ref.)—*Journal summary*.

2439. Wachtel, Howard & Kandel, Eric R. (New York U., Medical School) **Conversion of synaptic excitation to inhibition at a dual chemical synapse.** *Journal of Neurophysiology*, 1971(Jan), Vol. 34(1), 56-68.—The interneuron L10 in the abdominal ganglion of *Aplysia* mediated sequential chemical excitation and inhibition in the Cell L7. The presynaptic neuron produced excitatory postsynaptic potentials in the follower cell at low firing rates, but inhibitory postsynaptic potentials at higher firing rates. The transmitter, acetylcholine, excited 2 separate postsynaptic receptors: an excitatory one which has a low acetylcholine threshold and an inhibitory one with a higher threshold. As a result of these properties, this synaptic connection was extraordinarily sensitive to changes in firing patterns of the presynaptic neuron.—G. Westheimer.

Hormones

2440. Booth, D. A. & Pain, J. F. (U. Sussex, Brighton, England) **Effects of a single insulin injection on approaches to food and on the temporal pattern of feeding.** *Psychonomic Science*, 1970(Oct), Vol. 21(1), 17-19.—24 naive male albino rats raised a panel in approaching food more often after their 1st insulin injection than after a control injection. At the same time there was a reduced incidence of long pauses in feeding under the influence of injected insulin. Also, the size of the 1st feeding bout after injection and its ratio to the delay before the next feeding bout both increased. This suggests that insulin elicits hunger by attenuating satiety signals.—*Journal abstract.*

2441. Coville, P. F. & Telford, J. M. (BDH Research, Ltd., Godalming, England) **The effect of thyroid hormones on the action of some centrally acting drugs.** *British Journal of Pharmacology*, 1970(Dec), Vol. 40(4), 747-758.—Determined the effect of administration of thyroxine or thyroidectomy on the pharmacological action of (+)-amphetamine, (benzedrine, direct stimulant), caffeine, hexobarbitone, and morphine in rats or mice. Locomotor activity induced by (+)-amphetamine caffeine was increased by hyperthyroidism and decreased by hypothyroidism. The LD50s of (+)-amphetamine and caffeine in hyperthyroid rats were $1/3$ and $2/3$ that of control rats. With each drug, the LD50 regression lines in hyperthyroid and control rats were not parallel, suggesting that hyperthyroidism modifies the mechanism of the toxic effects. Hypothyroidism reduced toxicity to (+)-amphetamine. The effects of the drugs on the sleeping time in the Ss and controls are discussed. In contrast to rats, a sex difference in the duration of action of hexobarbitone was not found in mice. Thyroxine prolonged sleeping time equally in each sex. Analgesia induced by morphine in mice was unaffected by hyperthyroidism. No increase in sedative or "Straub tail" activity could be detected, but toxicity was increased when higher doses of morphine were used. The mechanism by which thyroid hormones produce these changes in sensitivity to centrally acting drugs is discussed. It is suggested that the effects of thyroxine vary according to whether the mode of action of the drug or its metabolism is modified. (21 ref.)—*Journal abstract.*

2442. Eaton, Gordon G. (U. California, Berkeley) **Perinatal androgen's role in the ontogenesis of coital behavior in the male hamster (*Mesocricetus auratus*).** *Dissertation Abstracts International*, 1971(Jan), Vol. 31(7-B), 4359.

2443. Pappas, Bruce A. & Gray, Peter. (Rockefeller

U.) **Cue value of dexamethasone for fear-motivated behavior.** *Physiology & Behavior*, 1971(Feb), Vol. 6(2), 127-130. In Exp. I, with 22 naive albino Charles River rats, Ss deprived of water for 24 hr. were administered a single grid shock after emitting 200 licks. Latencies to resume licking were significantly increased by prior ACTH injection but were unaffected by injections of dexamethasone, which inhibits endogenous ACTH, or by corticosterone. In Exp. II, with 40 naive male albino Charles River rats, water-deprived Ss were injected with either dexamethasone or saline, and given 5 shocks in the licking chamber. 24 hr. later they were tested for lick latencies under the same or different injection treatment. Ss shocked and tested under dexamethasone showed equivalent latencies to those shocked and tested under saline injection. However, Ss trained and tested under opposite injection conditions showed significantly shorter latencies than Ss trained and tested under the same drug condition, indicating that the dexamethasone had functioned as a cue.—*Journal abstract.*

2444. Sassin, J. F., et al. (U.S. Navy Medical Neuropsychiatric Research Unit, San Diego, Calif.) **Human growth hormone release: Relation to slow-wave sleep and sleep-waking cycles.** *Science*, 1969(Aug), Vol. 165(3892), 513-515.—Ss were 10-28 yr. old healthy, adult, male volunteers. Ss were allowed normal meals and activity when not under study, but were kept fasting and at rest during experimental sessions. Release of human growth hormone during sleep was significantly related to slow, synchronized stages of sleep and therefore would seem to be controlled by related neural mechanisms. When sleep-waking cycles were reversed by 12 hr., the release of growth hormone with sleep was reversed; this release did not follow an inherent circadian rhythm independent of sleep.—*Journal abstract.*

Drug Effects—Human

2445. Agnew, Neil M. & Ernest, Carole H. (York U., Toronto, Ontario, Canada) **Dose-response and biased set study of an amphetamine and a barbiturate.** *Psychopharmacologia*, 1971, Vol. 19(3), 282-296.—Compared 3 dosage levels of barbiturate and 3 of amphetamine with a placebo, all under 3 set conditions (neutral, stimulant, and sedative). Drug reactions in 315 undergraduates were assessed by performance measures and by self-rating scales administered at a series of standard times following the drug administration to provide drug-time-response patterns. The self-rating scales yielded clear dosage-time-response curves for both drugs at all dosage levels. There was no systematic evidence of set or drug-by-set-effects. Research strategies in human drug studies are discussed. (27 ref.)—*Journal abstract.*

2446. Sidell, Frederick R. & Pless, John E. (Medical Research Lab., Edgewood Arsenal, Md.) **Ethyl alcohol: Blood levels and performance decrements after oral administration to man.** *Psychopharmacologia*, 1971, Vol. 19(3), 246-261. 26 healthy young male enlisted men drank ethyl alcohol (diluted in orange juice) in doses ranging from .5-2 ml/kg (.4-1.6 gm/kg). Levels of performance on 3 measures correlated well with dose and blood alcohol levels and decline of effects paralleled the fall in blood levels. The greatest decrement in performance was on the test requiring hand-eye coordination; lesser decrements were produced on tests of cognitive ability. (22 ref.)—*Journal abstract.*

2447. Tart, Charles T. (U. California, Davis) **Marijuana intoxication: Common experiences.** *Nature*, 1970(May), Vol. 226(5247), 701-704.—Presents the results of a questionnaire distributed to marihuana users and designed to assess the subjective characteristics of a marihuana "high" under natural (nonexperimental) conditions. Sensations (visual, auditory, tactual, gustatory, and olfactory) were typically reported to be enhanced and clarified with marihuana intoxication, although memory was reported impaired. Marihuana users reported feeling more empathetic, sociable, uninhibited, and insightful when "high." Nearly all the commonly reported effects seemed to share the characteristic of being "either emotionally pleasing or cognitively interesting...."—S. Appelle.

2448. Thomas, Timothy R. & Hull, John H. (Alma Coll.) **Effect of an anesthetic placebo on two-point thresholds.** *Perceptual & Motor Skills*, 1971(Feb), Vol. 32(1), 235-238.—2-point thresholds were measured on the forearms of 14 undergraduates. Threshold measures after the application of Vaseline were significantly lower than those taken after the application of an anesthetic placebo. The magnitude of the differences between thresholds for each S was not related to S's verbalized belief in the effectiveness of this placebo nor to the magnitude of GSR reactivity.—*Journal abstract.*

2449. Vergani, E., Ravizza, L., & Gala, S. (U. Turin, Inst. of Clinical Psychiatry, Italy) **Richerche sul comportamento nell'uomo del tasso di serotonina nelle piastre e dell'acido 5-idrossi-indolilacetico nelle urine per azione di alcuni psicofarmaci.** [Research on human behavior in the analysis of serotonin in platelets of 5-hydroxytryptamine in the urine after action of certain psychotropic drugs.] *Neuropsychiatria*, 1968(Oct), Vol. 24(4), 843-858. In 6 Ss urinary secretion of 5-hydroxyindolylacetic acid was also assessed in addition to platelet 5-hydroxytryptamine levels. The results are discussed and compared with those reported in the literature. (French, English, & German summaries) (26 ref.)—L. L'Abate.

Drug Effects—Animal

2450. Ahtee, Liisa & Shillito, Elizabeth. (Inst. of Animal Physiology, Cambridge, England) **The effect of benzodiazepines and atropine on exploratory behaviour and motor activity of mice.** *British Journal of Pharmacology*, 1970(Oct), Vol. 40(2), 361-371. Observed male albino mice in red light on a tunnel board in test exploration. Their motor activity was assessed in an open cage, 30 min. after ip injection of drugs. Atropine and methylatropine 5 or 10 mg/kg did not alter the motor activity of the mice, while chlordiazepoxide (librium, minor tranquilizer) 25 or 50 mg/kg and diazepam 10 or 20 mg/kg increased the activity. Especially at the lower of the 2 doses used. All the compounds used except methylatropine adversely affected exploratory behavior. When atropine 10 mg/kg mice was reduced and exploratory behavior was further impaired. Methylatropine did not have this effect.—*Journal abstract.*

2451. Barnett, A., Malick, J. B., & Taber, R. I. (Schering Corp., Bloomfield, N.J.) **Effects of antihistamines on isolation-induced fighting in mice.** *Psychopharmacologia*, 1971, Vol. 19(4), 359-365. A series of antihistamines representing many structural

types and pharmacological spectra antagonized isolation-induced fighting in CF No. 1-S male mice. Antagonism of fighting by these compounds was correlated with anticholinergic potency as measured by prevention of physostigmine-induced lethality but did not correlate with antihistaminic or antitetrabenazine potency. Antagonism of fighting was not related to effects of these drugs on spontaneous motor activity.—*Journal abstract.*

2452. Biederman, G. B. (U. Toronto, Ontario, Canada) **Memory enhancement of a partly-learned discrimination in pigeons by intramuscular injection of physostigmine.** *Psychonomic Science*, 1970(Oct), Vol. 21(1), 33-35.—48 male Carneaux pigeons, individually trained in 2 discrimination tasks, with 1 well learned and 1 partly learned, showed improvement in relearning each task following injection of the anticholinesterase physostigmine. A control group, receiving saline after 28 days had elapsed from the original training, showed forgetting of the partly learned discrimination. The 28-day physostigmine group showed improvement in the relearning of the partly learned discrimination. These facts suggest that anticholinesterase injection had facilitated the memory of the partly learned task in the experimental group. The failure of anticholinesterase to produce amnesia, while apparently facilitating memory for a partly forgotten discrimination, suggests that pigeon memory may operate in a different temporal sequence than does rat memory.—*Journal abstract.*

2453. Borgen, Lowell A., Khalsa, J. H., King, William T., & Davis, W. Marvin. (U. Mississippi School of Pharmacy) **Strain differences in morphine-withdrawal-induced aggression in rats.** *Psychonomic Science*, 1970(Oct), Vol. 21(1), 35-36.—36 male rats (housed 6/eage) of 3 strains—Sprague-Dawley, Wistar, and Long-Evans—were given ip injections of morphine sulfate in dosages increasing over a 15 day period to a terminal dose of 405 mg/kg/day. Groups of 6 from each strain received saline control injections. Approximately 50 hr. after the last injection, significant increases in fighting behavior were observed in the Long-Evans and Wistar strains, the Long-Evans Ss showing the most aggression. Fighting continued for about 40 hr. and then subsided to control levels. Sprague-Dawley Ss receiving morphine showed no significant increase in aggressiveness over placebo-injected Ss.—*Journal abstract.*

2454. Cicero, T. J., Snider, S. R., Perez, V. J., & Swanson, L. W. (Washington U. Medical School) **Physical dependence on and tolerance to alcohol in the rat.** *Physiology & Behavior*, 1971(Feb), Vol. 6(2), 191-198. Maintained 24 Holtzman rats on ad lib food and either a forced-intake regimen of 7% alcohol (v/v) or tap water only from weaning (21 days) until 154 days of age. Upon withdrawal of alcohol most of the alcohol Ss were extremely hyperactive and appeared to be engaged in frantic, highly disorganized, exploratory behavior in an open field. The behavior of the water Ss was in marked contrast to these data. Alcohol Ss were also much less responsive to an injected dose of alcohol than water Ss, even though there was no difference in the rate of disappearance of alcohol from the blood. Data suggest a development of a cellular tolerance to alcohol after a chronic exposure period. The intake of alcohol which appeared to exceed the Ss' ability to metabolize it, increased progressively throughout the initial exposure and remained unchanged when water or even a 3rd choice (saccharin) was simultaneously offered. Data would thus seem to suggest that a model for alcohol

addiction is possible in the rat which satisfies, for the 1st time, the classical pharmacologic criteria of addiction, i.e., physical dependence, tolerance, etc. (32 ref.)—*Journal abstract.*

2455 Gage, Michael I. (U. Rochester) **Amphetamine and pentobarbital effects on interresponse time distributions of monkeys reinforced for low sequential variability of interresponse time.** *Dissertation Abstracts International*, 1971(Jan), Vol. 31(7-B), 4361.

2456. Guaitani, A., Marcucci, F., & Garattini, S. (Mario Negri Pharmacological Research Inst., Milano, Italy) **Increased aggression and toxicity in grouped male mice treated with tranquilizing benzodiazepines.** *Psychopharmacologia*, 1971, Vol. 19(3), 241-245. Fed N-demethyl diazepam, diazepam, and oxazepam, incorporated in the diet, to albino Swiss male and female mice (10-50 mg/day/kg of body weight) for 6 mo. Increased mortality was observed in grouped male Ss, but not in female or isolated male Ss. Multiple skin lesions and necroses found in grouped male Ss were probably due to increased aggression.—*Journal abstract.*

2457 Hoyland, Valerie J., Shillito, Elizabeth E., & Vogt, Marthe. (Inst. of Animal Physiology, Cambridge, England) **The effect of parachlorophenylalanine on the behaviour of cats.** *British Journal of Pharmacology*, 1970(Dec), Vol. 40(4), 659-667.—Male and female kittens and adult cats in 4 groups of 6 Ss each were given p-chlorophenylalanine orally. After treatment, some of the male Ss showed mounting behavior and the kittens and nonestrous females showed an increase in treading and rubbing which was similar to 1 aspect of preestrous behavior. The treated Ss also appeared to suffer from skin irritation and showed increased restlessness which accompanied sleep deprivation. Injection of 5-hydroxytryptophan stopped abnormal sexual activity and restored normal sleep for about 5 hr. It is concluded that 5-hydroxytryptamine-containing neurons inhibit sexual behavior in cats and that this role can be seen in males and, to some extent, in female Ss. (15 ref.)—*Journal abstract.*

2458. Hutchings, Donald E. & Gibbon, John. (New York State Psychiatric Inst., New York) **The effects of vitamin A excess administered in late pregnancy on discrimination learning.** *Proceedings of the Annual Convention of the American Psychological Association*, 1971, Vol. 6(Pt. 1), 211-212.—Maternal vitamin A excess is a teratogenic treatment known to interfere with the histogenesis of the fetal rat CNS. This treatment was administered on Days 14 and 15 of gestation to determine possible behavioral effects in the offspring. Treated Ss learned an operant auditory discrimination more slowly and performed it less efficiently than controls. Because the treated Ss attained a performance level comparable to the controls when an aversive component was added to the schedule, an auditory or intellectual deficit was ruled out. An impairment in attention or motivation was suggested as mediating the treated Ss' poor discrimination performance.—*Author abstract.*

2459. Isaac, Walter. (U. Georgia) **A study of the relationship between the visual system and the effect of d-amphetamine.** *Physiology & Behaviour*, 1971(Feb), Vol. 6(2), 157-159.—In an experiment with 32 male albino rats, it was found that the observed stimulant effect of d-amphetamine as measured by cage activity in the nocturnal animal was at least partially due to the drugs reducing the activity suppressing effect of

illumination. The drug had its greatest effect in combination with a lesion of the superior colliculus.—*Journal abstract.*

2460. Iwahara, Shinkuro & Matsushita, Kazuyo. (Tokyo U. of Education, Japan) **Effects of drug-state changes upon black-white discrimination learning in rats.** *Psychopharmacologia*, 1971, Vol. 19(4), 347-358.—Trained 24 naive male Wistar-Kimichi rats on a black-white discrimination task, using electric shock. After reaching a criterion of 18 out of 20 correct responses in the original discrimination learning (L1), the same discrimination learning was repeated twice (L2 and L3) to the same criterion. Ss were exposed to either a drug-induced state—20 mg/kg chlordiazepoxide (CDP)—or an undrugged state (saline) at each stage of discrimination learning. CDP was generally found to retard the discrimination learning both in terms of correct responses and of running times, although the latter effect was more immediate. A shift in drug state produced a decrease in the percentage of correct responses and this effect was quantitatively about the same whether responses had been overlearned (L3) or not (L2). The same dissociative effect was not found in L3 for those Ss who had previously been trained in both drug states. Contrary to previous studies, running times were not state dependent.—*Journal abstract.*

2461. Kusé, Yoshitoshi, Miyata, Takeshi; Kamikawa, Yuichiro, & Kataoka, Mikiko. (Kamamoto U., Faculty of Pharmaceutical Sciences, Mikiko, Japan) **Pharmacological studies on alicyclic amines: II. Central actions of piperidine, pyrrolidine and piperazine.** *Japanese Journal of Pharmacology*, 1969(Jun), Vol. 19(2), 300-314.—All 3 amines (a) showed notable CNS actions, (b) significantly prolonged hexobarbital sleeping time in mice, (c) effectively blocked the conditioned avoidance response in rats, and (d) did not show significant inhibitory effects on both maximal electrical seizure and pentylenetetrazol. Piperidine and pyrrolidine (a) produced sedation when administered iv to mice in very small doses, (b) showed depressing effects on aggressive behavior in rats and mice, (c) when administered ip, potentiated the tremor following administration of tremorine and produced eventual death; and (d) when administered intraventricularly during pretreatment, prevented appearance of tremor by tremorine, but treatment after the tremor caused potentiation. The significance of central actions of the 3 amines is discussed. It is concluded that piperidine and pyrrolidine show notable central actions similar to those of nicotine and acetylcholine, and that piperazine shows predominant depressing actions on the CNS. (43 ref.)—*Journal summary.*

2462. Kilbey, M. Marlyne & Harris, Robert T. (Texas Research Inst. of Mental Sciences, Houston) **Behavioral, biochemical and maturation effects on early DL-para-chlorophenylalanine treatment.** *Psychopharmacologia*, 1971, Vol. 19(4), 334-346.—Administered DL-para-chlorophenylalanine to albino rats daily from within 8 hr of birth for various lengths of time during the 30-day postnatal cortical development period. In Exp. 1, with 240 F1 Wistar-Kimichi Ss, whole brain serotonin and plasma phenylalanine were measured 24 and 72 hr. posttreatment in 7-, 14-, 21-, and 28-day rats. Data support the hypothesis that DL-para-chlorophenylalanine may be used to institute the biochemical characteristics of phenylketonuria. The DL-para-chlorophenylalanine-treated Ss weighed significant-

ly less at 14 days of age and thereafter and, also, were less strong. 100 mg/kg DL-para-chlorophenylalanine was administered daily from birth through Day 30 for experimental Ss in Exp. II and III. In Exp. II, with 101 F344/I Mai Ss, maturation indices were reported to be retarded in drug-treated Ss for behaviors involving the skeletal-muscular system, and activity measures were reported to be lower at 25, 45, and 121 days of age. Exp. III, with 24 male Ss from Exp. II, showed that acquisition of a conditioned pole climb avoidance and/or escape response measured at 180 days of age was poor in early drug-treated Ss. Data indicate that early DL-para-chlorophenylalanine-treated Ss show some degree of behavioral deficit at maturity. (27 ref.)

2463. Komissarov, I. V., Makarova, L. E., & Rudenko, N. Z. (Gorki Medical Inst., Donetsk, USSR) **Mest-anestezirovushchaya aktivnost' elektronodonnogo svoystva molekul anestetikov.** [Tropical anesthetizing activity and the electron-donating properties of anesthetic molecules.] *Farmakologiya i Toksikologiya*, 1970 (Nov), Vol. 33(6), 681-683. —Anesthetine, novocaine, benecaine, xycaine, dicaine, and sovaine were shown to interact intermolecularly with benzoic acid and glycerophosphate in guinea pigs. The greater the electron-donating properties of the anesthetic molecules, the greater was the intensity of the interaction. The anesthetizing activity of the agents correlated satisfactorily with the intensity of the intermolecular interaction of the anesthetics with carboxyl and phosphorus groups. (English summary)—I. D. London.

2464. Kumar, Ramesh. (University Coll., London, England) **Extinction of fear: II. Effects of chlordiazepoxide and chlorpromazine on fear and exploratory behaviour in rats.** *Psychopharmacologia*, 1971, Vol. 19(3), 297-312. —In an experiment with 96 naive female hooded rats, it was found that Ss avoided a distinctive environment in which they had previously received inescapable electric shocks; the amounts of passive avoidance were taken as indices of the levels of conditioned fear on repeated unpunished tests. Chlordiazepoxide, 7.5 and 15 mg/kg tended to reduce fear, but did not accelerate its extinction; 30 mg/kg however, retarded the extinction of fear by making Ss inactive and thus reducing the number of unpunished entries into the fear-evoking environment. The effects of chlordiazepoxide on locomotor activity were complex; entries were increased by all 3 doses of chlordiazepoxide on the 1st trial only, and following this, activity was markedly depressed by 30 mg/kg. Chlorpromazine, however, consistently reduced locomotor activity and while it increased avoidance, possibly by augmenting fear. As a result of this increased avoidance, the extinction of fear tended to be retarded by 1.5 mg/kg of chlorpromazine. The slowing of the free extinction of fear by both of these drugs was critically dependent on the doses used, but in no case was there a beneficial effect, indicating hastened extinction of fear. (44 ref.)—*Journal abstract.*

2465. Liesiene, V. A. (Medical Inst., Kaunas, USSR) **Sravnienie faz estestvennogo sna s deistviem fenamina i aminazina i otsenka srednei chastoty ekzrema EKOg koshki.** [Comparison of the phases of natural sleep with the action of phenamine and aminazine, and evaluation of the mean frequency of ECoG extrema in the cat.] *Farmakologiya i Toksikologiya*, 1970 (Nov), Vol. 33(6), 665-669. —10 cats with implanted electrodes were used to procure a quantitative

evaluation of cortical activity in the phases of natural sleep and in the corresponding ones under the action of phenamine and aminazine (chlorpromazine). Indices employed were mean extremal frequency and mean amplitude of the electrocorticogram (ECoG). However, after im injection of 15 mg/kg aminazine, ECoG of the visual cortical area did not differ from the phases of "slow" sleep with respect to both visual inspection and mean amplitude. At the same time mean extremal frequency was lower than the level of mean extremal frequency of "slow" sleep ECoG desynchronization, produced by im administration of 5 mg/kg phenamine, was accompanied by an increase in the mean extremal frequency of the ECoG of the same cortical area to the level observed during "rapid" sleep. In both cases visual differences in the ECoG and differences in the mean amplitude were not observed. (English summary) (21 ref.)—I. D. London.

2466. Mahju, M. A. & Maickel, R. P. (Nishtar Medical Coll., Multan, Pakistan) **Accumulation of phenothiazine tranquilizers in rat brain and plasma after repeated dosage.** *Biochemical Pharmacology*, 1969 (Dec), Vol. 18(12), 2701-2710. After a single ip dose to rats, chlorpromazine, fluphenazine, promazine, trifluorpromazine, and trimetopazine achieve brain/plasma ratios > 1 , with $1/2$ -lives in brain and plasma of < 10 hr. After 5 doses at 12-hr intervals, brain/plasma ratios of all compounds, except trifluorpromazine, are greater than after a single dose, due to accumulation in the brain. Trifluorpromazine appears to reach a maximum limit in the brain at about 11-12 $\mu\text{g/g}$. The $1/2$ -lives of promazine and trimetopazine in brain and plasma are greater after 5 doses than after a single dose, while those of chlorpromazine, fluphenazine, and trifluorpromazine are essentially the same after 1 or 5 doses. (21 ref.)—*Journal abstract.*

2467. Makarov, V. A. (1st Inst. of Medicine, Moscow, USSR) **Osobennosti vliyaniya aminazina na vyzvanuyu s mindalevidnogo kompleksa sudorozhnuyu elektricheskuyu aktivnost'.** [Specificities of the influence of aminazine on convulsion potentials evoked from the amygdala.] *Doklady Akademii Nauk SSSR*, 1970, Vol. 195(6), 1472-1475. In paralyzed but unanesthetized cats epileptic discharges were produced through electrical stimulation of the basal and lateral nuclei of the amygdala. EEG recordings were made from the amygdala, the cerebral hemispheres, reticular formation, the thalamus, hypothalamus, and the hippocampus. With the lowest stimulating voltages, convulsive discharges were first observed in the reticular formation. With increasing voltage, response spread to other subcortical structures, and only then to the cortex. Aminazine (chlorpromazine) affected both the nature and duration of the convulsive discharges. It decreased the intensity of ongoing convulsive discharges and, if the amygdala was stimulated 15-20 min after the administration of aminazine, such stimulation no longer evoked convulsive potentials. The existing evidence suggests that aminazine acts by blocking the adrenergic substrate of the reticular formation.—L. Zusne.

2468. Markin, V. A. & Mitrofanov, V. S. (Inst. of Pharmacology, Moscow, USSR) **Gistokhimicheskie dannye o vliyani i tvorazizina na aktivnost' nekotorykh flavinovykh dehidrogenaz v golovnom mozge krysa.** [Histochemical data on the influence of fluoracizine on the activity of several flavine dehydrogenases in the rat brain.] *Byulleten' Eksperimental'noi*

Biologii i Meditsiny, 1971(Jan), Vol. 71(1), 43-45.—200 white rats were used in a histochemical study of the influence of fluoracizine [10-(β -diethylaminopropionyl)-2 trifluormethyl phenothiazine hydrochloride] on the activity and distribution of a number of flavine dehydrogenases in the structures of the brain. Fluoracizine has been shown to be markedly antidepressive and able to abolish extrapyramidal disorders arising from neuroleptic treatment. A single injection of fluoracizine produced a moderate or weak reduction of enzymatic activity in many cerebral structures. At the same time in the chronic experiment a distinct activation of the flavine dehydrogenases under study took place in several regions of the cortex and subcortical structures. (English summary)—*I. D. London*.

2469. Masur, Jandira; Märtz, Regina M., & Carlini, E. A. (Santa Casa U., Faculty of Medical Sciences, São Paulo, Brazil) **Effects of acute and chronic administration of cannabis sativa and (Δ^9 -trans-tetrahydrocannabinol on the behavior of rats in an open field arena.** *Psychopharmacologica*, 1971, Vol. 19(4), 388-397.—Studied the effects of acute and chronic administration of (Δ^9 -trans-tetrahydrocannabinol (Δ^9 -THC), cannabis extract, and control solution on the behavior of 117 male and female Wistar rats repeatedly exposed to an open-field arena. After the 1st dose both Δ^9 -THC and cannabis extract significantly decreased defecation, grooming, and rearing; ambulation was not affected. After 20 injections of both marihuana compounds, Ss showed values for defecation, grooming, and rearing near to those obtained during the predrug phase; control Ss, however, showed a significant decrease in these parameters indicating habituation to the open-field. Results are discussed in terms of effects of marihuana on emotional behavior of rats. (30 ref.)—*Journal abstract*.

2470. Matveev, V. F. (Moscow Medical Stomatological Inst., USSR) **Obratimost' izmenenii v golovnom mozge krys, vyzvaemykh dlitel'nym vvedeniem lizergamida (LSD).** [Reversibility of changes in the rat brain, brought on by prolonged administration of lysergamide (LSD).] *Byulleten' Eksperimental'noi Biologii i Meditsiny*, 1971(Jan), Vol. 71(1), 45-48.—100 3-mo-old white rats were given daily im injections of LSD for a 4-wk period, at the end of which Ss were sacrificed every wk. for 1 mo. Pathomorphological changes, resembling those seen at the end of the period, were retained for about 2 wk. Reversibility of the changes was noted only at the end of the 3rd wk. in the form of increased nucleolar activity and an increased number of Nissl bodies. Binuclear cells were observed at the end of the 2nd and 3rd wk. of the restorative period in the deep cortical layers. Normal reactions to RNA and DNA were restored. The dendritic apparatus remained altered for a long time. The presence of foci of disintegration and of rarefaction in the 3rd-5th cortical layers, thalamus, and hypothalamus and the tendency of the vascular walls and soft cerebral membranes to fibrosis should be viewed as the residual effects of cerebral lesion, brought on by prolonged LSD intoxication and leading to a definite disturbance of normal activity of the brain. (English summary)—*I. D. London*.

2471. McCullough, Deborah O., Milberg, Jane N., & Robinson, S. M. (U. S. Army Research Inst. of Environmental Medicine, Biochemistry & Pharmacology Lab., Natick, Mass.) **A central site for the hypothermic effects of (+)-amphetamine sulphate and**

π -hydroxyamphetamine hydrobromide in mice. *British Journal of Pharmacology*, 1970(Oct), Vol. 40(2), 219-226.—Examined unanesthetized mice, weighing 20-30 gm., for the effect of (+)-amphetamine sulphate and π -hydroxyamphetamine hydrobromide on rectal temperature. The drugs were injected ip or into the cerebral ventricles. Amphetamine produced hypothermia when injected ip in doses of 1-5 mg/kg and intraventricularly in doses of .5-25 μ g. Injections of larger doses—10 mg/kg ip and 400 μ g intraventricularly—resulted in hyperthermia followed by hypothermia. Hydroxyamphetamine produced hypothermia only when given by the intraventricular route; the effect was obtained with .5-25 μ g. An intraventricular injection of 200 μ g resulted in hyperthermia followed by hypothermia. When injected ip the sole effect on temperature was hyperthermia, and this response was obtained with 5 and 10 mg/kg. Hydroxyamphetamine injected ip or intraventricularly in doses which produced hyperthermia reduced the noradrenaline but not the dopamine content of the brain. When injected intraventricularly in smaller doses which produced hypothermia no reduction in the noradrenaline content of the brain was obtained. The hypothermia is attributed to an action on the anterior hypothalamus, and the possibility is discussed that it is brought about indirectly by the release of noradrenaline. The hyperthermia, however, is probably a peripheral effect. (21 ref.)—*Journal abstract*.

2474. Nikiforova, T. L. (2nd Moscow Medical Inst., USSR) **Vliyanie ionola (2,6-di-*tert*-butil-4-metilfenol) na prodolzhitel'nost' zhizni Drosophila melanogaster.** [Influence of ionol (2,6-di-*tert*-butyl-4-methylphenol) on duration of life of *Drosophila melanogaster*.] *Byulleten' Eksperimental'noi Biologii i Meditsiny*, 1971(Jan), Vol. 71(1), 81-82.—Ionol decreased the average life-span of fruit flies. The decrease was greater in males than in females. The action of ionol was found to intensify with increase of dosage. Results were in contrast to D. J. Harman's findings on the duration of life for mice given ionol, where the preparation was found to increase life-span. In any case, it can be seen that free radicals, neutralizable by ionol, play a decisive role in the aging process.—*I. D. London*.

2475. O'Keefe, Ruth; Sharman, D. F., & Vogt, Marthe. (Medical Research Council, Neuropsychiatry Unit, Carshalton, England) **Effect of drugs used in psychoses on cerebral dopamine metabolism.** *British Journal of Pharmacology*, 1970(Feb), Vol. 38(2), 287-304.—Chlorpromazine (thorazine, minor tranquilizer) 15 mg/kg, given daily to cats for 2 wk., produced a rise in homovanillic acid (HVA) content of the caudate nucleus, whereas the same dose of thioridazine (mellaril, major tranquilizer) lacked this effect. Of these 2 drugs only chlorpromazine causes a high incidence of drug-induced parkinsonism in man. In the mouse, chlorpromazine, thioridazine, and haloperidol increased striatal concentrations of HVA and accelerated the disappearance of dopamine (DA) after inhibition of

catecholamine synthesis with α -methyltyrosine. Oxyperine, another drug apt to produce parkinsonism in man, caused a severe reduction in striatal DA and hypothalamic noradrenaline (NA). Though all the drugs used caused temporary motor disabilities in animals, these bore no resemblance to human parkinsonism, even when treatment was continued for 7 wk or more as it was in cats and monkeys. Even at the high dose of 50 mg/kg, phenoxybenzamine did not increase DA turnover in mouse brain, but it sedated the mice as did the tranquilizers. Atropine sulphate, 25 mg/kg, reduced the HVA content of mouse striatum and partially antagonized the rise in HVA produced by phenothiazines. The effect was surmountable. Possible modes of action of atropine are discussed. 2 types of biochemical changes which may occur in the brain of animals after treatment with drugs apt to cause parkinsonism in man are known: (a) a loss of cerebral catecholamines, as seen after reserpine or oxyperine; or (b) an increase in turnover of DA as after phenothiazines and butyrophenones. (29 ref.)—*Journal abstract*.

2476. Orsingher, Otto A. & Fulginiti, Susana. (Cordoba National U., Inst. of Chemical Sciences, Argentina) Effects of alpha-methyl tyrosine and adrenergic blocking agents on the facilitatory action of amphetamine and nicotine on learning in rats. *Psychopharmacologia*, 1971, Vol. 19(3), 231-240.—DL-amphetamine sulfate (2 mg/kg) and nicotine (2 mg/kg) showed a facilitatory action on the acquisition of a CR in a shuttle-box by white albino rats. This was reversed by pretreatment with α -MT (DL α -methyl-p-tyrosine) (30 mg/kg). Pretreatment with dibenamine (10 mg/kg) impaired the action either of amphetamine or nicotine. Nethalide (5-10 mg/kg) exerted a partial protection on the depressant effect produced by the interaction between dibenamine and nicotine. Ss treated with α -MT (30 mg/kg) and kept in the cold (4-6° C for 3 hr) also showed a depressed learning capacity. DL-Dopa (200 mg/kg) provided a partial protection on the depressive effects caused by the interaction of α -MT with amphetamine, nicotine, or cold. It is suggested that the facilitatory learning action of amphetamine and nicotine involves a common adrenergic mechanism. The depressant effects of amphetamine, nicotine or cold after α -MT treatment are attributed to depletion of "functional pools" of catecholamines. (33 ref.)—*Journal abstract*.

2477. Overton, Donald. (Temple U., Medical School) High education. *Psychology Today*, 1969(Nov), Vol. 3(6), 48-51.—Rats can learn incompatible responses to the same stimulus if they learn one in a drugged condition and the other in a nondrugged condition. The condition and the other in a nondrugged condition. The animal's response can be switched back and forth between these 2 responses by testing it in either a drugged state or a nondrugged state. A response learned under 1 drug may be performed under a different drug. The drugs that produce state-dependent learning in animals are the same ones that produce psychological dependence or addiction in man. (E. J. Bruner)

2478. Peeke, Harman V., LeBoeuf, Burney J., & Herz, Michael J. (U. California, San Francisco) The effect of strychnine administration during development on adult maze learning in the rat: II. Drug administration from Day 51 to 70. *Psychopharmacologia*, 1971, Vol. 19(3), 262-265.—Strychnine sulphate, administered to 26 male Long-Evans rats during development from Day 51-70 affected the rate of maze learning in

adulthood. Ss given the drug in a rich environment learned the maze at a faster rate and with fewer errors than Ss treated with the same drug that reared in a laboratory cage. The performance of 24 Ss given the drug was intermediate to that of the drug-naïve and drug-caged groups. —*Journal abstract*.

2479. Roldán, F., Radli-Weiss, T., & Chocholová, L. (Czechoslovak Academy of Sciences, Inst. of Pharmacology, Prague) Influence of chlordiazepoxide on paroxysmal EEG activity induced by hippocampal and/or thalamic cobalt loci. *Psychopharmacologia*, 1971, Vol. 19(3), 266-272.—Studied the influence of chlordiazepoxide (librium) on the paroxysmal 7-9/sec spike and wave and polyspike EEG discharges induced by chronic cobalt-gelatin implantation into the dorsal hippocampus and/or nonspecific thalamus in 31 Wistar albino rats with electrodes in the frontal cortex, dorsal hippocampus, and the mesencephalic reticular formation. Both low (1.5-9 mg/kg ip) and high (9-15 mg/kg ip) doses of chlordiazepoxide reduced the incidence of paroxysmal EEG manifestations and shortened their duration (when present). Both effects were more pronounced after lower doses. The frequency of spike-wave complexes or spikes within the paroxysmal EEG discharges did not change systematically after chlordiazepoxide. The influence of the drug on the paroxysmal discharges is independent of whether the EEG after chlordiazepoxide is desynchronized or synchronized. In the latter case desynchronization of the EEG by reticular stimulation does not facilitate the occurrence of paroxysmal EEG discharges. —*Journal abstract*.

2480. Roldán, F., Radli-Weiss, T., & Chocholová, L. (Czechoslovak Academy of Sciences, Inst. of Pharmacology, Prague) The influence of barbiturates on paroxysmal EEG activity induced by hippocampal and/or thalamic cobalt loci. *Psychopharmacologia*, 1971, Vol. 19(3), 273-281.—Induced epileptiform, 2 sec spike and wave and polyspike EEG discharges in 31 male albino rats by chronic cobalt-gelatin implantation into the dorsal hippocampus and/or nonspecific thalamus. Low doses of all barbiturates and the potent (70-150 mg/kg) barbital reduced the incidence of the epileptiform discharges simultaneously with the suppression of slow wave EEG activity. After desynchronization by reticular sensory stimulation the paroxysmal EEG patterns then reappeared. The presence of these waves with a reduction of slow wave and partial sleep phases made it difficult to measure the duration of the effect. Low doses of barbiturates seemed to shorten the 7-9/sec spike and wave and polyspike discharges mainly indirectly by depressing the level of arousal. High doses (150-500 mg/kg) of the barbiturates caused an almost complete disappearance of the epileptiform manifestations lasting for several hr. The frequency of spike and wave complexes or spikes within the epileptiform episodes (when present) suddenly increased after barbiturate administration. In the last 10 days the incidence of low doses of barbiturates in increasing suppression of the incidence of the paroxysmal discharges was sometimes observed together with the appearance of epileptiform movements. During the last 24 hr of methohexal administration doses reduced the incidence of spike and wave discharges lasting for several minutes. —*Journal abstract*.

2481. Shilito, Elizabeth E. (Agricultural Research Council, Inst. of Animal Physiology, Cambridge, England) The effect of parachlorophenylalanine on

social interaction of male rats. *British Journal of Pharmacology*, 1970(Feb), Vol. 38(2), 305-315.—Juvenile male rats treated with parachlorophenylalanine showed hair loss round the head and neck extending down the chest and abdomen. Treated isolated Ss did not have this loss of hair, while untreated Ss living in the same cage as treated Ss lost their hair. The loss therefore seems to be caused by increased social behavior. This consists of a greater frequency of chasing each other, rolling over, and social grooming. Adult male rats show an increase in mounting after treatment with parachlorophenylalanine, and this change in behavior was counteracted by treatment with 5-hydroxytryptophan. It is concluded that 5-hydroxytryptamine inhibits sexual behavior in male rats. The increase in social interaction seen in juvenile Ss may be the behavioral precursor of adult sexual behavior. Atropine 2.5 mg/kg blocked all forms of social interaction in adult male Ss, although other activity was not altered.—*Journal abstract*.

2482. Sinitsyna, L. N. (Kirov Medical Inst., Gorki, USSR) Vliyaniye morfina na eksperimental'nye aritmii, voznikayushchie pri élektricheskoi stimulyatsii razlichnykh struktur golovnogogo mozga. [Influence of morphine on experimental arrhythmias when different cerebral structures are electrically stimulated.] *Farmakologiya i Toksikologiya*, 1970(Nov), Vol. 33(6), 683-690.—Immobilized adult cats were used to study the influence of iv administered morphine on rhythmic disturbances of cardiac activity arising with electrical stimulation of structures in the cerebral cortex, di- and mesencephalon. Electrical stimulation of the sensorimotor zone of the cerebral cortex and of structures in the midbrain, thalamus, sub- and hypothalamus produced rhythmic disturbances of cardiac activity. With additional stimulation of structures in the thalamus and midbrain, superimposed upon arrhythmia, an inhibitory effect emerged, expressed in the restoration of the normal EKG. 1-5 mg/kg morphine reduced or completely blocked arrhythmia when the cortical sensorimotor zone and subthalamus were stimulated. With stimulation of structures in the thalamus and midbrain after the injection of 5-10 mg/kg morphine, an increase in rhythmic disturbances of cardiac activity was observed, accompanied by a reduction of the inhibitory effect. 15-20 mg/kg morphine reduced arrhythmias emerging with stimulation of structures in the thalamus and midbrain. (English summary) (24 ref.)—*I. D. London*.

2483. Stolerman, I. P. (University Coll., London, England) A method for studying the influences of drugs on learning for food rewards in rats. *Psychopharmacologia*, 1971, Vol. 19(4), 398-406.—Describes a standardized procedure for assessing quantitatively the acquisition of lever-pressing for food rewards in male hooded rats. Training was carried out by automatic equipment throughout, without shaping the performance of individual Ss, and was broken down into stages of habituation to the test chamber, learning of the magazine response, and learning to associate lever presses with operations of the food magazine (on a CRF schedule). Lever-pressing rate was the main measure of performance, but approaches to the reward area and general motor activity were also recorded. Both the spontaneous rate of lever-pressing and the speed with which the magazine response was carried out were correlated with the subsequent performance under CRF, and might therefore be useful for predicting individual differences

in acquisition. Chlorpromazine and chlordiazepoxide both depressed performance during acquisition, but the mechanisms involved were probably different for the 2 drugs. These may be analyzed further by comparing effects on acquisition with those on established performance, and by testing for dissociation of learning. (25 ref.)—*Journal abstract*.

2484. Tilson, H. A. & Sparber, S. B. (U. Minnesota) Differences in tolerance to mescaline produced by peripheral and direct central administration. *Psychopharmacologia*, 1971, Vol. 19(4), 313-323.—Used a fixed-ratio schedule of food reinforcement to study the differences in tolerance produced by peripheral injections and intraventricular infusions of mescaline hydrochloride in 3 male albino Sprague-Dawley rats. Successive daily administrations of 10 mg. mescaline/kg ip resulted in a decrease in behavioral disruption (tolerance). The following day, intraventricular infusion of a dose of mescaline, previously shown to be approximately equal to the peripheral dose in terms of behavioral disruption, was started. After tolerance to central administration of mescaline was established, 10 mg/kg of mescaline injected ip resulted in behavioral disruption equal to that produced by the 1st ip injection. In Exp. II, with 5 Ss, blood pressure effects of mescaline given ip and intraventricularly were studied. Peripherally administered mescaline produced marked effects on caudally measured blood pressure and increased biting upon and struggling within the restraining device. Mescaline administered centrally did not appear to elicit similar cardiovascular changes. Data suggest that different mechanisms may be involved in the formulation of tolerance to mescaline administered by these 2 routes as measured by means of a fixed ratio reinforcement schedule. (17 ref.)—*Journal abstract*.

2485. Uyeno, Edward T. (Stanford Research Inst., Menlo Park, Calif.) Relative potency of amphetamine derivatives and N, N-dimethyltryptamines. *Psychopharmacologia*, 1971, Vol. 19(4), 381-387.—Evaluated the relative potency of amphetamine derivatives and N,N-dimethyltryptamine (DMT) derivatives in 100 male Long-Evans rats trained to swim through an underwater tube to escape at the other end of the tank. All of the compounds tested significantly increased the starting latency. The time of peak effect of 2,5-dimethoxy-4-ethyl-amphetamine (DOET), 2,5-dimethoxy-4-methyl-amphetamine (DOM), and 6-hydroxy-DMT was estimated at 40 min. after the ip injection and that of DMT, 4-methoxy-DMT, and psilocybin was 20 min. Dose-response curves showed that the increase in the latency was dose-dependent. The descending rank order of potency of the compounds, according to the median effective dose (ED₅₀), was: DOET, psilocybin, DOM, DMT, 4-methoxy-DMT, and 6-hydroxy-DMT.—*Journal abstract*.

2486. van Abeelen, J. H., Smiths, A. J., & Raaijmakers, W. G. (U. Nijmegen, Genetics Lab., Netherlands) Central location of a genotype-dependent cholinergic mechanism controlling exploratory behaviour in mice. *Psychopharmacologia*, 1971, Vol. 19(4), 324-328.—Peripheral administration of scopolamine tended to reduce the frequencies of 3 exploratory acts in males of the mouse strain C57BL/6 and to increase them in strain DBA/2, whereas methylscopolamine was ineffective. Physostigmine diminished these exploratory scores in both genotypes, whereas neostigmine had no such effects. These observations support the hypothesis

of a genetically controlled cholinergic mechanism which is located in the brain and which facilitates exploratory behavior in mice.—*Journal abstract.*

2487. Wahlström, Göran. (U. Uppsala, Sweden) **Changes in a hexobarbital anaesthesia threshold in rats induced by repeated long-term treatment with barbitol or ethanol.** *Psychopharmacologia*, 1971, Vol. 19(4), 366-380.—Determined the quantity of iv infused hexobarbital needed to produce a burst suppression of 1 sec. or more in the EEG in male Sprague-Dawley rats after chronic barbitol or ethanol treatments. The ensuing "sleeping times" were also recorded. At the end of the 1st treatment with barbitol (200 mg/kg/day ip for 5 wk. the hexobarbital thresholds had increased by approximately 45% compared with a preexperimental average. The thresholds were back to normal after approximately a wk. At the end of a 2nd treatment with barbitol there was a similar immediate increase in threshold. 3 wk. after the 2nd treatment there was also a new increase in threshold. The ensuing sleeping times were unaffected. Ethanol treatment (10% W/V in the drinking water allowed twice 1 hr. each day for 16 wk.) caused a gradual increase in threshold which reached a maximum (20%) around Day 9-10 after the end of the treatment. 2 wk. after the ethanol treatment the thresholds were essentially normal. In an earlier barbitol treated group a 2nd slightly larger increase was also seen around 3 wk. after the end of the ethanol treatment. In this group an increase was also seen in the ensuing sleeping times but this increase seemed to be unrelated to the increases in threshold. These late changes in threshold after a 2nd treatment seem to be due to a summation of changes induced by the 2 treatments. In this respect ethanol and barbitol are probably related. They are, however, not identical with respect to their effects on the hexobarbital threshold after interruption of chronic treatment. This is shown by the longer latency of the immediate changes after ethanol treatments. (21 ref.) *Journal abstract.*

2488. Yoshimura, Hidetoshi; Mori, Masa-Aki; Oguri, Kazuta, & Tsukamoto, Hisao. (Kyushu U., Fukuoka, Japan) **Metabolism of drugs-LXV: Studies of the urinary conjugated metabolites of codeine.** *Biochemical Pharmacology*, 1970(Jul), Vol. 19(7), 2353-2360. Performed the detection and estimation of urinary metabolites of codeine in rabbits, guinea pigs, rats, and mice by thin-layer and gas chromatography. It was found that the conjugated metabolites in all species examined consisted of codeine glucuronide and morphine-3-glucuronide. Other conjugated metabolites could not be demonstrated. The amounts of codeine, morphine, codeine glucuronide, and morphine-3-glucuronide which were excreted/24-hr urine were estimated by gas chromatography to be about 3.5, 5, 11, and 29%, respectively, for rabbits; 2, 13, and 4.5% for guinea pigs; and 6, 7, 1, and 19% for rats. *Journal abstract.*

ENVIRONMENT & STRESS

2491. Dantsig, N. M. & Skobareva, Z. A. (Soviet Inst. of General & Communal Hygiene, Moscow, USSR) **K probleme gigenicheskogo normirovaniya optimal'nykh uslovii osveshcheniya.** [On the problem of setting up hygienic standards for optimal lighting conditions.] *Vestnik Akademii Meditsinskikh Nauk SSSR*, 1970(Dec), Vol. 25(12), 32-39.—Discusses the problems encountered in determining standards for the optimal lighting of premises serving a variety of purposes and the various findings of research on this topic. The methods of "physiological optics, psychophysiology and of general biological observation" should be employed. (English summary)—J. D. London.

2492. Docktor, Robert & Sharkey, Brian J. (U. Montana) **Note on some physiological and subjective reactions to exercise and training.** *Perception & Motor Skills*, 1971(1 Feb), Vol. 32(1), 233-234.—Progressive exercise training on the treadmill seemed to reduce both the catecholamine excretion and the subjective effort ratings associated with the exercise for 5 healthy but nonathletic college men.—*Journal abstract.*

2493. Gallusio, Eugene H. (Louisiana State U.) **Retrograde amnesia induced by electroconvulsive shock and carbon dioxide anesthesia in rats: An attempt to stimulate recovery.** *Journal of Comparative & Physiological Psychology*, 1971(Apr), Vol. 75(1), 136-140.—Trained 96 male albino rats to press a lever for a sucrose reinforcement. Following training a lever press produced (a) a footshock, (b) an ECS, (c) carbon dioxide (CO₂) anesthesia, (d) footshock plus ECS, (e) footshock plus CO₂ anesthesia, or (f) no treatment. The ECS plus (C) anesthesia or (f) no treatment. The ECS produced retrograde amnesia (RA) in the lateral passive avoidance learning situation but (C) anesthesia failed to do so. Partial recovery from ECS-induced RA was effected by a "reminder" shock administered 4 hr following ECS treatment. Recovery indicates that trauma induced memory loss may not be due to destruction of the memory, as is implied by consolidation theory, but may be due to disruption of retrieval processes necessary for the expression of the memory. *Journal abstract.*

2494. Jacobs, Barry L. & McGinty, Dennis J. (Veterans Administration Hosp., Sepulveda, Calif.) **Effects of food deprivation on sleep and wakefulness in the rat.** *Experimental Neurology*, 1971(Feb), Vol. 30(2), 212-222.—Studied the effects of prolonged total food deprivation on paradoxical sleep (PS), slow wave sleep (SWS), and wakefulness in male Sprague-Dawley albino rats. Analysis of sleep and waking patterns was based on daily 3-hr recordings of EEG, electrodermogram, and EMG activity. The amount of wakefulness increased monotonically in a positively accelerating curve as a function of deprivation while the amount of sleep declined reciprocally. After 6-11 days of food deprivation virtually all sleep had disappeared, with PS always disappearing before SWS. Ss that did not eat spontaneously when offered food ad libitum after the disappearance of sleep died within the next 24 hr. SWS declined gradually during the 1st few days of food deprivation and then rapidly declined toward 0. However, PS significantly increased in amount on the 1st day of deprivation and then stayed at approximately control

level until 2 days before it disappeared completely. On the day after the return to ad libitum food, PS increased substantially above control level while SWS remained below control. (19 ref.)—*Journal abstract*.

GENETICS

2496. Molchanov, A. M. (Inst. of Biological Physics, Pushchino, USSR) **Upravlenie i adaptatsiya.** [Control and adaptation.] *Biofizika*, 1970(May), Vol. 15(3), 497-502.—Discusses the "evolutionary aspect of the problem of control," where control is viewed as the "development of an extreme asymptotic form of adaptation." The mathematical model is presented, and the evolution of the control system under unfavorable conditions is discussed.—*J. D. London*.

2497. Richter, Curt P. (Johns Hopkins U. Hosp., Henry Phipps Psychiatric Clinic) **Inborn nature of the rat's 24-hour clock.** *Journal of Comparative & Physiological Psychology*, 1971(Apr), Vol. 75(1), 1-4.—Studied the "clock" which in Norway rats, and many other organisms, measures time in units of 24 hr. and subunits of 12 hr. Under ordinary conditions, this device keeps time independently of all external and internal disturbances except light. To determine whether exposure to alternating periods of light and darkness of day and night plays any role in establishing this clock, tests were made on 20 rats blinded just after birth and on 6 congenitally blind rats. Both groups manifested this clock by alternating 12-hr phases of activity and inactivity. Results indicate that (a) the clock is inherent; (b) that it must have been built into the nervous system by a survival process in relation to alternating periods of light and darkness of day and night; and (c) that it must have originated in early evolutionary eras in the tropics where day and night have the same length, i.e., 12 hr.—*Journal abstract*.

PERSONALITY CORRELATES

2498. Beyra, Marcelo & Crommelinck, Marc. (U. Louvain, Lab of Neurophysiology, Belgium) **Psychophysiologie des émotions.** [Psychophysiology of emotions.] *Revue de Psychologie et des Sciences de l'Éducation*, 1970, Vol. 5(4), 427-447.—The psychophysiology of emotions utilizes many investigation techniques applied to animals as well as to man. Such types of emotional behaviors as reactions of pleasure, aggression, alarm, fear, flight reactions and inhibitions have been induced by electrical and pharmacological stimulation of a great number of brain structures. Moreover, intracranial self-stimulation behavior is described in man and animal. Another frequently utilized technique consists of excluding cerebral structures either functionally or anatomically in order to observe possible changes in emotional reactivity. Recording of brain structures activity during emotional reactions is revealing itself as a new means of studying organic factors conditioning emotional behavior. It is suggested that emotions might play the role of a signal of well-oriented performance. (Flemish summary) (3 p. ref.)—*English summary*.

2499. Gray, Jeffrey A. (Inst. of Experimental Psychology, Oxford, England) **The psychophysiological basis of introversion-extraversion.** *Behaviour Research*

& Therapy, 1970(Aug), Vol. 8(3), 249-266.—On both psychological and physiological grounds it is suggested that the hypothesis in Eysenck's theory of introversion-extraversion attributing greater conditionability to the introvert should be replaced by the hypothesis that the introvert is relatively more sensitive to punishment and to frustrative nonreward. The data on which this conclusion is based stem chiefly from the study of eyeblink conditioning in man as a function of personality, and from the study of physiological locus of action of the extroverting drug, sodium amobarbital, in animals. It is suggested that the physiological basis of introversion includes, besides the ascending reticular activating system, an inhibitory system comprising the orbital frontal cortex, the medial septal area, and the hippocampus. This system is able to carry out the essential psychological functions believed by Eysenck to underlie introversion-extraversion. A new conception of neuroticism as reflecting degree of sensitivity to both reward and punishment is also proposed.—*A. Barclay*.

2500. Karli, Pierre. (National Center of Scientific Research, Neurophysiology Lab., Strasbourg, France) **Neurophysiologie des motivations.** [Neurophysiology of motivations.] *Revue de Psychologie et des Sciences de l'Éducation*, 1970, Vol. 5(4), 395-426.—Discusses the notion of "motivation." The role played by the hypothalamus in the elaboration of motivation states is analyzed: recent acquisitions concerning the problem of "hypothalamic behavior centers" and of positive and negative reinforcement systems in the hypothalamus are exposed and discussed. The part taken by the limbic system in the genesis of motivation is studied: effects of limbic system lesions on alimentary, sexual, and aggressive behaviors are successively analyzed. (Flemish summary) (4 p. ref.)—*English summary*.

2501. Marton, Lajos & Urbán, János. (Hungarian Academy of Sciences, Inst. of Psychology, Budapest) **Személyiség típusokra jellemző EEG-minták elemzése nyugalmi és elemt. tanulási helyzetekben.** [Analysis of EEG-samples characteristic of personality types in resting state and elementary learning activity.] *Pszichológiai Tanulmányok*, 1967, No. 10, 165-169.

2502. Richard, Wayne C. (U. Florida) **An approach to the study of personality integration and autonomic responsivity.** *Journal of Consulting & Clinical Psychology*, 1971(Apr), Vol. 36(2), 298.—Compared physiological arousal in 45 fraternity members selected for high, average, and low scores of Duncan's Personality Integration Reputation Test. Heart rate, skin temperature, and GSR were measured under various conditions of stress. Results indicate that (a) the low group showed greater reaction as measured by skin temperature change, (b) the average group more quickly reached peak RT in the mental arithmetic task, (c) the mental arithmetic task elicited shorter RTs than other stimuli, (d) skin temperature was the slowest and most reliable modality to response, and (e) greater heart rate changes occurred when discussing social data and working mental arithmetic problems than when discussing the future. It is concluded that multiple criteria for identification of optimal adjustment may be more valid than the use of a single measure.—*S. Knapp*.

2503. Thomas, Caroline B., Jones, Leona W., & Ross, Donald C. (Johns Hopkins U., Medical School) **Studies on figure drawings: Biological implications of structural and graphic characteristics.** *Psychiatric Quarterly Supplement*, 1968, Vol. 42(2), 223-251.—Invest-

gated biological correlates of structural and graphic characteristics of figure drawings by healthy young adults. Differences between drawings by men and by women were the most outstanding. Minimal differences were found between drawings by smokers and by nonsmokers. Measurements of height and body proportion of figure drawings showed little or no correlation with the physiological and metabolic characteristics of the Ss. The final significance of these findings remains to be ascertained. (16 ref.)—D. Prager.

NUTRITION & GASTROINTESTINAL PROCESSES

2504. Carlisle, Harry J. (U. California, Santa Barbara) **Fixed-ratio polydipsia: Thermal effects of drinking, pausing, and responding.** *Journal of Comparative & Physiological Psychology*, 1971(Apr), Vol. 75(1), 10-22.—Tested daily 8 female Sprague-Dawley rats on fixed-ratio schedules of food reinforcement using 3 different test procedures. Water intake increased with the severity of the response demand for all tests. Hypothalamic temperature increased within a session, but was not greatly different as a function of the magnitude of the response demand, the availability of water, or polydipsia. A fall in temperature was associated with pausing or drinking, while responding was associated with a rise. Ss were not grossly hyperthermic since peak hypothalamic temperature exceeded 39°C only by a few 10ths of a degree. Results indicate that it is unlikely that polydipsia is a response to thermal stress although the possibility remains that excessive drinking or pausing can mitigate the elevation in body temperature caused by an intermittent food-reinforcement schedule. (28 ref.)

2505. Myer, James S. & Kowell, Arthur P. (Johns Hopkins U.) **Loss and subsequent recovery of body weight in water-deprived snakes (*Elaphe obsoleta obsoleta*).** *Journal of Comparative & Physiological Psychology*, 1971(Apr), Vol. 75(1), 5-9.—Placed 8 food-deprived black rat snakes on a schedule of 5 day water-deprivation periods followed by drinking tests in a runway and 2-day periods with water in their cages. Mean body weight loss during 5 successive deprivation periods was almost invariant, and mean recovery on the drinking tests closely matched weight loss. Latency to drink decreased over successive tests. Ss were then water deprived for 5-, 12-, and 19-day periods, each followed by a drinking test and 2-days access to water. Recovery on the drinking tests was proportional to weight loss, and the mean weight recovered on the tests did not differ significantly from the levels maintained during the subsequent periods of access to water, indicating that water loss was accurately replaced at the 1st opportunity.—Journal abstract.

2509. Martino, Luigi & Perio, Bernardo (I. Agraria Inst. of Embriology & Histology Inst.) **Topografia cranio-encefalica tridimensionale in animali da esperimento [Tridimensional encephalic topography in laboratory animals.]** *Rivista di Neurobiologia*, 1970(Jul), Vol. 16(3), 267-328.—Coordinated for the 1st time a systematic study of encephalic and behavioral topography using the heads of rabbits, guinea pigs, and rats. The study is called *Atlas of Encephalic Maps* and includes over 100 pictures, diagrams, and tables. The proportional cranium metric process was used, because it is the only method able to give an objective measurement. "Numbers is the language with which Nature makes her laws known to us." Exact measurements of spherical and encephalic formations are given in each type of animal, and are compared to one another and then to man's. (English summary) (33 ref.)—A. M. Farag.

2510. Ploog, Detlev (Max Planck Inst. für Psychiatrie Munich, W. Germany) **Psychobiologie des Partnerschaftsverhaltens.** [Psychobiology of partnership behavior.] *Neurosci. Biobehav. Rev.*, 1970, Vol. 4(6), 411-255.—Partnership interactions are divided into communications by languages and signals. The latter are common with animals, and experiments provide a study of the reproductive cycles of songbirds and the ontogeny of monkeys are reported. For further investigation of human social behavior, it is suggested that methods be developed for studying verbal and nonverbal information transfers. Tests were made with healthy adults and with healthy and sick children to study adults and with healthy and sick children to study adults. The visual contacts and behavior of a distance. The influence of the expression of the eye and of the body bearing in connection with verbal messages was tested. The behavior of a child was reported concerning the control of treating a 4-year-old child. They were made for studying a few ideas concerning psychobiology of partnership between social behavior and language in the context of a brain psychobiology examination. The existence of a cerebral representation for response by social behavior is discussed. (18 ref.)—P. van Tol.

2511. Winkler, Wolfgang (Max Planck Inst. für Physiologie der Behavior, New York Station, W. Germany) **Regressionen als normale Elemente des Sozialverhaltens.** [Regression as normal elements of social behavior.] *Praxis der Psychotherapie, Fortschritte der Psychotherapie*, 1970, Vol. 18(4), 150-151.—Comparative examination of various socially-living vertebrates have shown that certain regular behavior elements serve for the regulation of their sexuality. These elements are of primary importance for the development of the species. The new but not developed forms have different positions. The breed is related to the development of the species which breed is related to the development of the species. It is suggested that the development of the species is related to the development of the species. The development of the species is related to the development of the species. It is suggested that the development of the species is related to the development of the species. It seems that regression belongs to the normal behavior of

human beings as well, in spite of the fact that it can assume pathological dimensions.—*P. von Toal.*

NATURAL OBSERVATION

EARLY EXPERIENCE

2513. Brown, Cheryl & Jackson, Donald E. (Eastern Michigan U.) The effects of high-intensity noise in early development upon behavior in the adult rat. *Proceedings of the Annual Convention of the American Psychological Association*, 1971, Vol. 6(Pt. 1), 207-208.—Following 30 days (age 26-56 days) of either high-intensity noise exposure or control conditions, 38 rats were subsequently either trained in a U maze or tested in an open field. Analysis of variance revealed significant Noise and Noise \times Sex interaction effects on U maze performance. No differences in the open field test were observed. These results suggest a differential sex effect of noise on subsequent learning where emotional factors have been controlled.—*Author abstract.*

2514. Cappell, Howard D. (Columbia U.) Effects of early handling and social living on affiliation in the rat. *Dissertation Abstracts International*, 1970 (Dec), Vol. 31(6-B), 3722-3723.

2515. Chakrapani, T. K. (Aiyar's Advertising & Marketing Pvt. Ltd., Bombay, India) Resistance to stress as a function of infantile stress experience: An experimental study. *Psychology Annual*, 1970 (Mar), Vol. 4, 7-9.—Examined whether infantile anoxic stress increases the ability of an S to withstand subsequent stress. 144 Wistar albino rats were tested in 12 groups. 8 groups were subjected to 2 levels of anoxia at 4 developmental periods and the remaining groups served as controls. After 3 mo. of anoxia, all Ss were deprived of food and water for 120 hr. No significant differences were found in the mortality rate between Ss subjected to anoxia and the controls.—*S. Knapp.*

2516. Fullerton, Clare; Berryman, Julia C., & Sluckin, W. (U. Leicester, England) Peeping in chicks as a function of environmental change. *Psychonomic Science*, 1970 (Oct), Vol. 21(1), 39-40.—Measured peeping in 1- and 4-day-old chicks in 4 different testing conditions. No differences were found between the 2 ages, but peeping increased markedly with the degree of environmental change. 80 Ss were tested. This latter variable may have been overlooked in past work because of the prevailing interest in changes of behavior as a function of disruption of social imprinting bonds.—*Journal abstract.*

INSTINCTS

2517. Manosevitz, Martin. (U. Texas) Hoarding: An exercise in behavioral genetics. *Psychology Today*, 1970 (Aug), Vol. 4(3), 56-58, 76.—Studied the hoarding behaviors of several strains of mice using a standardized procedure. The data indicate that genetic influences accounted for $1/3$ to $1/2$ of the observed hoarding behavior. Submitting the different strains to standard environmental manipulations showed that genetic dif-

ferences interact with nurture to produce increases or decreases in hoarding behavior depending on the strain. It is concluded that there probably is an optimal environment which would lead to the full development of an individual's genetic potential.—*E. J. Posavac.*

2518. Shapiro, Lorin J. (Texas Christian U.) The effect of various durations of enforced exposure to a stimulus object on the reversibility of the following response in white Peking ducklings. *Dissertation Abstracts International*, 1970 (Dec), Vol. 31(6-B), 3739.

2519. Stern, Jeffrey J. & Hoffman, Bonita M. (U. Michigan, Dearborn) Effects of social isolation until adulthood on maternal behavior in guinea pigs. *Psychonomic Science*, 1970 (Oct), Vol. 21(1), 15-16.—Separated 5 female guinea pigs from their mothers at birth and reared them in social isolation until adulthood. Following impregnation and parturition, the maternal behavior of these Ss was compared to that of a mother-reared group. No differences were found on nursing time, nursing posture, pup-oriented responses, or on weight gain of offspring.—*Journal abstract.*

MOTIVATION & EMOTION

2520. Ashton, Alan B., Gandelman, Ronald, & Trowill, Jay A. (Saginaw Valley Coll., University Center, Mich.) Effect of food deprivation upon elation of saccharin drinking following a temporary shift to water. *Psychonomic Science*, 1970 (Oct), Vol. 21(1), 5-6.—Elation of saccharin intake was seen after a temporary shift to water in 60 nondeprived rats, but not after a temporary absence of solutions, or after a temporary shift to an empty drinking tube. 2 different groups of 12 female albino rats served in 2 experiments. Deprivation tended to attenuate elated responding after a water shift. The relationships of the present design to others involving reinforcement shifts were discussed.—*Journal abstract.*

2521. Dube, Rodney; Ashton, Alan B., & Trowill, Jay A. (U. Massachusetts) Responses to palatability shifts: Effects of varying the retention level. *Psychonomic Science*, 1970 (Oct), Vol. 21(1), 10-12.—Gave nondeprived rats a 1-hr exposure to a sodium-saccharin solution for 28 consecutive days. Male albino rats served as Ss in Exp. I and II ($N = 6, 6$), and 16 female albino rats served as Ss in Exp. III. A temporary shift to tap water then occurred for all Ss. The brief timeout (tap water) led to a positive contrast effect. Lengthy exposure to tap water (30 days) resulted in the possible forgetting of the comparison solution (saccharin) or perhaps the response to that solution.—*Journal abstract.*

2522. Dunlap, William P. & Frates, Sarah B. (Tulane U.) Influence of deprivation on the frustration effect. *Psychonomic Science*, 1970 (Oct), Vol. 21(1), 1-2.—Compared groups of male albino rats under 0-hr food deprivation to groups under 22-hr food deprivation. A running to sucrose-pellet reward in the double alley. A total of 24 Ss were used. In addition to experimental groups switched from continuous to 50% reinforcement in the 1st goalbox (GB1), control groups never receiving reward in GB1 were used under both deprivation conditions. A substantial frustration effect (FE) was found for the 22-hr deprived groups; however, no reliable evidence of the FE was found with 0-hr deprived groups.—*Journal abstract.*

2523. Jones, Elhis C. (Frostburg State Coll.) Effects of ingesting nonnutritive sweet substances on

subsequent sucrose consumption. *Psychonomic Science*, 1970(Oct), Vol. 21(1), 23-24.—Conducted an experiment with 50 male Sprague-Dawley rats to verify and further study the drive-reducing effects of non-nutritive sweet substances. Ingestion of 1 ml. of .25% pure saccharin or .6% sodium cyclamate solutions significantly suppressed subsequent consumption of a 16% sucrose solution. Data also indicate that the suppression effect following consumption of saccharin disappears within 5 min. It is concluded that the transitory effects of saccharin consumption may account for discrepancies between previous studies on the drive-reducing effects of saccharin. (15 ref.)—*Journal abstract*.

2524. **Latto, Richard.** (U. Cambridge, Psychological Lab., England) **Visual search in monkeys.** *Perceptual & Motor Skills*, 1971(Feb), Vol. 32(1), 307-312.—6 monkeys were trained to search a visual display for a target stimulus. Their search time increased linearly with the number of irrelevant stimuli (N) and at 60 msec/item was comparable to the performance of man on similar tasks. Error scores were not linearly related to N, nor did they change in a systematic way as N increased.—*Journal abstract*.

2525. **Levison, Cathryn A.** (U. Chicago) **The development of head banging in a young rhesus monkey.** *American Journal of Mental Deficiency*, 1970(Nov), Vol. 75(3), 323-328.—Describes the development of head banging in a male rhesus monkey which had been reared under conditions of early social and visual deprivation, but which had, after release from deprivation, exhibited no stereotyped behaviors. Head banging developed as a consequence of a particular set of interactions with the E and subsequently generalized to other related areas of behavior.—*Journal abstract*.

2526. **Loop, Michael S.** (Florida State U.) **Effects of deprivation on the tongue flicking and orientation of young rat snakes to water.** *Psychonomic Science*, 1970(Oct), Vol. 21(1), 49-51.—Deprived 6 young rat snakes (Elaphe) of water for 6 days and then tested them by placing a dry cotton swab and a swab dipped in distilled water 1 cm. in front of the snake's snout. 2 measures, approach/tongue flick and approach orientation, revealed that the water elicited higher responding than the dry stimulus. 8 Ss were then tested over a 10-day period. The stimulating effectiveness of water under deprivation was found to decline at 1st and then increase until ad lib water was returned. It is concluded that water is an effective stimulus for the snake's chemoreceptors but would elicit responding only under conditions of deprivation.—*Journal abstract*.

2527. **Roediger, Henry L. & Stevens, Michael C.** (Yale U.) **The effects of delayed presentation of the object of aggression on pain-induced fighting.** *Psychonomic Science*, 1970(Oct), Vol. 21(1), 55-56.—It has been suggested that an aversive stimulus produces a drive to aggress in shocked organisms. Presumably this drive in state will last a short time after the pain stimulus in absence of an object of aggression. This notion was studied by presenting the object of aggression (another rat) 0, 2, 4, or 6 sec. after the cessation of the shock. Some fighting behavior was observed, regardless of when the object of aggression was presented. However, the intensity of the fighting behavior decreased markedly as delay of presentation increased from 0-6 sec. Ss were 8 albino Sprague-Dawley rats.—*Journal abstract*.

2528. **Senini, Adriano.** (Catholic U., Inst. of Psy-

chology, Milan, Italy) **Il confinamento nello "startling-box" come fattore di frustrazione.** [Confinement in the "startling box" as a factor in frustration.] *Archivio de Psicologia Neurologia e Psichiatria*, 1970(Jul), Vol. 31(4), 352-362.—Amsel's hypothesis of short-term effects of excitatory potential and of rapid decay was tested in a T maze with 24 rats. (French, English, & German summaries)—L. L'Abate.

2529. **Valle, Fred P.** (U. British Columbia, Vancouver, Canada) **Flavor preferences in laboratory rats.** *Psychonomic Science*, 1970(Oct), Vol. 21(1), 31-32.—1 group of 12 rats (Group A-B) was reared on an almond-flavored diet, a 2nd group of 12 (Group B-A) on a banana-flavored diet, and a 3rd group of 7 (Group C-C) on an unflavored diet. The groups were then given both the banana and almond diets for 2 days. Results show all 3 groups preferred almond to banana (almond preference), with Group B-A showing the strongest preference (novelty preference). Results of a 2nd set of tests, following upon an interval during which Groups A-B and B-A had their maintenance flavors switched, are generally consistent with the above, but also indicate that a diet's preferability may depend upon an interaction between its primacy, its familiarity, and its attractiveness.—*Journal abstract*.

LEARNING

2530. **Balderrama, Norberto & Maldonado, Héctor.** (Venezuelan Inst. of Scientific Investigations, Caracas) **Habituation of the delmatic response in the mantid (Stagmatoptera biocellata).** *Journal of Comparative & Physiological Psychology*, 1971(Apr), Vol. 75(1), 98-106.—When adult female mantids (Stagmatoptera biocellata) are faced with a bird, a "frightening response" is displayed called a delmatic reaction (DR). Habituation of this mantid's response due to repeated presentation of 3 different species of birds was studied. The response decrement appeared with all 3 stimuli: a decrease in the number of DRs, an increase in the percentage of incomplete responses, and a shortening in the response duration. Significant retention of the effects of habituation was found after 6 days (24 ref.)—*Journal abstract*.

2531. **Borkhuis, Mary L.** (South Dakota) **Extraneous information in pattern reproduction by monkeys.** *Dissertation Abstracts International*, 1971(Jan), Vol. 31(7-B), 4355.

2532. **Davis, Michael.** (Yale U.) **Habituation of the startle response as a function of the length and variability of the interstimulus interval.** *Dissertation Abstracts International*, 1970(Dec), Vol. 31(6-B), 3724.

2533. **Glendinning, R. L. & Meyer, Donald R.** (Ohio State U.) **Motivationally related retroactive interference in discrimination learning by rats.** *Journal of Comparative & Physiological Psychology*, 1971(Apr), Vol. 75(1), 153-156.—Trained 4 groups of 15 Long Evans hooded rats on 2-choice discrimination problems under a shock-avoidance shock-avoidance or a shock-avoidance food-approach motivational sequence. The LCS or sham-LCS treatments were delivered as Ss attained criterion on the 2nd habit. Retention tests for the 1st habit showed no motivational specific LCS effects, but habit showed no motivationally related retroactive interference was found. The amount of this interference with retention proved to be much larger than has previously been obtained with 3-habit training paradigms.—*Journal abstract*.

2534. Jensen, Philip K. (Drew U.) **Role of blind alleys in latent learning.** *Journal of Experimental Psychology*, 1971(Apr), Vol. 88(1), 133-136.—Conducted 2 experiments to investigate the extent of the role of blind alleys in complex maze latent learning studies. 51 albino and hooded male and female rats were examined in a Buxton-Haney-type study, and a replication with the effects of blind alleys removed by the use of a multiple free-path maze. Results show a strong latent learning effect in the 1st case but no such effect in the 2nd. Either cognitive or classical reinforcement theories have difficulties explaining the data. It is suggested that the simplest theory to apply is a probabilistic contiguity model.—*Journal abstract.*

2535. Kardos, Lajos; Mario, Zanfortin, & Giorgio, Poli. (Eötvös Lóránd U., Faculty of Arts, Budapest, Hungary) **Lokomóciós tanulási és térirányozási: Ekvifermínális alternatív utak jelentősége a tanulásban.** [Locomotion learning and space orientation: The significance of equiterminal alternative routes in learning.] *Magyar Pszichológiai Szemle*, 1969, Vol. 26(3-4), 443-458.—In a complex maze, rats avoided a route which had previously been blocked. An insight-type explanation is discussed.—*M. Moore.*

2536. Kirkby, Robert J. (Psychiatric Research Unit, Rozelle, New South Wales, Australia) **Learning in marsupials.** *Australian Psychologist*, 1969(Nov), Vol. 4(2-3), 155-166.—Reviews a total of 14 papers that have been reported in the area of learning and memory processes in which marsupials served as Ss, and suggests that a survey of the area indicates that (a) relatively little research has been undertaken with marsupials in comparison to that with rats, higher mammals, and invertebrates; (b) depending upon the investigation, learning ability of marsupials has been found to be either superior to, inferior to, or no different from that of laboratory rats; (c) studies typically use small groups of animals and frequently omit information regarding age, sex, or species; and (d) only 2 reported studies have investigated the Australian kangaroo, only 1 the Australian brushtail possum, and only 1 has been undertaken in Australia. The availability of marsupial Ss in Australia is discussed, and it is suggested that the failure of psychologists to make use of such sources "is perhaps indicative of the gap between 'Psychology' and the biological sciences in Australia."—*R. Wiltz.*

2537. Powell, Robert W. & Burns, Richard. (U. South Florida) **Visual factors in observational learning with rats.** *Psychonomic Science*, 1970(Oct), Vol. 21(1), 47-48.—11 albino rats learned to leverpress for food reinforcement through observation as quickly as 48 hooded rats. Hooded Ss, observing a trained rat through a screen, which reduced visibility, learned just as quickly as hooded Ss which observed the trained rat through plexiglas. Leverpressing was more quickly acquired by hooded Ss that were shaped than hooded Ss learning through observation. Results suggest that the contribution of visual observation to learning in rats is relatively minor and does not involve a high degree of visual acuity.—*Journal abstract.*

2538. Rao, T. R. (U. Mysore, India) **On correlates of learning.** *Psychology Annual*, 1970(Mar), Vol. 4, 49-54.—Studied 21 male and 42 female Wistar albino rats in open field tests, in activity and living cages, and in a water T maze. Scores of emotionality based on acquisition scores, cage behavior, and activity were analyzed. It was found that (a) high emotion Ss and male Ss

defecated more frequently than low emotion or female Ss, (b) no significant sex or emotionality differences were present in learning, and (c) retardation in learning tended to be associated with a greater amount of motor activity.—*S. Knapp.*

2539. Weinstock, Roy B. (Mary Washington Coll., Virginia) **Preacquisition exploration of the runway in the determination of contrast effects in the rat.** *Journal of Comparative & Physiological Psychology*, 1971(Apr), Vol. 75(1), 107-115.—Randomly assigned male hooded rats either to explore (EX) or not to explore (NEX) an unbaired runway before training was begun in a double-shift reward-contrast study. Ss received during training 1 of 4 reward sequences: HLH, LHL (experimental conditions), HHH, LLL (control conditions, where H indicates a 10-pellet, and L a 1-pellet reward). The 1st amount of reward in a sequence was received by the Ss over Trials 1-19 (acquisition), the 2nd over Trials 20-28 (Shift 1), and the 3rd over Trials 29-35 (Shift 2). Significant elation effects were found following the 1st shift of reward only, under both EX and NEX conditions. No depression effects occurred. EX Ss ran faster than NEX Ss throughout training. (23 ref.) *Journal abstract.*

Conditioning

2540. Akhtar, M. (Slippery Rock State Coll.) **The postsession feeding: A sustainer and an inhibitor of a free-operant.** *Proceedings of the Annual Convention of the American Psychological Association*, 1971, Vol. 66(1), 25-26.—Performance under punishment-extinction was shown to improve under an immediate and to decrease under a delayed postsession feeding ($N = 12$ male rats). The variable of delay was manipulated by introducing a 1/2-hr detention either after 9, 18, or 27 days of immediate feedings received after daily sessions. These groups were factorially combined with 2 variations of a feeding cage: home vs. "other." Home-cage feeding had a longer history and its prevention was found to be more frustrating than a prevention of other-cage feeding. Detention introduced at a later point of feeding expectancy was also more frustrating.—*Author abstract.*

2541. Asratyan, E. A. (Inst. of Higher Nervous Activity & Neurophysiology, Moscow, USSR) **Kausalnyi uslovnyi refleks.** [The causal conditioned reflex.] *Voprosy Filosofii*, 1970(Oct), Vol. 24(10), 117-126.—Discusses the documented statements of Pavlov on the higher nervous activity of anthropoids, made during laboratory seminars. These statements surely provide a basis for designating certain "associations," discerned in anthropoids, as transcending their CR origin, since they now serve to implement a "signal connection." This permits one to refer to such an association as a "causal CR," although Pavlov explicitly denied that the causal association, discerned in the anthropoids, could be called a CR. Arguments are presented to support the view that the CR nature of causality in anthropoids and man is the same.—*D. London.*

Effect of the interstimulus interval. *Journal of Comparative & Physiological Psychology*, 1970, Vol. 70(1), 129-135. Tested 16 groups of 8 Holtzman rats. Ss received 116 differential instrumental conditioning trials at various IIS followed by extinction trials to the former positive stimulus. Ss in control condition worked with Ss in experimental condition by 1 trial to non-rewarded stimulus (induction condition). In 3 sets of groups, the IIS between successive S+ trials was 1, 4, or 16 sec. In the control condition extinction speeds were higher with increased IIS in effect on apparent extinction rate. Relative to their own control group, the effect of the interposed S- trial was positive in speed in the 1-min condition and negative in speed in the 10-min condition. It is concluded that extinction positive induction may result because S- prevents the accumulation of inhibition across massed trials to the former S+.—*Journal of Experimental Psychology*.

2548. Krane, Richard V. & Ison, James R. (U. Rochester). Positive induction at different sections of the performance chain. *Psychonomic Science*, 1970 (Oct), Vol. 21(1), 37-39.—24 naive male Holtzman rats received 95 differential conditioning trials followed by 30 extinction trials. In the former S+ either in succession (control procedure) or with each S+ preceded by a trial to S- (induction procedure). In Exp. I, retention time on nonrewarded trials was 15 sec. in control and 3 sec. in induction. In Exp. II, it was 3 sec. The induction procedure generally faster response speeds and fewer reactions in extinction, these being in the former S+ trials. In Exp. III, the induction procedure was used in 2 experiments indicating that the S- trial has a facilitation effect of the induction procedure. (10 refs.) *Psychonomic Science*.

1). 21-22. In 178 male Charles River CD albino rats, single trial step-down passive avoidance varied with foot shock intensity and duration. Severe punishment led to a decline in performance. Defensive reactions elicited by the punishing stimulus may explain these results. Species specific defense reactions (SSDRs) of immobility and heightened activity (withdrawal) may develop at different severity of punishment levels. As severity of punishment increases immobility increases up to a point. Further increases in punishment lead to heightened activity. Immobility is compatible with passive avoidance whereas heightened activity is not. Thus, whether passive avoidance develops or not depends upon which type of SSDR becomes dominant.—*Author abstract*

2554. Baum, Morrie & Gordon, Arthur. (McGill U., Montreal, Quebec, Canada) Effect of a loud buzzer applied during response prevention (flooding) in rats. *Behaviour Research & Therapy*, 1970(Aug), Vol. 8(3), 287-292. In a 2×2 factorial design, 100 rats were trained to avoid shock of .5 or 1.3 mA (1 factor) following which a brief period of flooding was administered. During flooding, a loud buzzer was either continuously applied or not applied (2nd factor). Results showed that (a) stronger shock decreased the efficacy of flooding, and (b) the application of the buzzer enhanced the effectiveness of flooding in producing extinction of the avoidance response. Analysis of Ss' spontaneous behavior during flooding supported the view that it is important for the animal to engage in nonfear behavior (general exploratory activity, grooming) during flooding if the treatment is to be effective. The buzzer acted to facilitate the action of flooding by inducing greater amounts of such nonfear behavior during flooding.—*Barclay*.

2555. Brush, F. Robert. (U. Oregon, Medical School, Portland) The effects of amount of signaled escape training on subsequent avoidance learning. *Psychonomic Science*, 1970(Oct), Vol. 21(1), 51-52. Independent groups of 12 Long-Evans male rats received 0, 5, 15, or 25 trials of signaled escape training 5 min. before receiving 60 trials of avoidance training. Avoidance learning was equally facilitated in the 5-, 15-, and 25-trial groups relative to that of the 0-trial group. Results are discussed in terms of the role of escape responding in avoidance learning.—*Journal abstract*.

2556. Delprato, Dennis J. & Terrant, Frank R. (Eastern Michigan U.) Effects of preshock on subsequent passive avoidance behavior. *Proceedings of the Annual Convention of the American Psychological Association*, 1971, Vol. 6(Pt. 1), 23-24.—A step-down task was used to determine the effects of 3 pretraining conditions (inescapable preshock in the apparatus, escapable preshock, and nonpreshock) on passive avoidance. The punishing shock of the passive avoidance task was inescapable in Exp. I and escapable in Exp. II (total $N = 30$ female Sprague-Dawley albino rats). Major results: (a) preshock groups showed more response inhibition than nonpreshock groups on the 1st passive avoidance trial, (b) preshock facilitated performance when punishment was inescapable (Exp. I), (c) preshock interfered with performance when punishment was escapable (Exp. II), and (d) inescapable and escapable preshock had similar effects. Results are discussed in terms of a fear-mediated freezing mechanism and relaxation theory.—*Author abstract*.

2557. Green, Kenneth F. & Churchill, Peggy A. (California State Coll., Long Beach) An effect of flavors

on strength of conditioned aversions. *Psychonomic Science*, 1970(Oct), Vol. 21(1), 19-20.—Attempts to condition aversions to nonpreferred flavors have not been as consistently successful as when preferred flavors were used. To find if the problem is 1 of method of measurement or if it is a general characteristic in the conditioning of aversions, several measurement procedures were used to compare aversions formed by 10 female albino rats to 1 preferred and 1 nonpreferred flavor. On all measures, whether relative (decreases in intake) or absolute (final amount consumed), aversions for the preferred flavor were greater than for the nonpreferred flavor.—*Journal abstract*.

2558. Hammond, L. J. & Lambert, Joseph V. (Temple U.) Punishing effects of long delays of reinforcement with shock-escape behavior. *Psychonomic Science*, 1970(Oct), Vol. 21(1), 63-64.—32 male Sprague-Dawley rats receiving long delays of reinforcement in a shock-escape runway (30 or 45 sec. of goalbox confinement before relief) ran quite slowly on later, as compared to earlier, acquisition trials. In this sense, long delays of relief appeared to punish running. A psychological interpretation was given. In the case of escape behavior, longer delays of reinforcement may result in definitely discernible increments in shock (drive) duration, whereas in the case of rewarded behavior, a min. or more of hunger is probably above the DL based on a standard of 24 hr. of hunger.—*Journal abstract*.

2559. Levis, Donald J. (U. Iowa) One-trial-a-day avoidance learning. *Behavior Research Methods & Instrumentation*, 1971(Mar), Vol. 3(2), 65-67.—Compared a 1-trial-a-day discrete-trial avoidance conditioning procedure run for 30 consecutive days with a massed-trial procedure where Ss received 30 consecutive trials within 1 day. 20 naive male Blue Spruce rats in 2 equal groups were equated for time each S spent in the nonshock compartment of the apparatus, number of times the transport box carrying Ss was lifted out of the nonshock compartment, and the number of times each S was handled. The main difference between groups was the interession trial length of 24 hr. for the 1-trial-a-day Ss. Learning was rapid for both groups. The groups did not differ reliably on 6 acquisition indices. The methodological advantages of the 1-trial-a-day procedure and its theoretical importance are discussed. *Journal abstract*.

2560. Linton, John; Riccio, David C., Rohrbaugh, Michael, & Page, Horace A. (Kent State U.) The effects of blocking an instrumental avoidance response: Fear reduction or enhancement? *Behaviour Research & Therapy*, 1970(Aug), Vol. 8(3), 267-272.—Rats which were prevented (blocked) from making an instrumental avoidance response extinguished much more rapidly than nonblocked Ss. In a subsequent test, however, passive avoidance of the former shock chamber was much greater in the blocked Ss. When no regular extinction trials were permitted, blocking (per se) reduced residual "fear" below the level present at the end of acquisition. Considered in terms of two-process learning theory, these data suggest a need for multiple indices of behavior change.—*Barclay*.

2561. Thompson, Richard W., Galosy, Richard A., & Morlock, Gerald W. (Western Washington State Coll.) The effect of posttrial ECS and footshock on the acquisition of a nonshock passive-avoidance response. *Psychonomic Science*, 1970(Oct), Vol. 21(1), 3-4.—Exp. I, with a 2×2 factorial design of training, no

training, ECS/no ECS, investigated the effect of ECS on the acquisition of a 1-trial nonshock passive avoidance response. Ss were 40 female albino rats in 4 groups of 10 each. Results indicate passive-avoidance learning in trained Ss and that ECS produced nearly complete retrograde amnesia (RA) for the response. Exp. II, using the same design and procedure, investigated the effect of posttraining footshock (FS) on the acquisition of the passive-avoidance response. Results indicate passive-avoidance behavior for groups receiving training and no FS, training and FS, and no training and FS. There was no evidence of RA produced by FS.—*Journal abstract.*

Reinforcement

2562. Ashton, Alan, & Gandelman, Ronald J., & Trowill, Jay A. (Saginaw Valley Coll., University Center, Mich.) **Effects of reinforcement shifts upon subsequent sucrose consumption.** *Psychonomic Science*, 1970(Oct), Vol. 21(1), 7-8.—Elation of sucrose consumption was not observed among male or female rats following a temporary shift to water. A total of 3 experiments were conducted with 6 male albino rats in 2 and 16 female albino rats in 1. Data are contrary to earlier work which employed saccharin as the reward.—*Journal abstract.*
